I remember him saying to an unduly loquacious caddie, while he tapped with the handle of his driver the spot he wished to tee on, 'Young man, do your duty just *there*; and remember I regard you principally as a *tee-caddie* on two legs instead of four; but you will also hold my clubs and—your tongue!'

I had, and have still, a decided opinion on the subject of putting, and it is this: that you had better be well up in your play; that is to say, if your ball runs straight, it has the chance of getting home—travelling on the fast side though it be—which, if you play short, is altogether impossible. Carrying out this idea now and then rather energetically resulted in an occasional *gobble*, which at once called forth the remark, 'Do not attempt too much of a gobble!—Let your moderation be known to all men, whatever *course* you are at, whether it be — or Macrihanish.'

Anon, luck would give a ball that went sweetly off the bone and looked infinitely well in mid-air,

a bad lie. Ere we came up to it, the Doctor would praise the shot, but, on sighting the ball, he would quietly remark, 'Ah, there you are! No ball has yet been invented which may be said to be too good for *hanging*—if the ground lies that way.'

What can a man, who is not mighty on the links, do with a bad hanging ball? Fizzle, of course, and lose his temper too, which would call forth: 'Good for you, you have no opponent to-day; but you need not be your own, for all that. It is no paradox to say that you indicate that you are *green* if you look *blue* over a single bad shot; and even if you will allow your nose to divide the colours, they never look well together.'

Laughingly, I would say: 'It is a moral training of no mean order, this same game of golf—is it not?'

A humorous twinkle flashed across his eyes as he said: 'Certainly; and yet there are odd contradictions in it. Good temper is essential. There is a deal that is *straight* about the game—club handles, driving, putting, &c. On the other hand, knowing that honesty is the best policy, a long driver, nevertheless, will never choose an *upright* club; and you know how we all like to *steal*, when we can. Indeed, it is not only morality that is in danger, but the whole intricate system of values. For instance, if you know how to play your approaches, it is good golf patois to say that your iron is as good as gold to you—execrable nonsense in the eyes of one at least of the two men who have equal quantities of one or other of the metals to dispose of. Again, we believe in correction. Every club is the better, we all say, of a good sound *whipping*; and yet, like a very demon, we constantly exhort our partner to give us a *good lie*.'

This last sally put me in mind of a conundrum I had heard at the club-house the previous forenoon, and as I have never seen it in print, I repeat it for the benefit of the reader, as I did for the hearer. 'Why was Ananias like a good golfer?'—'Because he lay stone *dead* after a bad *lie*.'—'That is good,' the Doctor said—and bad!'

I remember on one occasion we had made up to a passionate young man who was playing a 'single' with a phlegmatic old gentleman who was known to the Doctor. The elderly golfer stood *dormy* at seven up with seven to play. Having holed out, the winner intimated the fact like a sphinx; whereupon the little fellow with the passion, the gaiters, and the red coat, broke into a volley of oaths. Dr — said in a firm and earnest tone: 'Your *bye*, sir, will begin after the next hole is lost by you; save up your strength, I advise you. There is no need of interlacing your play with *by* —, *by* — all the way. Besides, swearing doesn't help you a bit.'

I had been playing a little wildly at one hole, and had overshot the green a good way. To my own amazement, as will sometimes happen, my next shot lay—not dead, but home! 'Bravo!' cried my companion. My elation, however, was suddenly cooled by his calmly observing: 'If you do go *floundering* into the rough, and then send your ball home, off a fifty yards' iron shot, you needn't be surprised if your opponent hails your triumph as a *flake*.'

His readiness was extraordinary. Sometimes, indeed, he would speak at some length, rolling the words out slowly, as though he were reciting Milton. Again—although he never spoke swiftly—he would confine himself to a single short sentence, the inflection being always laden with point. My ball lay cupped, for instance, on one occasion, and I remember he instantly said: 'The *cup* is not a *loving-cup* in golf, and your *spoon* is simply nowhere in such a case.'

I recall, too, a neat remark which was made when my kind old friend was instructing me during the first year of my practice. I had topped a teed shot, when those words, gravely uttered, and catching nothing, as it were, from the twinkle in his eye, fell upon my ears: 'In *addressing* the ball be careful not to give it a *top-dressing*; leave that for your lawn.' At another time my play would merit the remark: 'Do not begin to *screw* before luncheon-time, and neither then nor at any other time let the past tense of the verb be applicable to you.' He was not a teetotaler; but he had, I think, a more bitter contempt for hard drinkers than for any other set of men. I remember once when the green was pretty full, and a handicap medal was being played for, that, at the close of the first round, he cautioned a young fellow who was slightly known to him in terms something like these: 'If you require a handicap of a *half-one* you will not find it to your advantage to drink to its health and prosperity in its *namesake* every few holes. You will drink rather to its confusion, sir!'

The best of players for the most part unconsciously *press* now and then. I never saw Dr —, however, other than most deliberate in his own game. It was nothing extraordinary that I should, in these days at least, put more effort than was wise into my swing; none the less there came to me these words: 'Keep *game* in your *press* for luncheon, if you like, but don't for any sake *press* in your game; keep everything in its place!'

When he went with me to choose my clubs, he looked on smilingly as I swung them to and fro. I saw his thought in his eyes before he had given it to his lips: 'One feels himself such a rare hand in the shop—does he not?' And then, as I, like a beginner, made a short leet of the supplest of the drivers, he said more coldly, as though his thought deepened towards the close of the sentence, light as the words seemed: 'Don't take these just yet; if your club has too much *spring* in it, you will find "the *winter*" of your "discontent"—when it snaps!'

It has been my intention only to speak of this fond old enthusiast in connection with the royal and ancient game. At home there was the same facility in his play upon words; even in our more serious conversations, which were punctuated by sips from the social (but single) tumbler, or whiffs from the soothing weed, the inveterate habit betrayed itself of re-stating things—that is, placing his words in one order and then in another, with sometimes startling ingenuity. It was an exercise, indeed, that was never engaged in to no purpose; never so that the changes ministered to mere *non-sense*; they always brought an added sense, rather, and in-

terest. It is not too much to say that as a rule they fulfilled Hood's exacting conditions, short of which the common pun becomes a contemptible creature, which ought to find itself in the ranks of that large visible and invisible assembly, 'the unemployed.'

There's a double chuck at a double chin,
And, of course, there's a double pleasure therein,
If the parties were brought to telling :
And however our Dennises take offence,
A double meaning shows double sense ;
And if proverbs tell truth,
A double tooth
Is Wisdom's adopted dwelling !

In fact, the habit was a craze with Dr —, as was his daily round of the green. Time had not staled his infinite variety in word-play. My memory, however, has run down. He was at least himself ; and his odd little speeches, whether on the links or indoors, had certainly never entered the atmosphere through other lips. He never thought anything he said was worth deliberately putting down—although in *very* early youth it is true he published a pamphlet on Anesthesia—and it may be you, my reader, agree with him in this. Ah, well ! as I recall the tones, the gestures, and think of the kind soul himself as I knew him, the conclusion comes to me that these remembrances must be to the writer very different from what they appear to you. The bloom of the personality is upon them all, in my vision, and they hang free and full. To you—and I blame you not—they are dry, it may be, and stiff in arrangement—redolent of the box they are packed in, rather than the honeyed sunshine in which they swung to and fro—and so, 'Here endeth the second lesson.'

The lettering on his simple epitaph is losing its sharpness. He died in extreme old age. Day by day, when reaching the big links was beyond his power, he played a short game with his putter over a small green behind his house ; and I am told—for I was then at a distance, and had seen my last of him, indeed—when he could no longer go out of doors at all, that the noble game of billiards was discarded and dethroned, and that his green table was fondled by the old man's fancy into a mimic golf-course, which by-and-by in its turn became too tedious for him. Now he lies at rest, and the primroses and violets bloom as of old, but, alas ! not for him.

THIS MORTAL COIL.

CHAPTER XXIII.—UNDER THE PALM-TREES.

A LONE governess, even though she be a Girton girl, vanishes readily into space from the stage of society. It's wonderful how very little she's missed. She comes and goes and disappears into vacancy, almost as the cook and the housemaid do in our modern domestic phantasmagoria ; and after a few months, everybody ceases even to inquire what has become of her. Our round horizon knows her no more. If ever at rare intervals she happens to flit for a moment across our zenith again, it is but as a *revenant* from some distant sphere. She has played her part in life, so far as we are concerned, when she has 'finished

the education' of our growing girls, as we cheerfully phrase it—what a happy idea that anybody's education could ever be finished !—and we let her drop out altogether from our scheme of things accordingly, or feel her, when she invades our orbit once more, as inconvenient as all other *revenants* proverbially find themselves. Hence, it was no great wonder indeed that Elsie Challoner should subside quietly into the peaceful routine of her new existence at the Villa Rossa at San Remo, with 'no questions asked,' as the advertisements frankly and ingenuously word it. She had a few girl-friends in England—old Girton companions—who tracked her still on her path through the cosmos, and to these she wrote unreservedly as to her present whereabouts. She didn't enter into details, of course, about the particular way she came to leave her last temporary home at the Meyseys' at Whitestrands : no one is bound to speak out everything ; but she said in plain and simple language she had accepted a new and she hoped more permanent engagement on the Riviera. That was all. She concealed nothing and added nothing. Her mild deception was purely negative. She had no wish to hide the fact of her being alive from anybody on earth but Hugh and Winifred ; and even from them she desired to hide it by passive rather than by active concealment.

But it is an error of youth to underestimate in the long-run the interosculcation of society in our modern Babylon. You may lurk and languish and lie obscure for a while ; but you do not permanently evade anybody : you may suffer eclipse, but you cannot be extinguished. While we are young and foolish, we often think to ourselves, on some change in our environment, that Jones or Brown has now dropped entirely out of our private little universe—that we may safely count upon never again happening upon him or hearing of him anyhow or anywhere. We tell Smith something we know or suspect about Miss Robinson, under the profound but, alas, too innocent conviction that they two revolve in totally different planes of life, and can never conceivably collide against one another. We leave Mauritius or Eagle City, Nebraska, and imagine we are quit for good and all of the insignificant Mauritians or the free-born, free-mannered, and free-spoken citizens of that far western mining camp. Error, error, sheer juvenile error ! As comets come back in time from the abysses of space, so everybody always turns up everywhere. Jones and Brown run up against us incontinently on the King's Road at Brighton ; or occupy the next table to our own at Delmonico's ; or clap us on the shoulder as we sit with a blanket wrapped round our shivering forms, intent upon the too wintry sunrise on the summit of the Rigi. Miss Robinson's plane bisects Smith's horizon at right angles in a *dahabeejah* on the Upper Nile, or discovers our treachery at an hotel at Orotava in the Canary Islands. Our Mauritian sugar-planter calls us over the coals for our pernicious views on differential duties and the French bounty system, among the stormy channels of the Outer Hebrides ; and Colonel Bill Manningham, of the *Eagle City National Banner*, intrudes upon the quiet of our suburban villa at remote Surbiton to inquire, with Western American picturesqueness and exuberance of vocabulary, what the Hades we meant by

our casual description of Nebraskan society as a den of thieves, in the last number of the *St Petersburg Monitor*? O no; in the pre-Columbian days of Boadicea, and Romulus and Remus, and the Twenty-first Dynasty, it might perhaps have been possible to mention a fact at Nineveh or Peking with tolerable security against its being repeated forthwith in the palaces of Mexico or the huts of Honolulu; but in our existing world of railways and telegraphs and penny postage, and the great ubiquitous special correspondent, when Morse and Wheatstone have wreaked their worst, and whosoever enters Jerusalem by the Jaffa Gate sees a red-lettered notice-board staring him in the face, 'This way to Cook's Excursion Office'—the attempt to conceal or hush up anything has become simply and purely a ridiculous fallacy. When we go to Timbuctoo, we expect to meet with some of our wife's relations in confidential quarters; and we are not surprised when the aged chief who entertains us in Parisian full dress at an eight o'clock dinner in the Fiji Islands relates to us some pleasing Oxford anecdotes of the missionary bishop whom in unregenerate days he assisted to eat, and under whom we ourselves read Aristotle and Tacitus as undergraduates at dear sleepy old Oriel. More than ever nowadays is the proverb true, 'Quod tacitum velis nemini dixeris.'

It was ordained, therefore, in the nature of things, that sooner or later Hugh Massinger must find out Elsie Challoner was really living. No star shoots ever beyond the limits of our galaxy. But the discovery might be postponed for an indefinite period; and besides, so far as Elsie herself was concerned, her only wish was to keep the fact secret from Hugh in person, not from the rest of the world at large; for she knew everybody else in her little sphere believed her merely to have left the Meyseys' in a most particular and unexplained hurry. Now, Hugh for his part, even if any vague rumour of her having been sighted here or there in some distant nook of the Riviera by So-and-so or What's-his-name might happen at any time to reach his ear, would certainly set it down in his own heart as one more proof of the signal success of his own clever and cunningly designed deception. As a matter of fact, more than one person did accidentally, in the course of conversation, during the next few years mention to Hugh that somebody had said Miss Challoner had been seen at Marseilles or Cannes or Genoa or somewhere; and Hugh in every case did really look upon it only as another instance of Warren Relf's blind acceptance of his bland little fictions. The more people thought Elsie was alive, the more did Hugh Massinger in his own heart pride himself inwardly on the cleverness and far-sightedness of the plot he had laid and carried out that awful evening at the *Fisherman's Rest* at Whitestrand in Suffolk.

Thus it happened that Elsie was not far wrong, for the present at least, in her calculation of chances as to Hugh and Winifred.

The very day Elsie reached San Remo, news of Mr Meysey's death came to her in the papers. It was a sudden shock, and the temptation to write to Winifred then was very strong; but Elsie resisted it. She had to resist it—to crush down her sympathy for sympathy's sake. She couldn't bear to break poor Winifred's heart

at such a moment by letting her know to the full all Hugh's baseness. It was hard indeed that Winifred should think her unfeeling, should call her ungrateful, should suppose her forgetful; but she bore even that—for Winifred's sake—without murmuring. Some day, perhaps, Winifred would know; but she hoped not. For Winifred's sake, she hoped Winifred would never find out what manner of man she proposed to marry.

And for Hugh's too. For with feminine consistency and steadfastness of feeling, Elsie even now could not learn to hate him. Nay, rather, though she recognised how vile and despicable a thing he was, how poor in spirit, how unworthy of her love, she loved him still—she could not help loving him. For Hugh's sake, she wished it all kept secret for ever from Winifred, even though she herself must be the victim and the scapegoat. Winifred would think harshly of *her* in any case: why let her think harshly of Hugh also?

And so, in the little Villa Rossa at San Remo, among that calm reposeful scenery of olive groves and lemon orchards, Elsie's poor wounded heart began gradually to film over a little with external healing. She had the blessed deadening influence of daily routine to keep her from brooding: those six pleasant, delicate, sensitive, sympathetic consumptive girls to teach and look after and walk out with perpetually. They were bright young girls, as often happens with their type; extremely like Winifred herself in manner—too like, Elsie sometimes thought in her own heart with a sigh of presentiment. And Elsie's heart was still young, too. They clambered together, like girls as they were, among the steep hills that stretch behind the town; they explored that pretty coquettish country; they wandered along the beautiful olive-clad shore; they made delightful excursions to the quaint old villages on the mountain sides—Taggia and Ceriana and San Romolo and Perinaldo—mouldering gray houses perched upon pinnacles of mouldering gray rock, and pierced by arcades of Moorish gloom and medieval solemnity. All alike helped Elsie to beat down the memory of her grief, or to hold it at bay in her poor tortured bosom. That she would ever be happy again was more than in her most sanguine moments she dared to expect; but she was not without hope that she might in time grow at least insensible.

One morning in December, at the Villa Rossa, about the hour for early breakfast, Elsie heard a light knock at her door. It was not the cook with the *café-au-lait* and roll and tiny pat of butter on the neat small tray for the first breakfast: Elsie knew that much by the lightness of the knock. 'Come in,' she said; and the door opened and Edie entered. She held a letter in her right hand, and a very grave look sat upon her usually merry face. 'Somebody dead?' Elsie thought with a start. But no; the letter was not black-bordered. Edie opened it and drew from it slowly a small piece of paper, an advertisement from the *Times*. Then Elsie's breath came and went hard. She knew now what the letter portended. Not a death: not a death—but a marriage!

'Give it me, dear,' she cried aloud to Edie. 'Let me see it at once. I can bear it—I can bear it.'

Eddie handed the cutting to her, with a kiss on her forehead, and sat with her arm round Elsie's waist as the poor dazed girl, half erect in the bed, sat up and read that final seal of Hugh's cruel betrayal: 'On Dec. 17th, at Whitestrand parish Church, Suffolk, by the Rev. Percy W. Bickersteth, M.A., cousin of the bride, assisted by the Rev. J. Walpole, vicar, HUGH EDWARD DE CARTERET MASSINGER, of the Inner Temple, Barrister-at-law, to WINIFRED MARY, only daughter of the late Thomas Wyville Meysey of Whitestrand Hall, J.P.'

Elsie gazed at the cutting long and sadly; then she murmured at last in a pained voice: 'And he thought I was dead! He thought he had killed me!'

Elsie's fiery indignation could restrain itself no longer. 'He's a wicked man,' she cried: 'a wicked, bad, horrible creature; and I don't care what you say, Elsie; I hope he'll be punished as he well deserves for his cruelty and wickedness to you, darling.'

'I hope not—I pray not,' Elsie answered solemnly. And as she said it, she meant it. She prayed for it profoundly.

After a while, she set down the paper on the table by her bedside, and laying her head on Eddie's shoulder, burst into tears—a torrent of relief for her burdened feelings. Eddie soothed her and wept with her, tenderly. For half an hour Elsie cried in silence; then she rose at last, dried her eyes, burnt the little slip of paper from the *Times* resolutely, and said to Eddie: 'Now it's all over.'

'All over?' Eddie echoed in an inquiring voice.

'Yes, darling, all over,' Elsie answered very firmly. 'I shall never, never cry any more at all about him. He's Winifred's now, and I hope he'll be good to her.—But, oh, Eddie, I *did* once love him so!'

And the winter wore away slowly at San Remo. Elsie had crushed down her love firmly in her heart now—crushed it down and stifled it to some real purpose. She knew Hugh for just what he was: she recognised his coldness, his cruelty, his little care for her; and she saw no sign—as how should she see it?—of the deadly remorse that gnawed from time to time at his tortured bosom. The winter wore away, and Elsie was glad of it. Time was making her regret less poignant.

Early in February, Eddie came up to her room one afternoon, when the six consumptive pupils were at work in the schoolroom below with the old Italian music-master, under Mrs Relf's direction, and seating herself, girl-fashion, on the bed, began to talk about her brother Warren.

Elsie seldom talked of Warren to Elsie: she had even ostentatiously avoided the subject hitherto, for reasons of her own which will be instantly obvious to the meanest intelligence. But now, by a sort of accident of design, she mentioned casually something about how he had always taken them, most years, for so many nice trips in his yawl to the lovely places on the coast about Bordighera and Mentone, and even Monte Carlo.

'Then he sometimes comes to the Riviera with you, does he?' Elsie asked listlessly. She loved Eddie and dear old Mrs Relf, and she was grateful to Warren for his chivalrous kindness; but she could hardly pretend to feel profoundly interested

in him. There had never been more than one man in the world for her, and that man was now Winifred's husband.

'He always comes,' Eddie answered, with a significant stress on the word *always*. 'Indeed, this is the very first year he's ever missed coming since we first wintered here. He likes to be near us while we're on the coast. It gives him a chance of varying his subjects. He says himself, he's always inclined to judge of genius by its power of breaking out in a fresh place—not always repeating its own successes. In summer he sketches round the mouth of the Thames and the North Sea, but in winter he always alters the venue to the Mediterranean. Variety's good for a painter, he thinks: though, to be sure, that doesn't really matter very much to *him*, because nobody ever by any chance buys his pictures.'

'Can't he sell them, then?' Elsie asked more curiously.

'My dear, Warren's a born artist, not a picture-dealer; therefore, of course, he never sells anything. If he were a mere dauber, now, there might be some chance for him. Being a real painter, he paints, naturally enough, but he makes no money.'

'But the real painter always succeeds in the end, doesn't he?'

'In the end, yes; I don't doubt that: within a century or two. But what's the good of succeeding, pray, a hundred years after you're dead and buried? The bankers won't discount a posthumous celebrity for you. I should like to succeed while I was alive to enjoy it. I'd rather have a modest competence in the nineteenth century than the principal niche in the Temple of Fame in the middle of the twentieth. Besides, Warren doesn't want to succeed at all, dear boy—at least, not much. I wish to goodness he did. He only wants to paint really great pictures.'

'That's the same thing isn't it?—or very nearly.'

'Not a bit of it. Quite the contrary in some cases. Warren's one of them. He'll never succeed while he lives, poor child, unless his amiable sister succeeds in making him. And that's just what I mean to do in time, too, dear.—I mean to make Warren earn enough to keep himself—and a wife and family.'

Elsie looked down at the carpet uneasily. It wanted darning. 'Why didn't he come this winter as usual?' she asked in haste, to turn the current of the conversation.

'Why? Well, why? What a question to ask!—Just because *you* were here, Elsie.'

Elsie examined the holes in the Persian pattern on the floor by her side with minuter care and precision than ever. 'That was very kind of him,' she said after a pause, defining one of them with the point of her shoe accurately.

'Too kind,' Eddie echoed—'too kind, and too sensitive.'

'I think not,' Elsie murmured low. She was blushing visibly, and the carpet was engrossing all her attention.

'And I think *yes*,' Eddie answered in a decisive tone. 'And when I think yes, other people ought as a matter of course to agree with me. There's such a thing as being too generous, too delicate, too considerate, too thoughtful for others. You've no right to swamp your own individuality. And

I say, Warren ought to have brought the yawl round to San Remo long ago, to give us all a little diversion, and not gone skulking like a pickpocket about Nice and Golfe Jouan, and Toulon and St Tropez, for a couple of months together at a stretch, without so much as ever even running over here to see his own mother and sister in their winter-quarters. It's not respectful to his own relations.'

Elsie started. 'Do you mean to say,' she cried, 'he's been as near as Nice without coming to see you?'

Edie nodded. 'Ever since Christmas.'

'No! Not really?'

'Yes, my child. Really, or I wouldn't say so. It's a practice of mine to tell the truth and shame a certain individual. Warren couldn't stop away from us any longer; so he took the yawl round by Gibraltar after—the 17th of December, you know.'—Elsie smiled sadly.—'And he's been knocking about along the coast round here ever since, afraid to come on—for fear of hurting your feelings, Elsie.'

Elsie rose and clasped her hands tight. 'It was very kind of him,' she said. 'He's a dear good fellow.—I think I could bear to meet him now. And in any case, I think he ought at least to come over and see you and your mother. It would be very selfish of me, very wrong of me to keep you all out of so much pleasure.—Ask him to come, Edie.—Tell him—it would not hurt me very much to see him.'

Edie's eyes flashed mischievous fire. 'That's a pretty sort of message to send any one,' she cried, with some slight amusement. 'We usually put it in a politer form. May I vary it a little and tell him, Elsie, it will give you great pleasure to see him?'

'If you like,' Elsie answered, quite simply and candidly. He was a nice fellow, and he was Edie's brother. She must grow accustomed to meeting him somehow. No man was anything at all to her now.—And perhaps by this time he had quite forgotten his foolish fancy.

The celebrated centreboard yawl *Mud-Turtle*, of the port of London, Relf, master, seventeen tons registered burden, was at that moment lying up snugly by a wooden pier in the quaint little French harbour of St Tropez, just beyond the blue peaks of the frontier mountains. When Potts next morning early brought a letter on board, addressed to the skipper, with an Italian stamp duly stuck in the corner, Warren Relf opened it hastily with doubtful expectations. Its contents made his honest brown cheek burn bright red. 'My dear old Warren,' the communication ran shortly, 'you may bring the yawl round here to San Remo as soon as you like. She says you may come; and what's more, She authorises me to inform you in the politest terms that it will give her very great pleasure indeed to see you. So you can easily imagine the pride and delight with which I am ever, Your affectionate and successful sister,

EDIE.'

'Edie's a brick!' Warren said to himself with a bound of his heart; 'and it's really awfully kind of—Elsie.'

Before ten o'clock that same morning, the celebrated centreboard yawl *Mud-Turtle*, manned by her owner and his constant companion, was under

way with a favouring wind, and scudding like a seabird, with all canvas on, round the spit of Bordighera, on her voyage to the tiny harbour of San Remo.

(To be continued.)

TWO CITIES OF THE FAR WEST.

VANCOUVER AND VICTORIA.

THE great railway that now spans the broad expanse of Canada from ocean to ocean has opened to us large tracts of hitherto little-known country on the Pacific seaboard. Until lately, British Columbia and the North-west territories beyond Winnipeg suggested to our thoughts a remote and mysterious land, a Great Unknown, a British Siberia, visited but by a few bold adventurers. The new railway has changed this state of affairs. The inquiring tourist may now take his ticket at Montreal, skim across the prairies and over the Rocky Mountains in the cushioned comfort of a Pullman car, and in a few days emerge unruffled on the western coast-line, and tranquilly gaze on the blue water of the Pacific Ocean.

The prospects of a terminal port in this new country naturally appear brilliant. To collect the rich merchandise of the Orient, the various products of the Pacific coast and islands, and the developing commerce of Western Canada, and to pour them, so to speak, through the funnel of such a port into Eastern markets by the great railway—such a destiny gives rise to dreams of a future mighty metropolis, a Liverpool of the Pacific, a commercial Eldorado of the West.

Two cities—all embryo towns in those parts are 'cities'—are now bitterly contending for this honour: Vancouver, on the mainland, at the terminus of the railway; and Victoria, the present capital of British Columbia, on Vancouver Island, opposite. And which will gain the victory in the struggle eventually, it is at present hard to say. Each brings forward excellent arguments in its own favour, and scornfully reviles the pretensions of its rival. To the unbiased observer, Vancouver has undoubtedly strong reasons in its favour. It stands on a magnificent site, worthy of a great city, lying between two splendid harbours. The inner one is entirely land-locked, approached by a narrow but quite sufficient entrance, and protected by hills all round. It runs, a broad inlet of the sea, up to Port Moody, some ten miles above Vancouver on the railway line. The anchorage, now called Coal Harbour, is good and capacious, and close to the terminus of the railway. The town stands on a gently rising hill, and, outside, is washed by the waters of English Bay, which offers an anchorage to vessels of all sizes. A branch-line brings this harbour also into connection with the railway. A narrow sheet of water, shallow and suitable only for boats, runs from this bay into the heart of the future town.

At present, Vancouver is very young, and presents the appearance accordingly of a very young town. The surface of the hill which is to be its site is cleared from the dense pine forest that covered it, and is black with the charred remains of tree-stumps. New buildings, chiefly of wood, are rapidly growing up here and there; and down

by the water's edge of the inner harbour a very respectable nucleus of the future 'great city' is already formed. The streets, ambitiously broad and imposing, are marked out, and in parts already well made, wooden side-walks skirting their edges. In American style, they cut each other at right angles at regular intervals, forming squares, whereon 'blocks' are to rise. The houses have so far naturally failed to keep pace with these ambitious proceedings, and rise in scattered irregularity, sometimes in sociable groups, sometimes in rather ludicrous solitude—desolate occupants of otherwise empty blocks. Amid these spick-and-span erections, rears up an occasional tree-stump, huge and melancholy, an aged parent of the forest mourning his children, whom he fails to recognise in their new guise, as, neatly sliced up into planks by the sawmill near, they rise around the charred patriarch in the shape of 'desirable residences,' brilliant with paint and the ornate decorations of the modern architect's evolution. Some of these tree-stumps are enormous: twenty or thirty feet in girth.

At present, Vancouver contains few places of either business or recreation. Two varieties of commerce, however, exist in profusion: ginsalaces or 'saloons,' and 'real estate agencies.' How the former manage to flourish in such abundance it is not easy to say, for there must be at least one to every hundred of the population; and allowing for women, children, and teetotalers—the last, it is to be feared, rare—the number of customers to each must be small. The 'real estate agencies' offer land for sale in lots, and, bearing in mind the great future predicted for the town, it is hardly necessary to say that their prices are extravagantly high. Like the saloons, it is hard to surmise who are the victims of their blandishments. Possibly they maintain a business between themselves, and thus mutually support each other. No doubt, however, good bargains have been made in land by astute men of business buying in good time and 'holding on,' for the price of land has risen enormously. It is now so high as to be beyond a joke, and threatens temporary commercial paralysis. It must come down again, to allow settlers to commence business; and, the city once established, it will then naturally rise again. Large portions of Vancouver belong to the Canadian Pacific Railway Company, who are accused of favouring that city with a view to getting rid of their land advantageously.

In four or five hours a steamer from Vancouver reaches Victoria, the chief port of Vancouver Island. The trip across in fine weather is an interesting one. The passage is threaded through a number of very beautiful islands, rocky and wooded, that stud the calm waters of the straits; and beyond them, on the mainland, snow-clad mountains rise above the fir forests in distant magnificence. Arrived off Victoria, a comparison of that harbour with Vancouver is certainly unfavourable to the former. It is small and shallow, allowing only vessels of light draught to enter, although there is an outer anchorage and wharf suited to the requirements of larger steamers. The Victorians, however, intend dredging and improving their harbour, which will increase their chances of future success. Victoria itself is a city of already established importance,

and is the seat of the provincial government. It has a population of about fifteen thousand, including some four thousand Chinese, and covers two or three square miles, if the straggling suburbs be taken into account. The streets, arranged in the usual manner of parallels enclosing blocks, are not particularly fine in appearance. There are few buildings of notable architectural beauty, the majority of the houses being of wood, and not more than one story in height. There are plenty of good shops, however; telephones spread their web of wires, and the electric light illumines the town by night. There are good hotels, to one of which is attached the Victoria Theatre, a pretty and well-appointed little house, frequently visited by good travelling companies from the States. Several daily newspapers are published, which are enterprising enough in the supply of news, but essentially American in style, and lacking in dignity of tone.

Society in Victoria is neither English, Canadian, nor American, but perhaps a mixture, or rather stratification, of the three. The 'upper circles' are decidedly English in character, a quality that they are proud to maintain. A large number of these, the more prominent citizens, have their houses in 'James' Bay,' a paradoxical term of geography applied generally to a promontory lying between the harbour and the outer coastline. Here are a number of handsome houses, standing in gardens, which are in summer brilliant with flowers. Here also is Beacon Hill, a park-like piece of land, forming a favourite summer resort. Looking seaward from this hill, the view on a clear day is magnificent, the snow-capped Olympian range rising into the clouds, on the American coast, in stately splendour.

The middle and lower classes of society are more Canadian and American in character. Indeed, those here termed the 'lower' classes would probably resent that title, for they are distinguished by a great independence of manner, assuming 'one man to be as good as another.' In the shops, the obsequious politeness of the English tradesman is unknown; buyer and seller treat as equals, with offhand matter-of-fact dryness. The street loafer is hail-fellow-well-met with men of all degrees who may chance to address him. This independence extends to the boys in the streets; a request to one of these young gentlemen to hold a horse or carry a bag with a view to ultimate payment would probably be rejected with scorn, though as a gratuitous favour it might be done.

American colloquialisms are common: a house is not 'in,' but 'on,' a street; shops are called 'stores' (a chemist's being a 'drug-store,' a haberdasher's a 'dry-goods store'); sweetmeats are 'candies'; biscuits, 'crackers'; and perambulators (shade of Johnson!), 'push-buggies.'

In business matters, Victoria seems curiously apathetic and lacking in enterprise; unlike many modern Western cities, so remarkable for their energy and rapidity of growth. But the competition with Vancouver has lately awakened Victorians to the importance of maintaining their commercial interests, and less lethargy is likely to be now displayed. The apathy in commercial affairs extends in some degree to political and religious matters, neither of which is in the wholesome and harmonious condition necessary to social prosperity.

The hopes of Victoria are largely founded on the fine harbour of Esquimalt, four miles distant, now the headquarters of our Pacific naval squadron. This harbour, just inside the Strait of Juan de Fuca, is easy of access by day and night; an advantage not to be claimed by Vancouver, which must be reached through island-studded channels, strong tideways, and frequent fogs. Esquimalt harbour is land-locked, safe, and roomy, and, being directly connected with the coal-mines of Nanaimo by a railway, which is now being carried on into Victoria, its advantages to steamers are obvious. It is the high ambition of Victoria to connect this railway with the Canadian Pacific on the mainland, and so make a terminal port of Esquimalt. Could this be accomplished, the pretensions of Vancouver would be shattered. But the engineering difficulties in the way threaten great expense, and it is to be feared that this scheme will not be carried out, at any rate for some time to come. Another advantage offered by Esquimalt is its fine dry dock, lately finished, and opened by Her Majesty's ship *Cormorant* in July last.

These harbour, coaling, and dock accommodations would be strong inducements to any line of steamers that might contemplate the China-Canadian or Australo-Canadian routes, provided the delays and difficulties of transshipment to the mainland could be got over. The country all round Victoria, and especially the harbour of Esquimalt, is very beautiful. In summer, its many rocky inlets from the sea and wooded banks conceal mossy spots suggestive of fairyland, and the calm blue water offers irresistible temptations to those who love boating and fishing. Among the pine-woods, flowers and ferns abound in a profusion gladdening to the lover of nature, whether on science or on pleasure bent.

The climate of these parts is peculiar in the extremes of heat and cold it sometimes exhibits; and it has been described, with more force than absolute truth, by Père Accolti, an early Jesuit missionary, as 'huit mois d'hiver et quatre d'enfers.' It is, however, not so bad as this; the winter is damp and unpleasant, but the summer months are delightful. Altogether, the climate in general resembles that of the south-west of England, though a good deal colder in winter.

MISS BARKLE'S LEGACY.

CONCLUSION.—LOST AND WON.

Two months had elapsed since the events detailed in our last chapter, and no change in Miss Barkle's circumstances was yet apparent to Midport society. She was still residing at the cottage, and Annie Carston was with her. There was nothing to show that the increased income she anticipated existed anywhere but in her own imagination, for she lived as quietly and unostentatiously as she did before that wonderful advertisement appeared. It had leaked out, as such things always do, that Mrs Penbury was the widow of the man who was said to have left Miss Barkle money; but question as they would, not a shred of information could the gossips get from any of the four people who might be expected to know the ins and outs of the matter. John Brawn said bluntly he knew nothing about it; and

Annie Carston took her cue from him. Miss Barkle displayed symptoms of hysteria if the subject was mentioned; and the clergyman's wife, who had rashly attempted to sound Mrs Penbury under cover of a visit of condolence, was seen fleeing from Lansdale House back to the rectory in a fit of nervous apprehension, which she did not get over for days. It was extremely provoking and unsatisfactory; so, for want of new particulars, people began to grow sceptical, and to shake their heads doubtfully when Miss Barkle's legacy was touched upon.

Perhaps there was some ground for curiosity. The residents at Lansdale House and the cottage seemed to be on the best of terms. That John Brawn was engaged to Annie Carston was well known long ago, and the fact had given rise to many a sly laugh at Miss Barkle's expense. It was quite in the order of things that they should be much together either at one house or the other, but their engagement did not account for the frequency of Mrs Penbury's visits to the cottage. That was the stumbling-block which no one could explain away, and which forced the old ladies of Midport to insist that there was no money question at all to solve. Had the widow gone nowhere, it would of course have excited no remark; but her selection of Miss Barkle as her only friend under such circumstances could not escape notice. A few enthusiasts had made a point of calling at the cottage when Mrs Penbury was known to be there, but this manoeuvre had so far resulted in conspicuous failure. The announcement of a visitor was almost instantly followed by the widow's departure, and a seemingly cordial 'Good-bye' was all that any one had ever heard pass between the two ladies.

Society is apt to avoid people and things it 'doesn't quite understand,' especially when its investigations are discouraged; so it gradually came about that our heroine saw her friends insensibly drifting away, back to the old distance at which she had known them before. Having been set up as the centre of interest for a time, she felt their defection sorely, realising that it was only eagerness to see the golden nimbus she wore that brought them so closely round her. Now that attraction was fading from their sight, and she stood upon her own merits, she was left alone again; almost alone, but one friend at least remained staunch to her, and she valued him accordingly. Captain Mulbane was the friend. He knew no more about the condition of her affairs than any one else, and had flatly refused to exert what influence he possessed to discover anything about them. 'And if the lady *did* honour me with her confidence on such private matters, Mr M'Gorgle, I should keep it to myself—to myself, sir!' Thus the captain had answered a chum, to the astonishment of a circle of friends at the club; and as this indicates a complete change of tactics on the part of that gentleman, we hasten to explain it to the reader. Captain Mulbane had turned over a new leaf, and renounced his habit of collecting and retailing scraps of local news for the edification of his acquaintances. He had received a letter from Annie Carston the day after he saw her at the gate of the cottage, in which she begged him to maintain silence regarding that little incident on the beach, painting in high colours Miss Barkle's dread of its becoming

known. It had shamed him to feel that his reputation was such as to make any one think it necessary to write to him thus; and being a man of impulse, he made his resolution on the spot. When, therefore, the inquiring M'Gorgle, egged on by more cautious friends, asked him 'to find out what was really on the cards' at the cottage, the captain arose and crushed him with the high-toned strength of his newly acquired principle.

No doubt his feeling for Miss Barkle did much towards his reformation; but whatever the motive may have been, he practised the virtue of silence faithfully, until Midport ceased to regard him as its chief purveyor of useless knowledge. John Brawen's engagement had given him profound satisfaction: it cleared the way for him to approach Miss Barkle; and he had never wavered in his determination to ask for her hand as soon as he saw a prospect of doing so with success. Her manner when she told him 'time would show' that day on the beach made him doubt the advisability of renewing his advances just now. If she had really been fond of Brawen, it was hardly likely so soon after his betrothal to somebody else that she would be disposed to look favourably upon another suitor. He had proceeded so far with commendable judgment for one whose experience in love was so small. Their first encounter after that memorable day on the beach had been a little timid on both sides; but Miss Barkle soon discovered that he had kept his promise not to mention it, and they felt that their secret created something of a mutual confidence, which to the captain was gratifying in the extreme. The rumours about her money had given him a little uneasiness, but in no way affected his attitude towards her; and his frequent visits were characterised by all the old pleasant intimacy, with a faint suggestion of deeper purpose behind. In truth, Captain Mulbane felt guilty in her presence; he had been choked off on the very verge of a proposal, and the course of events since had impelled him for his own sake to keep back words which he knew she had a right to expect from him, whether she was prepared to accept him or not. He must bide his time if he meant to give himself a fair chance. He could afford to wait, now that his only possible rival was out of the field, and—this was really an afterthought—something might turn up meantime about that mysterious money affair of hers.

For her part, Miss Barkle was not a little puzzled by his behaviour. She had quite forgotten the chance remark with which she had fired his jealousy; but his bearing as he uttered that tremulous 'Lina,' and the catastrophe that followed, were fresh in her recollection. He had always been attentive to her, and was even more so now; whilst she, true to her resolve, had treated him in her sweetest manner. She could not understand why he had never taken up the thread of that half-made offer. Two months had passed and he had not spoken, and no blandishments seemed to encourage him. She felt there was something which deterred him, but could not divine what it could be. That he suspected the feelings she had entertained for John Brawen, never entered her thoughts, and she sadly wondered if her love was destined to kill that of any man who succeeded in awakening it.

Before going further with the story of Miss Barkle's love affair, it is necessary to take the reader back six weeks and explain how the reconciliation of Mrs Penbury with that lady was brought about. Annie Carston had been the moving spirit in effecting it; and by the exercise of considerable patience and tact, she at length attained her object. Much of the widow's bitterness was due to the apparent haste with which the legatee had attempted to gain possession of the money, laying undue stress on the personal visit she had paid to Messrs Lambton and Warder. She had pointed this out one evening to Annie, deducing therefrom that Miss Barkle must by nature be a heartless grasping woman.

'I'm sure you wouldn't call her grasping, if you knew her,' said Annie; 'and as for being heartless, she was awfully fond of Jack.'

Mrs Penbury smiled. Miss Barkle's affection for her brother might certainly be counted a small point in her favour, since it had not been returned; but Miss Carston's arguments were hardly convincing to her mind.

'It's a pity you went up to town that time, Lina,' said Annie to her friend the same evening; 'that seems to have hurt Mrs Penbury as much as anything else.'

'I don't see how it could offend her,' said Miss Barkle wearily. Her troubles had weighed upon her heavily of late, and she was casting about for means to rid herself of them at any cost.

'She thinks you were in a hurry to get the money, and didn't consider how she was placed.'

'I didn't know there was a Mrs Penbury till the lawyer told me.'

'Of course I know that; but you see she is unreasonable about the whole thing,' said Annie, rather unfairly.

'I'm sure I would gladly be friends with her, if it's only for your sake,' replied Miss Barkle. She honestly desired to be on good terms with the widow because she was John Brawen's sister, if for no other reason, and had latterly been considering whether the adoption of heroic measures might not restore the peace of mind she had lost.

Her gratification at hearing of Mr Penbury's bequest had been due more largely than she herself suspected to the influence it might have had on John Brawen, and she began to realise this after his engagement to Annie Carston was declared. Her improved prospects, now there was no hope of sharing them with him, looked far less pleasing to her than they had done at the time there was apparently ground for her expectations. She drew a parallel between Mrs Penbury's case and her own: the widow had believed herself to be the one woman in her husband's world; and she, Miss Barkle, had innocently crushed that belief in the saddest hour of a woman's life. Miss Barkle had fondly nursed the thought that she was all in all to John Brawen; and Annie Carston, also guiltless, had robbed her of her love. Now, the last flicker of hope had died away, and she felt the legacy, so hateful to his sister, must be to some extent distasteful to him. She would therefore relinquish her claim to it; it had lost its value to her: to renounce it would prevent the total alienation of John Brawen from herself, and she

could plod along quietly at the cottage, as she had done for so many years. That her plan was quixotic, is the best that can be said for it, but we must bear in mind that Miss Barkle conceived it at a time when she felt she had nothing left on earth to live for. Mrs Penbury should acquit her of over-anxiety to obtain her husband's money; she had at least not deserved that imputation.

So Miss Barkle set to work and indited two letters—one to John Brawen, extremely business-like and short; and the other to Mrs Penbury, meek almost to servility. To Brawen she simply notified her wish to waive any claim she held against the late Mr Penbury's estate, requesting him to make it known in the proper quarter. We need not go deeply into the contents of the other letter; we have more to do with the result it produced.

'Miss Barkle has written to me to say she doesn't want the money,' said Mrs Penbury to Annie one evening soon after their last conversation.

Miss Carston stared with surprise. 'Not want the money, when it would double her income at least!' She had never said a word about this to her.—'What does she say?' asked Annie.

'Says she has had experiences lately which have led her to appreciate the feelings with which I must regard her,' said Mrs Penbury, reading from the letter; 'and begs that I will allow the lawyers to ignore her claim entirely, as she has asked Mr Brawen to have it withdrawn.'

'I wonder what she means?' said Annie, a faint suspicion that she had something to do with it crossing her mind. 'But will you let her give it up?'

'I don't believe for a moment the woman's in earnest,' said the widow in a hard voice.

'Perhaps, if you took her at her word, and then made friends with her, you would see if she really meant to resign it.' She was going to add, 'And then give it back afterwards,' but thought she might leave that to Mrs Penbury's sense of justice.

The widow sat silent for a few minutes, drumming with the letter on her lips, and finally decided to act upon Annie's proposition. She would assume that Miss Barkle actually meant to abandon her rights. It would be very convenient for herself if she did so, for she could then withdraw opposition to the probate of her husband's will. Of course, Miss Barkle should have her money eventually; but it was one thing to have it remorselessly kept back and paid away, and another to make a voluntary gift of it, as she could do if she took Miss Barkle at her word. We always feel a certain kindness for any one to whom we have done a favour; and Mrs Penbury felt that if the ten thousand pounds were placed at her disposal, her feelings towards the legatee would undergo a change.

'I'll take it for granted that she means it,' she said presently; 'and I like the way in which she has made me the arbitrator.'

The tone in which she spoke was reassuring to Annie, who thought that she might now push the business a little further with advantage. 'Will you go and see her, Mrs Penbury?'

'N-no. I think I'll write first and call afterwards.'

That would do. Annie had a presentiment that if the two could be brought together there would be no further difficulty, so she bade the widow good-night and left with a light heart. Her next step must be to prepare Miss Barkle for Mrs Penbury's visit, and this was a simple matter.

'Mrs Penbury told me what you had done about the money, this evening, Lina,' she began.

Miss Barkle made a slight gesture, as if to intimate that she wished to drop the subject, and remained silently gazing out of the window. Annie went to her, and putting her arm round her, began again; but her friend once more raised a cautioning hand, and this time spoke herself with an impassive calmness that surprised her: 'It could not buy the fulfilment of my wish, Annie: let us forget that the whole business ever occurred.' There was no suspicion of reproach, no sign of regret for the sacrifice she had made, to be detected in her tone; she had chosen her course, and was apparently satisfied with it.

'What did Mrs Penbury say, Annie?' she asked after a short silence.

'She is going to write, and means to come over and see you soon, Lina.'

Miss Barkle smiled gently. 'Then, if it only rests with me whether we are to be friends or not, there will be nothing in the way,' she said.

Annie said no more; she instinctively felt that this was not the time to tell Miss Barkle that Mrs Penbury's behaviour had given her the impression that the money would be restored, and was by no means sure the widow would wish her to betray what might be called a half-confidence.

Mrs Penbury made her call after having written to Miss Barkle. Both ladies met with the wish and intention of 'being friends;' and the acquaintance begun under such auspices laid the foundation of one of those warm attachments sometimes formed between two most opposite natures.

It is hardly necessary to say that the arrangement regarding the legacy was made known to no one; and the darkness in which Midport was left, led, as already mentioned, to the whole story being discredited. Miss Barkle never referred to it again; but she pondered a good deal on it in secret, often making up her mind to pour the tale into Captain Mulbane's sympathetic ear, and as often changing it, when she thought how uncertain he was of keeping silence. Publicity was not desirable; her action would not be understood, and she could not explain it, for she was able to form a very just idea of the opinion her neighbours would adopt—and freely express—about a woman who made such a sacrifice from such motives as hers.

John Brawen's visits to the cottage to see Annie Carston were becoming marked by a certain reserve in his manner towards Miss Barkle, hardly surprising when we remember that he knew the light in which she had until recently regarded him. On her side, the lady, bearing in mind what she had foregone to retain his friendship, was disappointed and pained. She could not tell him what had prompted her action, and he was hardly likely to guess. Confidence was naturally at an end, and before long Miss Barkle became sensible that the old feeling had given place to one of indifference.

Captain Mulbane, meantime, was waiting until he thought the hour to speak had come. Hope sustained the love-sick man, for Miss Barkle had been very tender to him of late, and he was beginning to feel certain of success. He determined upon committing himself to the deed at length, unable to retain his passion longer. If she didn't accept him now, she never would, and William Mulbane might as well know his fate at once. He made this resolution one evening after dinner—somehow, most of our great resolves are made about that time—and having slept upon it, awoke the next morning firm in his purpose. He was astonished at his own coolness, for he had been contemplating the move earnestly for some days, and too much consideration has sometimes an unsettling effect. The captain was not a careful man in his dress, as a rule; but this morning he arrayed himself with elaborate care, and paid his whiskers more attention than they had been accustomed to for years. Then he did a very rash thing: he strolled into the club to look at the papers before setting out on his mission, and the general magnificence of his get-up excited remark. He had been cool enough until now; but the sly chaff of his friends—some of whom had their suspicions—was too much for him, and he fled out into the street again, feeling that he was a marked man; that every passer-by intuitively knew he was on his way to the cottage to propose to Miss Barkle. The captain grew hot and cold, reckless and timid by turns, a dozen times, before he reached the gate, and when he did, he rang the bell without having even considered the form in which he should put the momentous question. He was given ten minutes' breathing-time in the drawing-room to collect his thoughts and arrange his ideas, but he did not make use of it; he had but one idea in the world at the moment, and that was too much for him. He looked at the pictures and books about the room, and it struck him that it was much like waiting till the dentist was at leisure. If he could only think of some suitable form of words to begin with, he would feel easier. But strive as he would, nothing would suggest itself; and it was in a state of nervousness bordering on imbecility that he heard Miss Barkle's footsteps.

She entered, dressed to go out; and reading the purport of his visit at a glance, seated herself calmly, and waited, whilst he dashed blindly at the object he had in view.

'I came to see you, Miss Barkle,' he began, and stopped. The fact was self-evident; the lady felt that no reply was necessary, so she inclined her head slightly and remained silent. 'To— to speak to you, Miss Barkle, very particularly.' (It was awful; he had no idea it would be so difficult as this.)

'What is it, Captain Mulbane?' said she, so coolly that his heart sank down into his boots.

Ah, now she had brought him face to face with it, but without such help as she had given him last time. Happy thought! He would remind her of 'last time,' by way of preparing her for what he had to say. He wriggled to the extreme edge of his chair and made another plunge. 'Perhaps you remember one evening when I found you—on the beach, Miss Barkle?'

It was not an event the lady was likely to

forget, but why on earth should he come here to speak to her 'particularly' and bring up that? It had no bearing on the business in hand; she was not going to help him; he had been long enough thinking about it, and she gathered up her skirts, as if to rise. 'I remember,' she said, 'but can't conceive why you should refer to it.'

He had offended her! The captain completely lost his head, and threw himself on the sofa at her side, oblivious to everything but her frown. 'Barkle—Miss Lina, I mean—I came to ask—I was going to say—O-oh, Lina!' Words failed him, and he seized her hand, struggling to master his emotion. She let him retain that one, so he put away his handkerchief and possessed himself of the other. It was all over; Miss Barkle turned up her veil. Let us leave them together.

There was a double wedding at Midport a few months later, and amongst the presents received by Mrs William Mulbane was a notification to the effect that, at the request of Mrs George Penbury, Messrs Coutts & Co. had transferred the sum of ten thousand pounds to her name.

Both the Brawens and Mulbanes left Midport; but the story of Miss Barkle's Legacy is told there still with zest by numerous people who really knew all the particulars of the case, but have never yet agreed about them.

WIT IN QUOTATION.

FEW forms of wit are more amusing to most persons than that which consists of the witty use of quotations. A quotation may be apt, yet not witty; but it is impossible for a witty quotation not to be apt. Some persons, like the leader-writers on the *Daily Telegraph*, seem to have swallowed but not wholly assimilated two or three dictionaries of quotations, so full are they of 'extracts from the best authors;' and although their mass of allusions and quotations are frequently apt and to the point, they yet fall short of being witty. No writer ever succeeded in making use of so many witty quotations as Barham, of *Ingoldsby Legends* fame. Hood perhaps comes next; and many examples can be found in the writings of Sydney Smith, Theodore Hook, Byron, and others. Curran, the brilliant Irish advocate, also made use of many witty quotations.

A stock of good quotations and a knowledge of the instances in which certain uncommon words or phrases have been used, are frequently of much service. Thus, when an advocate was arguing against the use of the word 'minstrel,' and urging that before his client could be called by that term, it must be proved that several persons played together, the judge made him collapse by asking, 'Then what about Sir Walter Scott's *Lay of the Last Minstrel*?'

At a dinner given by an American banker a few years ago, somebody asked Lord Houghton if he would take his duck rare. 'Rare! rare!' said his lordship; 'now, there is another of your Americanisms which make it so difficult to understand you. And, pray, what do you mean by "rare?"' An American President piped out from the other end of the table: 'We mean by "rare," my lord, what Dryden meant when he wrote,

"Roast me quickly an egg, and see that it be *rare*." Every one flatters himself that he understands the English language if only he can express his thoughts with tolerable clearness. But this is a popular error. Lord Houghton should have known that the word '*rare*,' in the sense of underdone, was frequently used in Elizabethan literature; and to this day it is to be heard in many parts of England, from Yorkshire to Devonshire. Credit is due to the American who so quickly and effectually responded to his lordship and at the same time taught him a good English word.

Scott, too, once distinguished himself in a somewhat similar manner. A fellow-scholar of his, on being asked, 'What part of speech is "with?"' answered, 'A substantive.' The rector, after a short pause, thought it worth while to ask, 'Is "with" ever a substantive?' but all were silent until Scott's turn came. He instantly responded by quoting a verse of the Book of Judges: 'And Samson said unto her [Delilah], If they bind me with seven green *withs* that were never dried, then shall I be weak, and be as another man.' Readers of Lockhart's admirable biography will remember that there are also several other similar stories told of Scott, and all of these are characteristic, ingenious, and illustrative of his fertility of resource.

An interesting phase of wit in quotation is seen when certain well-known phrases are happily used under different circumstances from those with which they are usually associated. Thus, a Professor of the Edinburgh University having asked Christopher North for the hand of his daughter Jane, Christopher fixed a small ticket to Miss Jane's chest, and announced his decision by thus presenting the young lady to the Professor, who read, 'With the author's compliments.'—Witty, also, was the letter addressed to the owner of a pair of clogs which had been left at the office of the *Century Magazine*, New York. 'Dear Madam,' the editor wrote, 'without expressing any opinion as to the literary merit of the accompanying articles, permit us to say that we think them unsuitable for insertion in our magazine.'—Everybody remembers Hood's witty metamorphosis of the National Anthem: 'A pint of beer among four of us.' Still better was the line in an advertisement written by H. J. Byron, at a time when there was much disturbance in Liverpool regarding the booking-fees at theatres: 'Off with the bob: so much for booking 'em.'

Biblical quotations are frequently used wittily. Although many persons naturally think the language of the Bible should not be used for the purpose, no exception can be taken to the retort of the man who, on entering a barber's shop, at once seated himself in the chair, and in response to the expostulations of the customers, quietly retorted: 'We are told, "the last shall be first."'
—Sydney Smith, again, in reply to Landseer's invitation to him to sit for his portrait, exclaimed, in allusion to the well-known animal painter's ability, 'Is thy servant a *dog* that he should do this thing?'—Several witty scriptural quotations are credited to Bishop Blomfield. Once when he had been present at the consecration of a church where the choral parts of the service had been a failure, he was asked what he thought of the music. 'Well,' he replied, 'at least it was according to Biblical precedent: "the singers went before,

the minstrels followed after.'"
—On another occasion, a friend was interceding with him on behalf of a clergyman who was constantly in debt, and had more than once been insolvent. After praising the talents and eloquence of the impecunious parson, the friend wound up by saying: 'In fact, my lord, he is quite a St Paul.'—'Yes,' said the bishop—"in prisons oft."—Among the witty scriptural quotations attributed to the Presbyterian preacher Mr Paul, is one bearing upon his own name. When about to leave Ayr, he gave a farewell sermon expressly to the ladies, and founded it on the passage, 'All wept sore, and fell upon Paul's neck and kissed him.'—Biblical quotations are only too apt to be used irreverently; and a foreigner who had read some of our standard jest-books might, on reading the English version of the Bible for the first time, urge against it the same argument that the old lady used against *Hamlet*—"that there were too many quotations in it."

To a comparatively small number of people, quotations, however witty, afford no food for laughter because they have little or no knowledge of literature. This fact of course makes the laugh all the more hearty for those who have. One does not need an extensive knowledge of literature, however, to understand and appreciate the quotation made by C. S. Calverley when he, Mr James Payn, and one or two other gentlemen were climbing Scafell from Westwater. The party went up the mountain much too fast for Mr Payn, who toiled after them in vain. 'The labour we delight in *physics* Payn,' said Calverley. Nor is a knowledge of the classics necessary to understand the phrase made use of by Charles Lamb's sister upon seeing the farewell performance of the well-known comic actor, J. S. Munden, and this may be cited in conclusion. 'Well,' she said after the curtain had dropped—"Well, *sic transit gloria Munden*."

THE MONTH:

SCIENCE AND ARTS.

PARIS, like London and other large cities, has found the need of a better water-supply than that which was originally provided for its population. A bold suggestion for solving the problem has been submitted to the city authorities by a Swiss engineer; he proposes that the French capital should draw an inexhaustible supply of pure water from the Lake of Neuchâtel, in Switzerland, at a cost of about twenty millions sterling. The length of the proposed aqueduct, which would include a tunnel twenty-two miles long under the Jura Mountains, is three hundred and twelve miles; and as the lake is sixteen hundred and twenty feet above the mean level of the Paris streets, there would be no chance of failure from want of sufficient gradient. Indeed, it is proposed to deliver the water at a height above that level of four hundred feet, which, with the flow of more than four thousand gallons per second, would give sufficient power to supply all the workshops in the city with motive-force and all the streets with electric light.

A curious bird's-nest has, it is said, been found in one of those Swiss cities where watch-factories abound; it is that of a wagtail, and is composed

almost entirely of steel springs such as are used in the watch-trade.

In the early days of the electric telegraph, great difficulty was experienced in some countries in protecting the wires from the cupidity or superstition of the natives of the districts through which they were carried. Such a thing occurred, according to the *Electrical Review*, in Chili, a difficulty which was solved by a clever stratagem. There happened to be at the time a number of captive Indians in the Chilean camp. These were called together by the general in command of the troops, under whose auspices the telegraph was being established, and he explained to them, that if they touched the wires, their hands would be held fast, and they would be unable to get away. The Indians did not believe this; but the officer, to prove to them that he spoke the truth, requested them to take hold of some wires, connected with a concealed induction coil. This had the usual effect of so cramping the muscles of their fingers that they could not get away, although the general commanded them to let go. The action of the battery was then stopped, and the men were released, with the strict injunction not to tell their countrymen on any account of this secret regarding telegraph wires. Of course this had the desired result; and every Indian was afterwards told in strict confidence about the dreadful result of meddling with the wires.

The *Scientific American* lately contained an illustrated description of an Electric Club which has recently been opened in New York. As its name implies, the Club is fitted with all kinds of electrical contrivances. In the cellar is a powerful steam-engine, to give the necessary motive-power to two dynamos. Associated with these are storage-batteries and apparatus for the general control of the electric currents throughout the building. The entire edifice is lighted by electricity, and the current is utilised in many other ways. For instance, in one room is a stove consisting of a platinum wire, which is carried in zigzag form across a surface of asbestos. When the current passes through this wire it is raised to a white-heat, and communicates that heat to the unflammable asbestos. A boot-blackening machine is another novelty which is worked by a small electric motor. There is an electric safe for the storage of valuables, and an electric door-opener, which the initiated can control by the pressure of a stud in the floor. Although the Club is a social one, it is believed that it will do much to further electrical research, containing as it will a lecture-room furnished with the most recent apparatus and a first-class library.

The truth of the old saying that 'there is nothing like leather,' has been questioned in a very practical manner by an inventor at Nuremberg, who has produced a shoe sole in which leather is conspicuous by its absence. This sole is composed of a network of wire, overlaid with an india-rubber-like substance the composition of which is secret. These soles have, it is said, been well tested in the German army, and have been found to be twice as durable as those of leather, while they are only half the price of the older-fashioned material.

The modern plan of consuming to ashes such refuse as might otherwise become a nuisance dangerous to health is now finding favour in many

cities and towns. At Southampton, the Refuse Destructor, as the furnace is called, is made to do a double duty, for the waste heat from the machine is caused to heat a boiler, the steam from which supplies an engine which in its turn actuates an electric-light dynamo. Other corporations will doubtless profit by this useful example.

Mr Klein recently read a paper before the Middlesex Natural History and Science Society which contained an interesting account of the wholesale destruction of flour by an insect pest imported into this country from the Mediterranean. The flour was stored to the amount of more than one thousand tons in some large warehouses in the east of London. To the dismay of the owners, a large quantity of the valuable food was found to have undergone a change which gave it the appearance of dirty wool, and rendered it quite unfit even for pigs. This change was traced to the larvæ of a certain butterfly, and all attempts to stamp out the plague signally failed. The grubs could be seen in thousands on every sack, and the damage done amounted to hundreds of pounds. At length nature provided the remedy which human skill could not discover. Another change occurred: the tops of the sacks became black as soot with a number of minute flies, whose mission it was to lay their eggs in the bodies of the flour-eating caterpillars and to bring their depredations to an end. We may mention that specimens of the pest in its various stages, together with the exterminating flies, which latter appear to be a new species, are now shown at the Natural History department of the British Museum, Kensington.

The various terrible fires in theatres which have too often shocked the world during the last few years have given rise to many preventive measures, which, however, stop short of the one radical change which should become compulsory; we mean, the lighting of theatres and places of public amusement generally by electricity. The Spanish authorities have already passed a law compelling all theatres in Madrid to adopt the electric light within six months. The engines, dynamos, &c. are to be isolated completely from the main building, and oil-lamps are to be used where supplementary lights are required. Managers of theatres will surely find it to their interest to substitute the new lamps for old ones, for it is well known that the recent disasters in theatres have scared away many of their patrons. The use of a safe method of lighting would speedily restore the lost confidence.

Rats have from time to time been credited with having been the cause of conflagrations, owing to an alleged fondness which they have for lucifer matches. According to *Fire and Water*, a gentleman at Boston, United States, determined to ascertain by experiment whether there was any truth in this allegation. He shut up several rats in a cage, feeding them well, and placing matches within their reach. The first night several matches were ignited by the rats, and not a day passed while the experiment was going on but the same thing happened. The ignition was caused by the rats gnawing the phosphorus ends of the matches, which evidently had some attraction for them. It is now so usual to make use of matches which contain no phosphorus, that the discovery is not so valuable as it would have

been some years back. Still, the observation is a very interesting one.

The late War Office scandal concerning the bayonets and cutlasses which had been supplied to the troops, and which were compared in quality to hoop-iron, is not likely to be repeated, for the authorities have laid down stringent regulations as to the tests to be applied to those weapons before they are issued to the soldiers. These tests consist of, first, a vertical pressure of forty pounds on the hilt of the cutlass, which the weapon must bear without bending; second, an increased pressure until the hilt approaches the point within a few inches; and third, a bending of the blade round a curved surface until hilt and point still more nearly touch one another. The weapons are also to be subjected to blows on a block of wood to test their general soundness.

It has long been a vexed question among artillerymen whether solid steel plate or iron faced with steel is the better material to resist the impact of modern projectiles. To settle this question, the government determined upon a series of careful experiments, which are now being carried on at Portsmouth at the expense of the state. A number of different manufacturers have been invited to supply armour-plates for trial, and these plates are being fired at at very short ranges with chilled iron and forged steel projectiles. So far as the experiments have at present gone, the advantage seems to lie with the use of the compound plates.

A curious corner of old London will, it is said, fall under the auctioneer's hammer during the coming summer; this is Barnard's Inn, the entry of which is a narrow passage turning out of Holborn. The Hall of this inn is the smallest of such erections, measuring only thirty-six feet in length. Its most remarkable feature is the little cupola or louvre of lead which crowns its roof. In olden times, the practice of lighting a fire on a hearth in the centre of a room necessitated an arrangement of the kind for the escape of the smoke. There are very few of these cupolas now remaining. Charles Dickens, who had a most extensive knowledge of London byways, knew Barnard's Inn, and described it as 'the dingiest collection of shabby buildings ever squeezed together in a rank corner as a club for Tom-cats.' The Inn dates from the year 1450, and is hard by that row of ancient overhanging houses which form such a curious contrast to the modern shops of High Holborn.

The government authorities in Ceylon are doing a very good work in restoring the huge tanks or reservoirs by the help of which fertility is ensured over large tracts of that country by the same means as it is in India. In northern Ceylon, one of these restored tanks has recently been opened amid great festivities. This is the Kallawewa tank, which is the largest in the island. It was constructed in the fifth century, but has for a long time been useless in consequence of a great breach in its main wall, one hundred feet broad, which was caused either by a heavy flood or by the act of some long-forgotten invader. The restoration of this tank, which covers an area of seven square miles, has occupied four years. It is connected with a canal fifty-four miles in length, which on its way to the tank supplies a number of detached villages. The breach mentioned above has now

been repaired, and the sluices and other works connected with the tank have been put in order. The boon which this restoration means to the poor agriculturists of the country cannot be over-estimated.

The advantage of underground systems of wires and pipes for the distribution of electricity, water, gas, &c., was well illustrated at New York during the late terrible snowstorm or 'blizzard' which visited that city. Overhead, the telegraph and telephone wires were either broken or rendered dangerous, and impossible to use on account of their entanglement with the electric-light cables, which in that city are also commonly suspended above the streets. But underground in the subways the storm was of course not felt. The gas was duly delivered as usual, and the Steam Supply Company provided for their clients their accustomed amount of heat.

In Boston, a different form of heat-distribution has been provided. Thirteen thousand feet of piping have been laid under the streets of that city for a public supply of hot water under great pressure. These pipes are covered with a non-conducting preparation, so that they may retain as much of their initial heat as possible, which heat, by the way, is far above the usual boiling-point. By means of reducing valves, the initial pressure of three hundred pounds on the square inch can be reduced to a more convenient pressure at the issuing point, where the water will be allowed to expand into steam, and can be used for heating and other purposes. The hot water not used goes back to headquarters by a return main.

On the Midland Railway, a train is now in regular service between Derby and Manchester lighted by electricity on a new system. The method adopted is that of Mr Timmiss of Westminster, and it has now been in efficient operation for some weeks. Under each carriage are placed store-cells, or secondary batteries, which are charged by a dynamo machine at Derby whenever necessary. These batteries supply an electric current to 'Swan' incandescent lamps, two of which are placed in each compartment of the train. The electric current is under the control of the guard, who, by means of a switch, can put the lamps in action or extinguish them as may be required. But the novelty of the system consists in the method by which each carriage is independent of its neighbours; that is to say, if by any means a carriage should become detached, its lamps will be automatically lighted up, and will remain lighted until the cells are exhausted. The cost of lighting a train of average length is said to be equal to the consumption of half a pound of coal per mile.

It will be remembered that a short time ago, in view of increasing the carrying capacity of the Suez Canal, it was determined both to widen and deepen that international water-way, and also, if possible, to enable ships to continue their journey through it by night. A scheme has now been formulated to carry the lighting of the canal into operation. The system which has been selected, after consideration of electricity, oil, and gas as light-producers, is that of compressed oil-gas on buoys and fixed standards. The buoys lighted by Pintsch's oil-gas have been well tested now in various parts of the world, and can be made of sufficient capacity to hold a supply of gas for two

months' consecutive burning. A further provision is found in the lighting of the ships themselves; and before the vessel is allowed to pass through the canal at night, the officials in charge must be satisfied that it contains the necessary lighting power. This is to consist of a powerful head-light, capable of throwing an electric beam for thirteen hundred yards. Each ship must also have another electric lamp suspended over its deck, which will give an all-round light fully two hundred yards in diameter. A very perfect system of signalling by means of lights of different colours and different positions is also comprised in the scheme. This system of lighting the canal may be looked upon as provisional until such time as it may be absolutely necessary to carry out the widening and deepening of the channel.

Some curious meteorological phenomena have recently been observed in Mexico, which are attributed to the laying of a line of railway there. A great deal of damage has occurred on the Mexico Central Railroad, due to the bursting of waterspouts on the track. The engineers have also noted that as fast as the line advances the rain seems to follow. These curious results are supposed to be due to some attractive force induced by the use of the large mass of metal employed in making the road, the waterspouts seeming to be attracted by both the rails and the telegraph wires. The matter is receiving the attention of scientific men in the country.

Something of a novelty in the way of guide-books has recently been published by Longley (39 Warwick Lane, London). The price of each is one penny. These guide-books are illustrated, and are constructed in a comprehensive and exact manner, the facts being concisely given and with evident accuracy. The books embrace almost all the chief places of resort in England, Scotland, and Ireland, while some of them apply to places on the Continent.

STEAM-CANOE BUILT OF DELTA METAL.

In a recent number of the *Journal* we drew attention to the many advantages accruing from the employment of a comparatively new alloy known as Delta Metal. Our remarks have just received a practical illustration in the construction of a novel craft built for exceptional purposes. The *Nyassa* steam-canoe, constructed for the Universities' African Mission Society, for service on the lake bearing that name, is composed entirely of Delta Metal, a material equal in strength to steel, and practically incorrodible. In tropical waters saturated with decomposing vegetable matter, iron or steel would rapidly corrode, even if continually painted by skilled labour—a difficulty in remote regions—hence the adoption of Delta Metal. The attacks of white ants render wood impracticable for boat-building.

The *Nyassa* has been built in three sections, as she will have to be transported on men's backs from the coast to Lake Nyassa—a considerable distance. The little craft has been built as a 'Mersey canoe,' being required for sailing as well as for steaming on a lake noted for its boisterous weather. The engine can be taken out of the boat and replaced within a few hours, and the change from steamer to sailing-vessel effected by unskilled labourers.

The *Nyassa* has two masts, the mainmast having a copper lightning-conductor. The boiler-furnace has been specially designed for consumption of wood and similar fuel found in tropical countries. Air-tight bulkheads are provided. The vessel is twenty-one feet long, with a beam of seven feet and a depth of three feet, and draws only sixteen inches with engine and boiler on board. At recent tests made in the open sea, the *Nyassa* proved to have good sailing-powers with engine and boiler on board, and in every way fully justified the expectations of her designers and builders.

THE DAUGHTER.

My little daughter grows apace;
Her dolls are now quite out of date;
It seems that I must take their place,
We have become such friends of late,
We might be ministers of state,
Discussing projects of great peril,
Such strange new questionings dilate
The beauty of my little girl.

How tall she grows! What subtle grace
Doth every movement animate;
With garments gathered for the race
She stands, a goddess slim and straight.
Young Artemis, when *she* was eight
Among the myrtle-bloom and laurel—
I doubt if she could more than mate
The beauty of my little girl.

The baby passes from her face,
Leaving the lines more delicate,
Till in her features I can trace
Her mother's smile, serene, sedate.
'Tis something at the hands of fate,
To watch the onward years unfurl
Each line which goes to consecrate
The beauty of my little girl.

ENVOY.

Lord! hear me, as in prayer I wait.
Thou givest all; guard Thou my pearl;
And, when Thou countest at the Gate
Thy jewels, count my little girl.

J. B. S.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

'THE STRANGER'S COLD.'

A TRADITION OF ST KILDA.

PERHAPS the most remarkable fact with which recent intercourse with the dwellers in the remote island of St Kilda has made us familiar is the existence of an illness which so far has baffled all attempts at explanation. Every visitor has remarked that there is a local tradition that a species of influenza known as 'stranger's cold' follows the arrival of a vessel from the mainland. Martin, the Herodotus of the Western Isles of Scotland, in his account of St Kilda (second edition, 'very much corrected;' London, 1716), says: 'The inhabitants are about two hundred in number, and are well proportioned; they speak the Irish language only; their habit is much like that us'd in the adjacent isles, but coarser. They are not subject to many diseases; they contract a cough as often as any strangers land and stay for any time among them, and it continues for some eight or ten days; they say the very infants on the breast are infected by it.'

The next historian of importance of St Kilda was the Rev. Aulay Macaulay, minister of Ardnarmurchan, and great-grandfather of Lord Macaulay. It is an odd circumstance that it is his mention of the 'stranger's cough' in his History of St Kilda which has, through the medium of Dr Johnson, secured him a niche in the temple of fame. Dr Johnson's reasons for liking the book are explained by Sir George Trevelyan in his *Life* of his uncle: 'Mr Macaulay had recorded the belief prevalent in St Kilda, that as soon as the factor landed on the island, all the inhabitants had an attack, which from the account appears to have partaken of the nature both of influenza and bronchitis. This touched the superstitious vein in Johnson, who praised him for his "magnanimity" in venturing to chronicle so questionable a phenomenon; the more so because—said the Doctor—"Macaulay set out with a prejudice against prejudice, and wanted to be a smart modern thinker." To a reader of our day, the

History of St Kilda appears to be innocent of any trace of such pretension, unless it be that the author speaks slightly of second-sight, a subject for which Johnson always had a strong hankering.'

Despite this measure of praise for Macaulay's book, Dr Johnson did not, at least openly, accept his account of the stranger's cold. 'How can there be a physical effect without a physical cause?' he asked. 'The arrival of a shipful of strangers would kill them; for, if one stranger gives them one cold, two strangers must give them two colds, and so in proportion.' To the argument that Martin and Macaulay's statements were confirmed by the fact, that on the annual visit of Macleod of Macleod's steward all the St Kildans caught cold, Dr Johnson chaffingly replied: 'The steward always comes to demand something from them, and so they fall a-coughing.'

Macculloch, our next authority, was as sceptical as Johnson. We adopt Mr Seton's abstract of Macculloch in his useful *St Kilda, Past and Present* (Edinburgh, 1878): "In hopes of hearing the whole island join in one universal chorus of sneezing," he watched with great anxiety; but no sneezing was heard, and none did cry, "God bless him!" He then ironically says that the perfection of faith is to believe against our senses, and that although the event could scarcely be concealed in the limited number of pocket-handkerchiefs which the islanders possessed, nevertheless, nobody doubted that it was an actual fact. "Everybody had witnessed it, from Martin to Macaulay; everybody believed it, from Macaulay to the present day; the whole island—including the minister's wife, then regent of St Kilda—was agreed upon it, and who, then, dared to doubt?"

'The Doctor appears to have expected to witness an immediate visitation. "Everybody looked at every other's nose; but not a drop of dew was distilled, and not a sneeze consented to raise St Kilda's echoes." He proceeds to quiz the would-be philosophers who must find a *cause* for everything. "It is all owing," say some of these wise personages, "to the east wind: *causa pro non causa*;

because this is precisely the wind which prevents any boat from landing on the island." Among other humorous solutions, he suggests the idea of strangers being naturally welcomed by a sneeze instead of a kiss of peace—a trifling modification of the well-known salutation by noses in which certain nations indulge.

All this is very fair funning; but the fact remains that all visitors except the Doctor have had ample opportunities of noting the illness. A day or two after the departure of *H.M.S. Porcupine* in 1860, the entire population was afflicted with 'the trouble.' Mr Morgan arrived ten days after the *Porcupine*, and saw the actual progress of the illness; and, unexpectedly bearing out the most dubious part of Martin's account, he says he saw an infant not more than a fortnight old suffering severely after the visit of the factor's smack in 1876; and after the wreck of the Austrian ship *Peti Dubrovacki*, in January 1877, the same illness appeared. So recently as the visit of the Crofters' Commission, the minister mentioned in his evidence the invariable occurrence of the illness after the visit of a strange ship. Mr Seton says the St Kildans allege that the illness is most severe when the visitors come from Harris, and that they suffer less when the vessel comes from Glasgow or more distant ports. The disease 'usually begins with a cold sensation, pain and stiffness in the muscles of the jaw, aching in the head and bones, and great lassitude and depression—the ordinary symptoms of catarrh in an aggravated form—and is accompanied by a discharge from the nose, a rapid pulse, and a severe cough, which is particularly harassing during the night. The malady first attacks those persons who have come most closely into contact with the strangers, and then extends itself over the whole community.'

It is natural that a disease so remarkable should attract attention. Assuming it to be peculiar to St Kilda, the explanations of its origin are numerous and fanciful. A friend of Dr Johnson's, Mr Christian of Dorking, and, in later years, Mr Frank Buckland, came to the conclusion that the illness was due to the wind blowing at the time of the strangers' arrival, not to the strangers themselves. This was on the erroneous assumption that a landing could only be obtained if the wind was north-east or east. Others found a sufficient cause in the exposure of the islanders when they ran into the sea to help strangers to land. It was open for every man to explain the phenomenon for himself. What was certain was the existence of a disease—sometimes fatal—which was never known in the island except when strangers visited it. Its existence was undoubted, but its cause seemed beyond discovery. We cannot be said to have advanced very far yet in our knowledge of the illness; but some light has been thrown on the subject by turning inquiry away from the Western Islands to distant lands and peoples widely differing in race and customs, and subject to climatic influences of an entirely different kind.

Mr Seton was probably among the first to point out that a similar disease was alleged to have caused the extinction of certain tribes on the Amazon. The disease always appears, it is said, 'when a village is visited by people from the civilised settlements. The disorder has been known to break out when the visitors were entirely free from it, the simple contact of civilised men in

some mysterious way being sufficient to create it.' (Bates: *The Naturalist on the River Amazon*.) Again, in the chronicle of the Duke of Edinburgh's cruise in *H.M.S. Galatea* in 1867-68, it is noted: 'Tristan d'Acunha is a remarkably healthy island; but it is a singular fact that any vessel touching there from St Helena invariably brings with it a disease resembling influenza.'

This is curiously illustrated by some remarks of Miss Gordon Cumming in her *Cruise in a French Man-of-War*. Speaking of Tauna, in the South Pacific, she says, such of the medicine-men of Tauna as were opposed to missionaries 'stirred up the islanders generally to believe that the dysentery, coughs, and influenza which had recently for the first time appeared in the group were all produced by the white men; and, strangely enough, their assertion seemed confirmed by the fact that the tribe among whom the missionaries were living escaped these illnesses.'

Owing to the belief that the white men brought disease, the missionaries were afterwards driven from Tauna: dysentery appeared in the neighbouring isle of Fotuna, and led to the massacre of the Samoan teachers who had been left there by Mr Williams. It also ravaged Eromanga, carrying off one-third of the population, who believed that the scourge had been introduced by some hatchets which they had received as barter from a sandal-wood ship, and accordingly they threw them all away. On several other islands the teachers were either murdered or compelled to flee for their lives, solely on this account. 'What makes this more remarkable is, that these illnesses often followed the visit of a ship which itself had a perfectly clean bill of health; and in many cases the missionaries and other good authorities recorded that they had no reason to believe that any white man had been to blame for the introduction of new diseases.'

Again, the people of Nivē or Savage Island, the centre of the triangle formed by Tonga, Samoa, and the Hervey Islands, when first visited by Dr Turner were found to have an invariable habit of killing all strangers, not only white men, but also 'men whose canoes chanced to drift from Tonga to Samoa, or even their own countrymen who had left the island and returned. All such were invariably killed, chiefly from a dread lest they should introduce foreign diseases. So great was this fear, that even when they did venture to begin trading, they would not use anything obtained from ships till it had been hung in quarantine in the bush for weeks.' Finally, Miss Cumming states generally that influenza was unknown all over Polynesia until the white man's advent.

In the *British Medical Journal* of September 4, 1886, Mr R. Augustine Chudleigh describes a similar disease among the Maoris which is known as *murri-murri*. He refers particularly to the 'case of the island of Wharekauri, one of the Chatham group, about four hundred and eighty miles east of New Zealand, nearly at the antipodes of St Kilda, where, under the name of *murri-murri*, an identical disorder, with a similar alleged origin, is now frequent. In its main features, *murri-murri* is indistinguishable from a severe influenza cold. Its invasion may occupy four hours; the patient remains "intensely miserable" for about four days, when the disorder gradually

dies away. No period of incubation precedes, and no permanent ill effects are observed to follow. One attack does not preclude the recurrence, and European residents, as well as Maori and Muriari natives, are liable to the disorder. In order to be infected, a person need not know that a ship has come; indeed, the mere appearance of *murri-murri* is proof to the inhabitants—even at distant parts of the island, which is thirty miles long—that a ship is in port, inasmuch that, on no other evidence, people have actually ridden off to Waitangi to fetch their letters. There is a hill whence one can see across the island into Waitangi Bay; and people are wont to climb this hill and scan the bay for a ship on no other evidence than the recurrence of *murri-murri*. It is very curious that the name of that hill is Mount Dieffenbach, and that the ship which would have been described thence would almost certainly have been the *St Kilda*, which for many years did the trade of the islands. There may have been connection between *St Kilda* and *Wharekauri*.

As regards the conclusion of the foregoing paragraph, it is only necessary to say that the occurrence of the name '*St Kilda*' is one of those remarkable coincidences across which we stumble from time to time, but that is all. There is certainly no 'connection between *St Kilda* and *Wharekauri*,' nor would it explain either 'the stranger's cold' or *murri-murri* if there were.

And so 'the stranger's cold' remains to this day a curious mystery, not peculiar to *St Kilda*, as the old writers fancied, but to be found wherever an isolated population is visited at infrequent intervals by persons of what may be called a later civilisation.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XXIV.—THE BALANCE QUIVERS.

MARCH, April, May passed away: anemones and asphodels came and went; narcissus and globe-flower bloomed and withered; and Warren Relf, cruising about in the *Mud-Turtle* round the peacock-blue bays and indentations of the Genoese Riviera, had spent many cloudless days in quiet happiness at the pretty little villa among the clambering olive terraces on the slopes at San Remo. Elsie had learnt at least to tolerate his presence now: she no longer blushed a vivid crimson when she saw him coming up the zigzag roadway; she wasn't much more awkward before him, in fact, than with other creatures of his sex in general; nay, more, as a mere friend she rather liked and enjoyed his society than otherwise. Not to have liked Warren Relf, indeed, would have been quite unpardonable. The Relfs had all shown her so much kindness, and Warren himself had been so chivalrously courteous, that even a heart of stone might surely have melted somewhat towards the manly young painter. And Elsie's heart, in spite of Hugh's unkindness, was by no means stony. She found Warren, in his rough sailor clothes, always gentle, always unobtrusive, always thoughtful, always considerate; and as Edie's brother, she got on with him quite as comfortably in the longrun as could be expected of anybody under such trying circumstances.

At first, to be sure, she couldn't be induced to board the deck of the busy little *Mud-Turtle*. But as May came round with its warm Italian sunshine, Edie so absolutely insisted on her taking a trip with them along that enchanted coast towards Monaco and Villefranche, beneath the ramping crags of the Tête du Chien, that Elsie at last gave way in silence, and accompanied them round the bays and headlands and roadsteads of the Riviera on more than one delightful outing. Edie was beginning, by her simple domestic faith in her brother's profound artistic powers, to inspire Elsie, too, with a new sort of interest in Warren's future. It began to dawn upon her slowly, in a dim chaotic fashion, that Warren had really a most unusual love for the byways of nature, and a singular faculty for reading and interpreting with loving skill her hidden hieroglyphics. 'My dear,' Edie said to her once, as they sat on deck and watched Warren labouring with ceaseless care at the minute growth of a spreading stain on a bare wall of seaward rock, 'he *shall* succeed—he *must* succeed! I mean to make him. He shall be hung. A man who can turn out work like that must secure in the end his recognition.'

'I don't want recognition,' Warren answered slowly, putting a few more lingering microscopic touches to the wee curved frondlets of the creeping lichen. 'I do it because I like to do it. The work itself is its own reward. If only I could earn enough to save you and the dear old Mater from having to toil and moil like a pair of galley-slaves, Edie, I should be amply satisfied, and more than satisfied.—I confess I should like to do that, of course. In art, as elsewhere, the labourer is worthy of his hire, no doubt: he would prefer to earn his own bread and butter. It's hard to work and work, and work and work, and get scarcely any sale after all for one's pictures.'

'It'll come in time,' Edie answered, nodding sagaciously. 'People will find out they're compelled at last to recognise your genius. And that's the best success of all, in the longrun—the success that comes without one's ever seeking it. The men who aim at succeeding, succeed for a day. The men who work at their art for their art's sake and leave success to mind its own business, are the men who finally live for ever.'

'It doesn't do them much good, though, I'm afraid,' Warren answered, with a sigh, hardly looking up from his fragments of orange-brown vegetation. 'They seldom live to see their final triumph.'

For praise is his who builds for his own age;
But he that builds for time, must look to time for wage!

As he said it, he glanced aside nervously at Elsie. What a slip of the tongue! Without remembering for a moment whom he was quoting, he had quoted with thoughtless ease a familiar couplet from the *Echoes from Callimachus*.

Elsie's face showed no passing sign of recognition, however. Perhaps she had never read the lines he was thinking of; perhaps, if she had, she had quite forgotten them. At anyrate, she only murmured reflectively to Edie: 'I think, with you, Mr Relf *must* succeed in the end.'

But how soon, it would be difficult to say. He'll have to educate his public, to begin with, up to his own level. When I first saw his work, I could see very little to praise in it. Now, every day, I see more and more. It's like all good work; it gains upon you as you study it closely.'

Warren turned round to her with a face like a girl's. 'Thank you,' he said gently, and said no more. But she could see that her praise had moved him to the core. For two or three minutes he left off painting; he only fumbled with a dry brush at the outline of the lichens, and pretended to be making invisible improvements in the petty details of his delicate foreground. She observed that his hand was trembling too much to continue work. After a short pause he laid down his palette and colours. 'I shall leave off now,' he said, 'till the sun gets lower; it's too hot just at present to paint properly.'

Elsie pitied the poor young man from the bottom of her heart. She was really afraid he was falling in love with her. And if only he knew how hopeless that would be! She had a heart once; and Hugh had broken it.

That evening, in the sacred recess of Elsie's room, Edie and Elsie talked things over together in girlish confidence. The summer was coming on apace now. What was Elsie to do when the Relfs returned, as they must return, to England?

She could never go back. That was a fixed point, round which as pivot the rest of the question revolved vaguely. She could never expose herself to the bare chance of meeting Hugh and—and Mrs Massinger. She didn't say so, of course; no need to say it; she was far too profoundly wounded for that. But Edie and she both took it for granted in perfect silence. They understood one another, and wanted no language to communicate their feelings.

Suddenly, Edie had a bright idea: why not go to St Martin de Lantosque?

'Where's St Martin de Lantosque?' Elsie asked languidly. Her own future was not a subject that aroused in her mind any profound or enthusiastic interest.

'St Martin de Lantosque, my dear,' Edie answered with her brisker, more matter-of-fact manner, 'is a sort of patent safety-valve or overflow cistern for the surplus material of the Nice season. As soon as the summer grows unendurably hot on the Promenade des Anglais, the population of the *pensions* and hotels on the sea-front manifest a mutually repulsive influence—like the particles of a gas, according to that prodigiously learned book you teach the girls elementary physics out of. The heat, in fact, acts expansively; it drives them forcibly apart in all directions—some to England, some to St Petersburg, some to America, and some to the Italian lakes or the Bernese Oberland. Well, that's what becomes of most of them: they melt away into different atmospheres. But a few visitors—the people with families who make Nice their real home, not the mere sun-worshippers who want to loll on the chairs on the Quai Masséna or in the Jardin Public, retire for the summer only just as far as St Martin de Lantosque. It's

a jolly little place, right up among the mountains, thirty miles or so behind Nice, as beautiful as a butterfly, and as cool as a cucumber, and supplied with all the necessities of life from afternoon tea to a consular chaplain. It's surrounded by the eternal snows, if you like them eternal; and well situated for penny ices, if you prefer your glaciers in that mitigated condition. And if you went there, you might manage to combine business with pleasure, you see, by giving lessons to the miserable remnants of the Nice season. Lots of the families must have little girls: lots of the little girls must be pining for instruction: lots of the mammas must be eager to find suitable companionship; and a Girtton graduate's the very person to supply them all with just what they want in the finest perfection. We'll look the matter up, Elsie. I spy an opening.'

'Will your brother come here next winter, Edie?'

'I know no just cause or impediment why he shouldn't, my dear. He usually does one winter with another. It's a way he has, to follow his family. He takes his pleasure out in the exercise of the domestic affections.—But why do you ask me?'

'Because'—and Elsie hesitated for a moment—'I think—if he does—I oughtn't to stay here.'

'Nonsense, my dear,' Edie answered promptly. It was the best way to treat Elsie. 'You needn't be afraid. I know what you mean. But don't distress yourself: men's hearts will stand a fearful deal of breaking. It doesn't hurt them. They're coarse earthenware to our egg-shell porcelain. He must just pine away with unrequited affection in his own way as long as he likes. Never mind him. It'll do him good. It's yourself and ourselves you've got to think of. He's quite happy as long as he's allowed to paint his own unsaleable pictures in peace and quietness.'

'I wish he could sell them,' Elsie went on reflectively. 'I really do. It's a shame a man who can paint so beautifully and so poetically as he does should have to wait so long and patiently for his recognition. He strikes too high a note; that's what's the matter. And yet I wouldn't like to see him try any lower one. I didn't understand him at first, myself; and I'm sure I find as much in nature as most people.—But you want to have looked at things for some time together, through his pair of spectacles, before you can catch them exactly as he does. The eye that sees is half the vision.'

'My dear,' Edie answered in her cheery way, 'we'll make him succeed. We'll push him and pull him. He'll never do it if he's left to his own devices, I'm sure. He's too utterly wrapped up in his work itself to think much of the reception the mere vulgar picture-buying world accords it. The chink of the guinea never distracts his ear from higher music. But I'm a practical person, thank heaven—a woman of affairs—and I mean to advertise him. They ought to hang him, and he shall be hung. I'm going to see to it. I shall get Mr Hatherley to crack him up—Mr Hatherley has such a lot of influence, you know, with the newspapers. Let's roll the log with cheerful persistence. We shall float him yet; you see if we don't. He shall be Warren Relf,

R.A., with a tail to his name, before you and I have done launching him.'

'I hope so,' Elsie murmured with a quiet sigh.

If Warren Relf could have heard that conversation, he might have plucked up heart of grace indeed for the future. When a woman begins to feel a living interest in a man's career, there's hope for him yet in that woman's affections. Though, to be sure, Elsie herself would have been shocked to believe it. She cherished her sorrow still in her heart of hearts as her dearest chattel, her most sacred possession. She brought incense and tears to it daily with pious awe. Woman-like, she loved to take it out of its shrine and cry over it each night in her own room alone, as a religious exercise. She was faithful to the Hugh that had never been, though the Hugh that really was had proved so utterly base and unworthy of her. For that first Hugh's sake, she would never love any other man. She could only feel for Warren Relf the merest sisterly interest and grateful friendship.

However, we must be practical, come what may; we must eat and drink though our hearts ache. So it was arranged at last that Elsie should retire for the summer to the cool shades of St Martin de Lantosque; while the Relfs returned to their tiny house at 128 Bletchingley Road, London, W. A few pupils were even secured by hook and by crook for the off-season, and a home provided for Elsie with an American family, in search of culture in the cheapest market, who had hired a villa in the patent safety-valve, to avoid the ever unpleasant necessity for returning to the land of their birth, across the stormy millpond, for the hot summer. The day before the Relfs took their departure from San Remo, Elsie had a few words alone with Warren in the pretty garden of the Villa Rossa. There was one thing she wanted to ask him particularly—a special favour, yet a very delicate one. 'Shall you be down about the coast of Suffolk much this year?' she asked timidly. And Warren gathered at once what she meant. 'Yes,' he answered in almost as hesitating a voice as her own, looking down at the prickly-pears and green lizards by his feet, and keeping his eyes studiously from meeting hers; 'I shall be cruising round, no doubt, at Yarmouth and Whitestrand and Lowestoft and Aldeburgh.'

She noticed how ingeniously he had mixed them all up together in a single list, as if none were more interesting to her mind than the other; and she added in an almost inaudible voice: 'If you go to Whitestrand, I wish very much you would let me know about poor dear Winifred.'

'I will let you know,' he answered, with a bound of his heart, proud even to be intrusted with that doubtful commission. 'I'll make it my business to go there almost at once.—And I may write and tell you how I find her, mayn't I?'

Elsie drew back, a little frightened at his request. 'Eddie could tell me, couldn't she? That would save you the trouble,' she murmured after a pause, not without some faint undercurrent of conscious hypocrisy.

His face fell. He was disappointed that he might not write to her himself on so neutral a

matter. 'As you will,' he answered with a down-cast look. 'Eddie shall do it, then.'

Elsie's heart was divided within her. She saw her reply had hurt and distressed him. He was *such* a good fellow, and he would be so pleased to write. But if only he knew how hopeless it was! What folly to encourage him, when nothing on earth could ever come of it! She wished she knew what she ought to do under these trying circumstances. Gratitude would urge her to say Yes, of course; but regard for his own happiness would make her say No with crushing promptitude. It was better he should understand at once, without appeal, that it was quite impossible—a dream of the wildest. She glanced at him shyly and caught his eye; she fancied it was just a trifle dimmed. She was *so* sorry for him. 'Very well, Mr Relf,' she murmured, relenting and taking his hand for a moment to say good-bye. 'You can write yourself, if it's not too much trouble.'

Warren's heart gave a great jump. 'Thank you,' he said, wringing her hand, oh, so hard! 'You are very kind.—Good-bye, Miss Challoner.' And he raised his hat and departed all tremulous. He went down that afternoon to the *Mud-Turtle* in the harbour the happiest man alive in the whole of San Remo.

UNPROFESSIONAL TRAMPING.

WE have never been able satisfactorily to account for the fact that in the athletic England of to-day walking for recreation should find so little favour. Very odd excuses for not caring about what is agreed to be, notwithstanding its apparently tame character, the most perfect form of bodily exercise, are given by men who, at two very beautiful and suitable seasons of the year—namely, just before and just after summer—having no opportunities for hunting, shooting, or fishing, and being past football, do little but long for the next cricket or rowing season. 'What's the fun of trudging, when you can ride?'—'Haven't been accustomed to it, and couldn't keep it up.'—'Beastly slow work;' and so on. Vainly has the writer held up attractive pictures, drawn from his walking experiences in many lands, of the splendid physical satisfaction derived therefrom, of the odd-and-end knowledge picked up, of the little episodes and adventures which keep things lively, of the pleasure of treading unbeaten tracks, and of exploring human and natural worlds, which, although they often lie at our very doors, are as often quite *terra incognita*; and above all, of the glorious independence of the pedestrian. At the most, he has extracted half-promises to 'have a shot at it,' and very little more.

My memories of pedestrian expeditions extend over a large and varied tract of country, and are of the most pleasant character; and such as are not vividly impressed on my mind are to be found in the pages of some score of battered, travel-worn, weather-stained sketch-books, the sketch-book being almost as necessary an item of the pedestrian's outfit as a knapsack. I have

walked in Japan and China, in Italy, Sicily, France, Germany, Switzerland, and Belgium—not mere before-lunch walks, be it understood, but good honest tramps, extending in some cases over a week. But one turns naturally first to the mother-country; and what there is to be seen, and even discovered, in the mother-country by men who ever fly abroad at the first opportunity, can only be satisfactorily proved by the pedestrian. A very good rule, I have found, in planning a walking tour is to have some other object in view than the mere accomplishment within a certain time of a certain distance, or even than the fixing of certain points to be attained. Trace the course of an old road, be it a Roman *via*, or a British trackway, or a pilgrim path: tread in the footsteps of a favourite author who has immortalised certain scenes—accompany Charles Dickens in Kent, or Mr Blackmore or Charles Kingsley in Devonshire, or be with Sir Walter Scott or George Eliot or Henry Fielding—do anything, in fact, to give a zest to the journey but merely jot down a lot of towns and villages, and arrange to reach them at certain times regardless of attractions by the road, as is the too common fault of bicyclists at home and tourists abroad, and which may account for the stern, business-like expression on the faces of so many of the former, and of the air of listless boredom or frantic haste exhibited by the latter.

Make one of these ideas but an excuse for taking a certain line of country, and it is remarkable how many additional and unexpected attractions crop up during the journey. Inspiration to carry out these ideas generally comes when least expected. A casual allusion to Thomas à Becket induced the writer to take one of the pleasantest tramps he can recall. It was not along the old road followed by the immortal pilgrims of Chaucer, but along an obscure, little-known track used by the pilgrims from the North and the Midlands, and which, after the lapse of so many years, is still known as 'The Old Pilgrim's.' It enters Kent at Tatsfield above Westerham, proceeds across Chevening Park to Otford, by Kemsing, Snodland, Boxley, and Harrietsham, to the 'little village of Charing,' whence it is traceable by Eastwell Park and Wye into Canterbury. The path, in some places barely discernible, in others a good high-road, follows the line of ancient yew-trees dotted along the hillsides above it, rarely touches towns and villages, and is not only beautiful in itself, but abounds with objects of romantic and historic interest. Its length is about forty-four miles, and it can be comfortably done in two days, making Charing the halting-place.

The perusal of *Great Expectations* brought about an exploration of that little-known corner of Kent, north of Rochester, known as 'No Man's Land,' whence the walk may be extended round the Isle of Sheppey into Faversham; whilst *Pickwick* and *Edwin Drood* suggest Rochester and its neighbourhood.

A conversation about smuggling took me down to Hythe, whence was made a two-days' exploration of that quiet, solitary region of Romney Marsh, all about which are interesting relics of

the days of the Cinque Ports' grandeur in the shape of old towns long deserted by the sea; returning Londonwards by the smugglers' road to Tunbridge by Cranbrook and Gondhurst.

Surrey is a better known region; but there are many men to whom that exquisitely beautiful line of breezy commons, dotted with picturesque old villages, which runs at the foot of the range of hills broken by Reigate, Dorking, and Guildford, is familiar, who do not know that on the Sussex border there is a part of sequestered Surrey, stretching between Oxted and Farnham, which is well worthy of a two days' walk, the half-way point being Ockley on the old Roman Stane Street.

Of Sussex, a beautiful and interesting county, little is known beyond the driving radii of its great watering-places; yet in Sussex there are at least three good walks which repay trouble. West Sussex may be conveniently explored in two days by starting from Haslemere and working down by Midhurst, Petworth, and Pulborough to Storrington; and upon the next day by West Grinstead and Balcombe to East Grinstead. Sufficient of East Sussex may be seen, also in two days, by starting from East Grinstead, proceeding through the heart of the seat of the once famous Sussex iron industry, full of quaint places, which still retain to a surprising extent the customs and traditions of former days, through Fletching and Isfield to East Hoathley, working up the next day by Chiddingley, Warbleton, Heathfield, and Mayfield to Crowborough Cross. Another good Sussex walk is to follow the Roman Stane Street from Chichester into Surrey.

Just as *Great Expectations* and *Pickwick* suggested Kentish walks, as *Lorna Doone* and *Westward Ho* took me to North Devon, so did *Nicholas Nickleby* send me away far north to Barnard Castle, on the borders of Durham and Yorkshire. Equally with Dickens is Sir Walter Scott associated with Barnard Castle; and there are few better centres for pedestrian exploration than the quaint old Durham town on the Tees, around which cling so many memories of Rokeby, of Master Humphrey the Clockmaker, and of Wackford Squeers. The twenty-five-mile walk into Barnard Castle from the city of Durham is during its latter half interesting and beautiful; but the first ten miles run through a country of coal-pits and their grim surroundings. The shorter walk from Darlington along the Tees river is to be preferred. All around Barnard Castle there are interesting goals for the pleasure-tramp. The road by Egglestone Abbey and through Rokeby Park leads us to the village of Greta Bridge, on a branch of the old Watling Street. Thence we pass along a deserted, lonely road, running straight, as it was built by the Roman engineers, into Bowes. Here is Dotheboys Hall, the last and the pleasantest-looking house in the village, access to which must be gained by stratagem, for the Bowes people do not revere the memory of Charles Dickens, and declare that his successful crusade against the Yorkshire schools ruined their town, whereas in reality the railway ruined it, by driving off the road the dozen mailcoaches which used to change horses at the *Unicorn* daily on their way to and from Scotland.

The lover of wild scenery may continue on along the old Roman road, past Spittal, where was enacted the tragedy of the 'Hand of Glory,' up to that lonely monument amidst the remains of the Roman camp on the summit of Stanemore, which anciently marked the boundary of the kingdoms of England and Scotland, and now that of the counties of Yorkshire and Westmorland, and return over the wild solitary moorland, or go on to Brough. The mention of Westmorland tempts me to speak of walking in the Lake district; but as the Lake routes are as well known as the streets of London, 'fresh woods and pastures new' are of more general interest.

A well-filled sketch-book reminds me of two most enjoyable expeditions I made along the course of the Roman Wall from coast to coast; and to the man who does not mind a little rough work, no more pleasant and interesting fields for exploration can be recommended. I have traversed these mighty relics both from west to east and from east to west, and I unhesitatingly recommend the latter course, for the reason that the interest increases as one advances. As, after the first twenty miles from Newcastle, there is but little road-work, but an alternate scrambling up and down rocky hills and crossing fields, and as there is so much of interest, which must on no account be missed, off the actual line of the Wall—Hexham and Brampton towns, Lanercost Priory and Naworth Castle *inter multis aliis*—six days cannot be considered too much in order to explore conscientiously from Newcastle-on-Tyne to Bowness, on the Solway, although the distance is but seventy-five miles.

Having exhausted the Roman Wall, if that is possible, I confidently recommend the tramp to devote eight days to a tour of Northumberland, starting from Hexham, finishing at Morpeth, and taking *en route* Otterburn, High Rochester, the wild fells, Glanton, Wooler, Flodden Field, Ford Castle, Norham Castle, along the Tweed to Berwick; and descending the east coast by Holy Island, Belford, Bamborough Castle, Dunstanborough Castle to Alnwick, thence to Warkworth, along the beautiful river Coquet to Rothbury, and over the fells to Morpeth. The distance is about one hundred and eighty miles; accommodation is cheap and good; and there are not five miles of uninteresting country from beginning to end. Northumberland deserves to be better known by south-countrymen; for, apart from its natural beauty, which is not surpassed elsewhere, it abounds, perhaps to a greater extent than any other English county, with antiquarian, historical, and romantic associations; and, quite as great an inducement, it has a character and appearance of its own.

A batch of foreign sketch-books next attracts my attention. One tramp therein delineated I confidently recommend to readers who may be lucky enough to escape the English winter by following the course of the swallows, and that is a walk along the western Riviera from Frejus, in France, to Genoa, passing in order St Raphael, across the Esterel Mountains, to Cannes; thence by Antibes to Nice; thence by the Corniche Road, high up on the mountain-side, to Monte Carlo; thence by the coast-road to Menton; over the frontier to Ventimiglia, through Bordighera

and San Remo, Porto Maurizio, Oneglia, Andorra, Alasio, Albenga, Savona, Pegli, to Genoa. The railway has robbed the road of almost all its old importance; and, over the Italian border, one can generally indulge in a swim, by simply quitting the road, without the chance of being seen by any one. The distance is about one hundred and sixty miles; and by a judicious arrangement of halting-places, no anxiety on the score of accommodation need be entertained, although if, by stress of weather or other causes, the explorer finds himself at nightfall at one of the many little fishing villages, he may be obliged to put up with very rough entertainment.

Another tramp which I took, fresh from the exploration of Hadrian's Wall, in England, was along the ancient Appian Road, as distinguished from the Via Appia Nova, from Rome to Albano. This is hardly to be recommended except to ardent antiquaries, although to them the very stillness and desolation of this once mighty artery of communication, along which the owners of all the great names in Roman history, and many of New Testament history, must have passed, has its peculiar fascination. Beyond the tomb of Cecilia Metella, the usual goal of the tourist, the road is absolutely deserted, and runs, at first deep in dust, and gradually thick-grown with grass, straight as an arrow-flight between mouldering heaps of what once were ornate tombs, over which, by degrees, the grass creeps, until at the railway bridge it is difficult to say if there is a road at all. But if we part the thick grass with our feet, we shall see the splendid stone blocks, still with the ruts of ancient chariot-wheels upon them, as level and as serviceable as when they were first placed in position by the engineers of Appius Claudius Cæcus, three hundred years before Christ. In winter, the walk may be pleasant; but with the sun shining hot, not a square inch of shade and not a drop of water obtainable for nearly sixteen miles, the expedition resolves itself into a conversion of pleasure into toil.

Many another continental tramp is recalled to me as I turn over the pages of more sketch-books: the beautiful walk from Waterloo into Brussels; a fortnight's exploration of Normandy from Rouen to Mont St Michel; tramps along well-beaten Swiss tracks; and wanderings in Sicily, the cradle of pastoral poetry, and the fountain of many of the most beautiful legends of mythology. Then there is a leap of ten thousand miles away to the Land of the Rising Sun. Practically useless as any remarks concerning tramping in Japan may be to the home pedestrian, time annihilates space so rapidly, that at no distant future it may be as possible for a man to spend his long vacation under the shadow of Fusi-yama as by the coast of Wales.

The allusion to Fusi-yama recalls a very memorable expedition I once made on foot with the object of ascending a mountain which at the time I speak of—fourteen years ago—had not been quite robbed of its veil of mystery. Nowadays, every globe-trotter and as many ladies as have the strength make the ascent of Fusi a religious duty. But in the year 1874 it was a very different matter. Treaty limits existed, beyond which no foreigner was supposed to go unless provided with a special pass. No Japanese woman had ever made the ascent of Fusi, for the

very sufficient reason that it was against the law of long centuries; and I believe—but am open to correction—that before 1874 only one European lady, the wife of Sir Harry Parkes, had ever climbed the 'Peerless Mountain.' Armed with what I deemed a valid pass, I started from Yedo on the hundred-mile pilgrimage. All went well as far as Subashiri, the village at the foot of Fusi; and with weary limbs and a light heart I turned in to sleep at an early hour, having taken the precaution to have my pass verified and stamped by the mayor of the place. In the middle of the night, I was awakened, informed that my pass had been reconsidered, and was found to be irregular, and ordered at once to prepare to start back for treaty limits. This I flatly declined to do; but, after a long altercation, was obliged to agree that I would make a start at daybreak. It was very galling and mortifying thus to be rebuffed by the whim of a jack-in-office; but I was a solitary sojourner in a strange land, and resistance would have proved worse than useless. But I had my revenge. When I got up at dawn, I beheld a file of little policemen drawn up in line outside the teahouse. They were in European uniform, and, contrary to their usual habit when on rural duty, wore European boots—stiff, new, untanned English military Blichers, bought probably at a sale, and distributed regardless of fit. I was in good training, and I started, the policemen after me at a trot. I never stopped, not for breakfast, not for rest, until at a distance of eight miles from Subashiri. There was not one of my escort in sight. In an hour's time the sergeant came limping in, with his boots tied round his neck; but I saw nothing of his men. Then my heart softened, and I treated him to wine; but I have never quite got over the fact of having lived years under the sacred mountain and never to have stood on its summit.

Japan in October is the most perfect pedestrian country, for although the high-roads are, or were, as bad as roads can be, there are such innumerable bypaths and tracks, that one is independent of them; and, with the accompaniments of the most exquisite scenery, varied and many-coloured, capital accommodation almost everywhere, and universal courtesy and civility, is comparable to nothing beyond its shores.

I can say that I have walked in China, but except Hong-kong, my experiences are limited to Shanghai and Hankow, two of the most unattractive, nay, even repulsive fields of exertion to the pedestrian imaginable. In Hong-kong there is some good hill-scambling; but the area is so small that the island can hardly be spoken of as a sphere for the pleasure-tramper.

In conclusion, I cannot think of a surer tonic, of a more effectual 'pick-me-up,' for the man who feels the want of a short change of air, or an escape from the groove of his life, when the bats and flannels are stowed away in their winter homes, and the four-oar is snug in the boathouse, than to put on his oldest clothes, sling a satchel over his shoulders—not buckle a knapsack on them—get an inspiration, and start off for a two-days' walk; and he will find, as many men have found who have sneered at walking as unworthy of the cricketer or the boatist, that what he has adopted as a resource will become a habit, and that he need never feel that longing to be 'up

and doing,' without quite knowing what to do, which so frequently makes strong men yawn and stretch during the athletically idle portion of the year.

MIN:

A RAILROAD STORY OF THE FAR WEST.

CHAPTER I.

IN that wondrous modern combination of Babylon and Babel commonly known as the city of Chicago, a city which, like the phoenix, arose from the smouldering ashes of its former self: in that giant gateway and mammoth metropolis of the ever-growing West are many busy streets lined with noble buildings and lofty business blocks. Not the least among the palatial structures, on one of Chicago's most important thoroughfares, is an imposing pile of red stone, upon whose massive portico of polished Aberdeen granite is chiselled the legend—

C. R. M. & P. R. R.

To the ordinary passer-by these large and almost imperishable letters would indicate that the building is, in some way and for some purpose, connected with a railroad. Chicago people are able to tell at a glance *which* railroad; while men interested in railroads, either from necessity or common curiosity, know that upon those six well-furnished floors behind the red-stone front are the general offices of the Chicago Rocky Mountain and Pacific Railroad. They are truly magnificent headquarters, even for an American railroad. The premises would not disgrace a joint-stock mushroom bank or a bubble insurance corporation: they are eminently befitting an important transportation Company. In proof of this assertion of the road's importance, it is only necessary to quote from its own time-cards and newspaper advertisements: 'Linked at Last! The Great Lakes and the Pacific! A continuous ride of 2500 miles without change of cars! Chicago to San Francisco, over the Great Rocky Mountain Railroad, on solid trains of sleeping, parlour, and dining cars! Steel rails and rock ballast! Air brakes and patent couplings! Quick Time—no delays!' If the travelling public are not quite so enthusiastic in their praises of the C. R. M. & P., it can scarcely be the fault of the officials, who do their best to render the road first-class in all its appointments—on paper.

On the second floor of the big red-stone building are the private offices of the chief officials; and upon the ground glass in one of the doors are two words in gold lettering—'General Superintendent.'

One summer morning, perhaps ten years ago, the room into which that door opens was occupied by four persons—all, of course, railroad men. Seated in a revolving chair at a desk was the Superintendent of the C. R. M. & P., a man not more than thirty-five years old. To the right of the great man sat his secretary; and at his left was his telegraph operator, noting with keen eye and ear the ceaseless clicking of the instrument as it throbbed with the pulsations of nearly three thousand miles of wire. A short distance away, and facing the official, stood a man, hat in hand. In appearance he was not unlike the superin-

tendent, except that he was perhaps two or three years younger, and possessed a pleasanter and more open countenance. The official took from a 'pigeon-hole,' endorsed 'Applications for Positions,' a letter, and read it hastily. He looked once from the letter to the man standing in front of him, scrutinising him closely in that momentary glance. 'Your name is Arthur Macpherson?—Yes. You apply for a position as agent or telegraph operator, and state that you are willing to take charge of a quiet office. Your references are satisfactory. I want a man, right off, to go to our station in Western Nebraska known as 44-mile. It is quiet enough—very quiet. I don't want to deceive you: there is no town or settlement near the place. We call it 44-mile for want of a better name, it being forty-four miles west of the nearest station of any account. The salary will be forty dollars a month, besides the use of a furnished room in the station building.—Are you willing to go, and at once?'

'Yes, sir.'

'Very good. You will please start on the express to-night. Wire me when you take charge. I shall be out on the road in a few weeks, and will look in on you.—Dale, fill out a pass for Mr Macpherson.'

Two minutes later the new agent bade 'Good-morning' to Superintendent Ferris, and went his way to work under that official—a thousand miles from headquarters.

The train known as the Pacific Express, which leaves Chicago every night for the Far West, was steaming across the prairies of Nebraska. Those passengers who started from the city on Lake Michigan's shores had been travelling for two nights and a day, and the gray dawn of the second day was slowly giving way to the sunlight as the long string of heavy coaches rumbled over an iron bridge across the Platte River. Then there was a brief stop at the small settlement on the west bank of the Platte dignified by the name of New Constantinople, and again the express rattled on. Nearly two hours later the train once more slowed up, and the conductor tapped upon the shoulder a man who was dozing on one of the seats in the smoking car. The conductor was a big jolly sort of fellow. '44-mile!—So you're the new agent? Well, it's taken just five weeks to drive the fellow crazy who is leaving. I go through the darned hole every other day on my run. Never seen a blamed cuss round that there 44-mile cabin 'cept the agent, since this here road started up, more'n three years ago. Ratty Sykes, who quits to-morrow, told me, day before yesterday, that barrin' the two trains as go through every morning, he hain't spoke to a soul in five weeks, an' he's 'bout sick of it.—Your name's Macpherson—see that by your pass. Well, I'll tip the time o' day to you as often as anybody, I reckon. Hope you'll stand it pretty well, Mac, my boy.—44-mile!'

The name of the place the conductor shouted from force of habit: he knew full well there were no passengers for that wild spot in the wilderness, so it did not much matter that what he said sounded very like 'For-for-my.' This conductor was one of those enviable men who can take life comfortably and smoothly. Of course, being an American railroad conductor, he

was an important personage; hence his familiarity with Macpherson on short acquaintance was quite excusable—indeed, it showed much good-will, not to say condescension, on the part of the conductor.

When the train came to a stand-still, Arthur Macpherson swung himself off the rear platform of the rear car, while the baggage-master roughly tossed his modest trunk from the baggage car into the long coarse grass at the side of the track.

If you, reader, have never travelled beyond the confines of Great Britain, where great railways always boast of an 'up' and a 'down' line; where city stations are generally well appointed and oftentimes palatial; where country way-stations are often prim and picturesque and generally neat and tidy; where passengers step from the cars to conveniently raised platforms; where the road-bed is neatly enclosed on both sides by hedgerows and fences, and where roads are crossed by bridges, or at least are guarded by gates—if you have never journeyed in the Far West of the great American continent, you will find it difficult to imagine the stern reality of a wild *unfinished* railroad. It's O for Yankee cars!—but alas for Western 'depots!' You can travel in a palace, but buy your ticket and wait for the train in a hut or under the 'blue vault.'

Macpherson had travelled much: he had been a railroad man, on and off, ever since he left school; but this was the first time in his life that he had felt bewildered by a sense of utter loneliness and isolation. Leaving his trunk to take care of itself in the long grass whither the gentle baggage-man had tossed it, he stood with his hands in his pockets in the middle of the single weed-grown track and watched the train as it gradually faded into the distance. There was nothing to intercept his vision, and it was nearly fifteen minutes before the express appeared to be an infinitesimal speck which finally blended with the western horizon. Then he turned slowly about. He faced the south, the east, and the north by turns: there was no difference. It was apparently boundless prairie, a seemingly interminable stretch of coarse grass and sage brush, spanned by the single track of the railroad like a narrow iron ribbon; with not a vestige of a tree, a house, a barn, or a living soul to relieve the intense monotony of the scene. In every direction he could see as far as where, on the distant horizon, the sky blended with the prairie.

So intent was Macpherson upon trying to discover somebody or something which he might consider neighbourly, or so enrapt was he in his own thoughts, that he failed to notice the station itself. He was awakened from his reverie by a harsh voice.

'Ah, there, stranger! Kinder think yo'd struck the wrong place.'

Turning quickly, he beheld a tall lank figure, with unshaven face and long hair, clad in a red flannel shirt, a big slouchy hat, and blue jean pantaloons—the end of the last-named garment being tucked away in heavy top boots sadly in need of blacking. This very crude specimen of a man, still young, was standing in the doorway of a one-story frame shanty about fifteen feet by ten, set half-a-dozen yards to the north of the track. The solitary telegraph wire, which was

carried across the plains on rough posts much shorter than telegraph posts usually are, made a dip near the cabin, to the roof of which it was fastened by a couple of insulators. This fact, and a small white board on which was painted in black letters, 'C. 1008, S. 1450' (the distance in miles from Chicago and Sacramento respectively), satisfied Macpherson that he was undoubtedly at 44-mile station; so he replied: 'No, there's no mistake. I was merely trying to think if I had ever seen a more God-forsaken spot.—I suppose you're the man I've come to relieve?'

'Ararat (call it Ratty) Sykes, agent an' operator, 44-mile, Nebraska!—I'm thet same man, pardner. By thunder, yo're jest right 'bout this consarned hole! I'm told it's the lonesomest place on the road 'twixt Chicagy an' Frisco. Lonesome ain't no word fur it. I ain't seen a blessed soul, not even a tramp, round these yere diggins sence I came here five weeks ago. 'Nuther week 'ud hev sent me clean daft. Fair an' squar', I think a couple uv days more 'ud hev seen me a-jumpin' underneath a freight-train, to raise my sperrits an' a leetle excitement. Dunno how yo're goin' ter stan' it, fur yer look like a city rooster. I know it's mortal mean; but I'm so eternally glad to git away myself, I can't feel half as sorry fur yer as I'd orter. Let's git yore baggage inside.' As they tackled Macpherson's trunk between them, the outgoing agent continued: 'Yer see, I'd orter be used ter this yer sort o' thing. My home's up ther ter Constantinople, which, as yer may know, ain't any great shakes uv a city. Was born on the plains afore iver ther was a railroad—never been east uv Omaha. Got tired o' chasin' cattle, an' learned telegraphin' 'bout a year ago; but ef I can't git a better show at a job than agent at 44-mile, I'm a-goin' back ter cattle-raisin'.—No, ther ain't very much to do here, thet's the worst uv it. A feller has got ter hang over the ticker from 2 A.M. to six P.M., jest *in case* he's wanted. Ther's no reg'lar trains passes here after six in the evenin' 'til the flyer fur the east goes by at two in the mornin'. She passes the Pacific Express (thet's the train yer jest got off) at Constantinople. Them's the only passengers. Ther's four reg'lar freights durin' the day; sometimes they stops fur telegraph orders, mostly they don't. Ther's a switch [siding], as yer see, but it's niver been used sence I've been here.'

By this time they had entered 'the depot,' which Macpherson proceeded to investigate. The 'office' in which Macpherson found himself was a rather shabby room about ten feet square, its only recommendation being that it was well lighted. There was a window to the south, facing the track, and windows looking east and west. Underneath the south window was a rough table, upon which stood a telegraph instrument, which clicked and rattled incessantly. Before the table was a wooden chair of the kitchen furniture species; and seated in that chair, with his hand on the 'ticker,' the operator could, from the windows to his right and left, see any trains which might be approaching.

It should be understood that, the railroad being a single track used by trains going in both directions, much telegraphing was necessary to ensure the safe running of the trains. Indeed, it was merely for telegraphic purposes that the

station at 44-mile was maintained, and nearly all trains stopped for 'orders,' as a precautionary measure, though only on special occasions were trains held on the switch. Most of the 'passing' took place at New Constantinople. There was a large railroad clock over the south window; and back by the wall was a small cook-stove, rather dilapidated, and decidedly greasy.

'Yo'll hev ter cook fur yerself, pard, when yo've got anythin' ter cook. Howiver, they're pretty good up ter 'Stan'ople fur thet. Jest wire yore order ter the operator up ther; an' it'll mostly come by next train. Yer settle with 'em pay-day, which don't travel this way very often. I'm a pretty good cook myself by this time; had lots uv chance ter practyse.'

A very small combination china closet and pantry completed the furniture proper, though hanging on one side of the room was a map of the C. R. M. & P. Railroad; while on the other wall were suspended two or three coloured lanterns and some dirty train-flags. Passing through a doorway, quite innocent of anything like a door, Macpherson tried to gain access to the 'furnished room' which the superintendent had spoken to him about. It was indeed furnished—with an old-fashioned truckle-bed; but, as the bed was about four feet six inches wide and the room only five feet deep, by the time Macpherson's shins struck the bed-side at the first step forward, his curiosity in that direction was speedily satisfied. There was no window to the 'furnished room.'

'The be-ewty of this yere place is, yo've mostly got plenty o' good spring water, right handy fur washin' an' fur drinkin';' and as he spoke, Ratty Sykes led the way to the spring, a short distance up the switch.

The first day passed pretty well for the new agent. After learning his duties in detail, Mac passed the time in conversation with Ratty, which was a godsend to the forlorn Constantinopolitan, while Mac was much amused with the Western's original style. At two A.M. next morning, Ratty Sykes bade Macpherson 'farewell,' and boarded the east-bound train, carrying with him a cash order for Sunday supplies.

The second day waned slowly enough for Macpherson; but on the third morning came a supply of boards, carpenter's tools, paint, an easy-chair, and a new rigout of cooking utensils, to say nothing of a variety of stores in the way of edibles and drinkables.

'I've made up my mind that the best thing for me to do is to live alone; but that is no reason why I should not be as comfortable as circumstances will permit. Anyway, the depot may as well be sweet, clean, and weatherproof.'

So, for the next few days the new agent was busy enough repairing and painting the shanty inside and out. He also used a broom and scrubbing-brush to good purpose, until all trace of the genus Sykes and predecessors was washed or painted out. And when all this was done, and the easy-chair placed in the 'office,' while a few really good books filled a shelf which Mac fixed up, the place did not look 'half-bad,' as he himself expressed it.

Yes, it was a very queer thing for a man like Arthur Macpherson—a man who, although not a scholar or of 'blue blood,' was evidently well educated and refined—to bury himself in an

out-of-the-way telegraph cabin on the plains. He doubtless had reasons, which to himself were satisfactory, and at anyrate the fact remains that he was now agent and operator at 44-mile, where he proposed to stay. He was a conscientious man, this Macpherson, and applied himself to his duties just as faithfully as if he had been in charge of an important junction with a dozen clerks under him; but still he had many hours each day with 'nothing to do.' He got plenty of old newspapers from the trainmen, and he occasionally added a new book to his little library. He read much and thought more, but the time often wore away very slowly.

LIGHTHOUSE LAMPS.

SHELLEY says, 'Men scarcely know how beautiful fire is;' yet fire and light have always been invested with celestial attributes, and lamp festivals have been common to all nations. Various expedients have been used for chasing away darkness—torches, flambeaux, links, lamps, and candles being among the number. Flambeaux and links have disappeared; the torch still lingers among the Lapps, to lighten the gloom of arctic winters; while no small ingenuity has been expended in bringing lamps and candles, suitable for domestic purposes, to their present state of development.

From the earliest times, fire has been used as a signal or as a sign of rejoicing; but at what period it was brought into play, on the low shores of Egypt, as a guide to the sailor, is unknown. From the pitch-pot hung on a pole, or the fire blazing in a chauffer, to the electric arc lamp with its power of twelve thousand candles, is a long step; and this represents the efforts of lighthouse engineers for two thousand years to devise the best light to guide the mariner during the darkness of the night to the haven where he would be. Now, what are some of the steps through which lighthouse illumination has passed to bring it to its present state of perfection? As is well known, the earliest lighthouses showed the uncertain light given by burning billets of wood or coal in an open grate; and such lighthouses existed in Scotland till 1816, in England till 1822, and at the Baltic till 1846. These lights continually varied in appearance, now shooting up in flame, or giving out dense volumes of smoke, according to the ever-changing moods of the weather; and often, in the sailor's greatest need, the flames were blown away from him, the fire often kindling only on the leeward side. The huge bonfires required three men to attend them, and were not only expensive to maintain—some of them consuming four hundred tons of coal yearly—but were liable to be mistaken for lights on shore, wrecks happening in consequence. The first improvement was made when the fire was partially enclosed, a glazed frame being placed in front; but this gave rise to the use of bellows to keep the bonfire ablaze, the attendants being exposed to all the changes of the weather.

Lamps were long used for domestic purposes before they found their way into coast illumination. The best domestic lamps, however, had torch-like wicks made of a skein of cotton; and if they did not give much light, evolved plenty of smoke; it being the duty of a slave in olden days to go round the rooms in the morning to

wipe off soot left on pictures and statues. Oil was used for lighthouse purposes at the end of the sixteenth century; but liquid fuel often gave way to candles of tallow or wax, and this led to their adoption in coast illumination. Smeaton's famous tower on the Eddystone rock was crowned with twenty-four tallow-candles, five of them weighing two pounds. The candles needed snuffing every half-hour; and it was when the keepers of Rudyerd's lighthouse went to do this, that they found the lantern in flames; and in a short time, the tower, which was mainly of timber, met with a fate from which its position seemed exempt—destruction rapid and complete by fire. It was at the same lighthouse that the keepers, after a long spell of bad weather, when no provisions could be landed, were reduced to the necessity of eating the candles. The feeble glimmer of these candle-illuminated lighthouses could only be of use to vessels creeping along the coast, and would ill meet the requirements of modern steam-navigation, when passages need to be made with almost the regularity of train-service on land.

Almost every kind of oil has been used as fuel in lighthouse lamps. Ordinary whale-oil was burned in lamps having wicks made of a hank of cotton, such as were common until the days of paraffin in the poorest fisherman's cottage. Spermi-oil began to be used about the end of last century, and was continued till about forty years ago, when it was supplemented by colza, which had decided advantages over sperm: its intensity was slightly greater; it remained fluid at a temperature when sperm thickened; its flame was steadier, causing fewer breakages of the glasses; and above all, it was only half the cost. Olive oil is still the fuel in many lighthouses; but it does not give good results in burners having concentric (one within the other) wicks. In Indian lights, cocoa-nut oil is used for all orders of lamps with satisfactory results. So far as British lighthouses are concerned, paraffin has supplanted all other oils, as, when burned in the Doty and other lamps, it has very great advantages over colza: its flame has more luminous intensity, the lamps are easily managed, and the cost is only about a sixth that of colza. The saving by its use in the Scottish coast lighthouses is upwards of three thousand pounds yearly.

Many are the modifications which have been gradually introduced in lighthouse burners, from the tin lamp with two or more spouts, each with a skein of cotton, to the large concentric-wick lamps having from three to eight wicks. The flat-wick burner, though an advance on the hank of cotton, did not give good results; and it was not until towards the end of last century, when Teulère and Argand devised the cylindrical wick-burner, which admitted a current of air inside the flame, and secured more perfect combustion, that lamps were made suitable for lighthouses. Accustomed as we now are to lamps on the Argand principle, we can scarcely realise the distinct advance towards perfect combustion which was then made; and the simple accidental placing of the broken neck of a flask over the flame led to Argand's burner being brought nearly to a state of perfection. Teulère combined the cylindrical wick-burner with reflectors of an improved form; and this led to the use of perfectly formed reflectors of silvered copper in lighthouses;

and they still exist in some of the best coast-lights, the only difference being, that with paraffin the initial power has been raised from twelve to twenty-three candles; and as each reflector sends forth a sheaf of rays equal to three hundred and fifty times the unassisted flame, when there are, as in some towers, twenty-four reflectors, the resulting beam is one of great power. The cost of the paraffin for such a lighthouse is only about thirty-six pounds a year, while, if colza were used, it would be six times that amount.

Argand burners about one inch in diameter are well suited for reflectors; but when Fresnel solved the problem of using lenses for light-houses, it was necessary to have a central flame of great power. Taking advantage of Rumford's idea of having a burner composed of concentric wicks, Fresnel and Arago set to work to devise a lamp which would give a pure and intense flame; and they succeeded in constructing a burner having four concentric wicks, the inner being one inch, and the outer about three and a half inches in diameter. In addition to the glass chimney, which is contracted at a certain height above the top of the burner, so as to project a current of air against the flame, there is a metal chimney, into which the upper end of the lamp-glass enters. This increases the draught and whitens the flame, which is equal to two hundred and sixty standard candles with colza oil, the size of the flame being about three and a half inches in breadth by four inches in height. This powerful flame developed great heat; and Carcel's device was resorted to, of causing a flow of oil over the burner, to keep it cool, the surplus running back into the cistern. Without this overflow, the wicks would soon be charred and the burner destroyed. With paraffin as the fuel, the fluid is not allowed to rise beyond a certain height in the wick cases. The introduction of paraffin as an illuminant in lighthouses has led to an increase in the size of the burners, which, on the score of expense, was scarcely admissible when sperm or colza oil was the fuel. The flames developed in the paraffin burners vary in power from twenty-three candles in the single-wick to over nine hundred candles in the seven-wick concentric lamp. Such powerful flames were unknown a few years ago; and the limit to the increase in size depends on the apparatus, which cannot be much enlarged without increasing the size of the towers and lanterns.

Gas was used for lighthouses about seventy years ago; and for harbour lights it has been very largely employed with satisfactory results, either in ordinary jets or in Argand burners. Mr Wigham of Dublin devised gas-burners some years ago, and has persistently advocated their use, combined with apparatus arranged in biform, triform, or quadriform—that is, the central parts of dioptric apparatus placed one above the other; these burners have rings of jets varying from twenty-eight to one hundred and eight in number, the diameter of the rings varying from four to eleven and a half inches; and the power of the flames varies from two hundred and fifty to two thousand three hundred standard candles. In Ireland, eight lighthouses use gas; in England, one; and Scotland has one—Ailsa Craig—in which gas made from paraffin is employed.

A very useful application of gas for beacons

and buoys is the compressed mineral oil-gas of Pintsch, so successfully used at the Clyde, at the entrance to the Thames, the Mersey, Suez Canal, and other places. The gas is made from crude paraffin, and has a high illuminating power (forty-five candles), and it costs from eight to eleven shillings a thousand feet, which is considerably more expensive than coal-gas; but it is more suitable for compression. The gas is compressed into holders at a pressure of one hundred and fifty pounds on the square inch, and taken to charge the buoys. The light on the buoys burns continuously night and day till the gas is exhausted; and its burning is controlled by an automatic regulator, and the flame is protected by a lantern and small dioptric apparatus. The Pintsch system is certain to be further extended, not only for coast illumination, but specially in rivers and estuaries, whereby beacons and buoys will be made as useful by night as they are by day.

The most intense light yet used for light-houses is the electric arc lamp, the current being generated by De Meriten's alternate-current magneto-electric machines, driven by powerful engines; the initial power of the arc with carbons an inch and a half diameter being twelve thousand candles. But as the cost of providing the necessary apparatus and maintaining the light is great, electricity has only been used at a few stations in England and France; and the Isle of May is the only example in Scotland. (The beam of light shown to the mariners from the Isle of May lighthouse is equal to about three million candles, or three hundred times more intense than that of the old oil-light.) The French government contemplate an expenditure of two hundred and eighty thousand pounds, spread over a period of ten years, principally in installing electric lights; and this work has already been begun. For important landfalls made by oversea vessels, the electric light, owing to its expanse, is alone admissible. For all the purposes of the sailor, the intense beams shown from first-order lighthouses are probably sufficient, as even the electric light is quenched during dense fog, and it becomes a question when light must give way to sound. Although it has been proved beyond question that the electric light has the greatest penetrative power in fog, no light which man is likely to devise will be able to pierce very dense fog, as the sun itself then ceases to be visible. Sound-signals are gradually being introduced at salient points of the coast, and the difficulty in extending them is mainly one of finance.

THE CRUISE OF THE *PUNJAUB*.

THE Honourable East India Company's war-steamer *Punjaub* lay idly at her moorings in the port of Aden. Aden is always a hot place, but on this particular afternoon the heat was intense, to a degree surpassing the experience of the most seasoned hands on board. The sun's perpendicular rays not only 'illuminated the depths of the sea,' but actually liquefied the pitch in the seams of the deck in spite of the awning. If it was hot on deck, it was unbearable below, and nearly all the

officers were to be seen lounging about, leaning over the bulwarks and longing for the evening breeze. Those of the European sailors who were not on liberty ashore followed the example of their superiors; while the native marines and the Lascar portion of the crew idly disported themselves in the very airiest of undress costumes. Even the Somali firemen and stokers, usually supposed to be as impervious to heat as so many salamanders, did not seem much inclined for exertion, and smoked their gurgling hubbubbles with an air of resignation rather than enjoyment. Any stranger boarding the *Punjaub* might have thought she was manned fore and aft by lotus-eaters. But a seaman, glancing either at the crew or the vessel, would have come to a different conclusion. The snowy whiteness of the decks, the glittering arms in the racks, the carefully bronzed guns, the manner in which every visible bit of metal was polished to the highest possible pitch of brightness, and the indescribable air of tautness and trimness which pervaded the whole ship, showed her to be not only a man-of-war, but one on board which strict discipline was kept.

The *Punjaub* was one of the cruisers of the Indian navy, kept up by the Company for the suppression of piracy and to check the slave-trade. She was a fine vessel of her class, four hundred and fifty tons burden, teak-built and copper-bottomed, a paddle steamer, two-masted, and rigged as a fore-and-aft schooner. She carried six long eighteens of a side, had a thirty-two-pound stern-chaser, and a nine-pounder swivel on her fore-castle. In addition to her complement of officers, who were all English gentlemen, she had a crew of thirty-six British blue-jackets, forty of the best Lascars to be found in Bombay, and fifty native marines. Suddenly, a midshipman tripped up to the officer of the watch, touched his cap, and reported: 'Captain's gig coming off, sir.' The lieutenant, looking shorewards, saw the gig, gave the necessary orders; the side was piped; and Captain Frank Dallas, commanding the *Punjaub*, came on board, the marine guard presenting arms as he passed the gangway. The captain, a portly bronzed gentleman of about forty, returning the salute of his officers, said briefly: 'Sailing orders for to-morrow, gentlemen,' and made a sign to the first-lieutenant to follow him to his cabin.

'Look here, Brownson,' he said when they were both seated. 'I have just received orders to cruise in the direction of Zanzibar to try and intercept five large Arab dhows laden with slaves, which, from information which has reached the Bombay government and been forwarded here, are about to try and land their cargo at that place. Moreover, I am to keep a lookout for a suspicious barque which sometimes shows Portuguese colours, and at others flies the stars and stripes. She is supposed to have no right to either. It is known that she has made a raid on the territory of our ally the Imaum of Muscat and kidnapped some of his people. In fact, the government have good grounds for believing her to be not only mixed up in the "black-ivory" trade, but to be nothing short of a pirate. She is said to be heavily armed; but

I daresay we shall give a good account of her if we meet. You will oblige me by sending a party on shore at gun-fire to collect such of the liberty-men as may not come on board to-night. You will say nothing, even to the officers, of our destination till we are out of port. We get under way at eleven A.M.'

'Sailing orders!' was the cry joyfully repeated throughout the ship. All hands were delighted. To be sure they did not know where they were going, but they knew they were leaving Aden, and that knowledge alone was sufficient to cause delight. All were on board early next morning, and at the appointed hour the steamer slipped her cable and put to sea. The vessel's destination was then made known, the captain's only object in keeping it secret having been to prevent its being in any way divulged on shore, as the slave-traders had mysterious ways of obtaining information, and kept correspondents and spies in every port.

The steamer was not many days in arriving at her cruising-ground, when the captain ordered the fires to be kept as low as possible without extinction, in order to show so little smoke as to be almost invisible at a distance, while everything was kept in readiness to get up steam at a moment's notice. One evening, just before sunset, the dhows were descried from the top by a lynx-eyed Lascar lookout-man. The captain, trusting to the darkness of the night, took measures to cut them off from the land. These dhows are large three-masted vessels, lateen-rigged, and besides the space allowed for the slaves, who are bundled together in a manner too shocking for description, have ample room for a crew of some eighty men each, and all armed to the teeth. The dhows carried guns; and their Arab crews, when they could not get away, fought as desperately as men will fight under the influence of two of the most powerful incentives to human action—avarice and fanaticism.

When the first glimmer of dawn broke, the *Punjaub* was within half a mile of the slave fleet, and between them and the shore, which was about two miles off. The slavers had seen the steamer but indistinctly; and as the guns and hammock-nettings had been carefully covered with tarpaulins, and she carried no pennant or showed any bunting but the 'jack,' they had taken her for a passenger steamer. They were quite taken by surprise when the Company's ensign, with its rampant lion, ran up to the masthead, the drum beat to quarters, and in an instant they beheld decks cleared for action, the guns manned, and the marines under arms, while Captain Dallas through his trumpet hailed the foremost from the bridge with: 'What dhow is that? Where from, and where bound? Heave to, or I'll sink you!'

The foremost dhow struck her sails, and the Reis or Arab skipper invited the captain to send a boat on board; but he was too wary a hand. His experienced eye had noticed the crowds of men on board her, though they concealed themselves to the best of their ability. Captain Dallas had heard of cold shot being thrown into boats as they ran alongside, and had no intention of having one of his stove in and risking the lives of her crew. He ordered his starboard broadside to be brought to bear, and directing his men to fire at the

rigging, so as not to injure the wretched slaves, he gave the word to fire, and had the satisfaction of seeing the dhow's foremast go by the board. The slavers now threw off their mask, and answered with four long guns, which killed one sailor and wounded three of the Bombay marines.

The other dhows rapidly closed in, with the intention of encircling the *Punjaub*, each opening fire as it came within range. The cruiser, however, now had her steam up; and by skilful handling of his vessel and good gunnery, Captain Dallas managed to inflict sufficient damage on the rigging of each of the slavers as effectually to prevent their getting away until he should be able, instead of risking his boats, to get alongside each in turn, compel it to surrender, and free the slaves. Indeed, he was not a little surprised at their showing fight at all, as it was unusual for craft of that class to do so if they could possibly help it. By separating, most of them at least could have got away in different directions.

The mystery, however, was soon to be solved, for a large barque shot from behind a headland of the coast. Telescopic examination instantly showed that she answered the description of the vessel they were to search for, that she flew the Portuguese flag, carried far too many men for any peaceful trader, and was indeed more heavily armed than the *Punjaub*. She meant fighting, too, for, as she approached, the Portuguese ensign was lowered and the hideous black flag was run up, revealing her true character. Captain Dallas at once left the crippled dhows, knowing they could not repair damages and get away for some time, and moved to meet his new antagonist. The ship's company, sailors, Lascars, and native marines, mustered after their several manners as they neared the foe. The pirates fired a broadside as they approached, but too high, the only great damage done being to the funnel, about a foot and a half of which was shot away. The *Punjaub* returned the fire with more effect, the eighteen-pounders sending their shot crashing through the enemy's bulwarks, the splinters of which made fearful havoc on her crowded decks; while one from the thirty-two-pound chaser, which had been slewed round so as to bring it to bear, tore right through the stern cabin, knocking two of her ports into one.

As the vessels closed, broadside after broadside was exchanged; and Captain Dallas, seeing that her metal was heavy, determined on boarding. The *Punjaub* steered close alongside the barque, and having grappled her, the first-lieutenant, with two-thirds of the seamen and marines, boarded. On reaching her decks they met with determined opposition from about as fierce a set of desperadoes as were ever banded together for purposes of crime. Renegade Portuguese, savage Malays, lithe, cruel-looking Manila men, and Chinese, all alike fought desperately, for they knew that they fought with halters round their necks. But they fought in vain. No men ever yet could stand against British sailors at sea. The Lascars emulated the valour of their shipmates; and as for the men of the Bombay Marine Battalion, they were sepoys—that is as much as to say they behaved as well as their European *compagnons* could. Steady courage and perfect discipline prevailed over mere desperation; and in spite of the wolfish ferocity with which they struggled,

the motley crew of the pirate began to give way before the cruiser's people. Their captain was cut down by Mr Brownson, the first-lieutenant; and his men dropped fast before the volleys of the marines; while the cutlasses and boarding-pikes of the seamen and Lascars did deadly work. Part of the pirate crew ran below, where a couple of their own guns, loaded with grape and pointed down the hatchways, soon compelled them to surrender. The remainder barricaded themselves in the forecabin, but a few volleys reduced them also to submission. Mr Brownson, having overcome the resistance of the pirates, was about to haul down the black flag, when a signal from Captain Dallas warned him not to do so, but to get his prisoners into irons without delay.

One by one they were brought up, shackled, and made to lie down. The reason of the captain's order was soon obvious. The Arab dhows, though disabled for sailing, had got out long sweeps, and were coming to the assistance of the barque. As they did so, the cruiser was cast loose from her late opponent, and yawing, so as to get a chance with her long gun, raked the nearest from stem to stern with grape. Great was the slaughter and greater still the consternation, especially when the slavers saw the black flag fall to the deck of their ally and the British Union-jack hoisted in its place. They shouted 'Amaun! Amaun!' and waved their turbans in token of submission. The steamer cruised alongside each in turn, and allowed the slaver crews to come on board, having first dropped their arms. They were then ironed and placed in rows on the deck under a guard of marines. The barque was searched throughout, and ample evidence of her character found. The fettered pirates were placed in safe confinement; a prize crew, under a lieutenant, was put on board, with orders for her to be got under way to accompany the *Punjaub*; the dead of both vessels were committed to the deep, and the wounded to the care of the surgeon and his assistants. Then came the work of liberating the slaves and transferring them to the hold of the barque—a tedious and disgusting business, and dangerous withal, as many of the poor creatures were frantic from confinement and want of water, in a horrible state of filth, and so infuriated by their sufferings that they knew not friend from foe. All was, however, at last accomplished; and taking the dhows in tow, the *Punjaub* steamed into Zanzibar, where the slaver crews were landed at their own request, the slave-trade not being treated as piracy, although it ought to be. She then put back to Aden, where the dhows were condemned as lawful prizes, and sold by public auction. The same fate awaited the barque on arrival at Bombay, where they next proceeded, the slaves being liberated and sent back to Africa. The pirates were duly tried, condemned, and executed.

Thus was the sea freed from a pest and a heavy blow struck at the Zanzibar slave-trade. Captain Dallas received the thanks of the East India Company, and his gallant ship's company soon had their pockets full of bright rupees from their prize-money. It is now many years since the date of these captures; the Indian navy is a thing of the past, and its services even then were but little heard of in England; but many daring exploits were performed under the Company's

flag, and many old sailors can still well remember adventures very similar to those which occurred during the cruise of the *Punjab* in the bygone days of 'John Company.'

SYMPATHY WITH SHOP-GIRLS.

BY ONE OF THEM.

THE experiences of shop-girls are varied: there are those who simply take ease and never allow business to worry them; such get through a year or two of service without having a care beyond punctuality. The best saleswoman, however, is the one who has been trained to the business from an early age, an apprenticeship of four years being the period considered necessary to learn. The result depends greatly on the girl's capacity and eagerness to rise to a high place, and in the regularity with which she applies herself.

My experience is common, but may encourage those who are unacquainted with the way in which many shop-girls begin. The warehousemen of the prosperous town in Scotland where I began my business life are rising men; they like to conduct their establishments in a thoroughly systematic style. The staff must be large all the year round. In order to keep up the number, three or four junior assistants are put behind the counter every year. Though young, smartness of appearance is greatly studied, and good manners and tact are indispensable. Very small salaries are given by way of encouragement.

With the view of being trained for a saleswoman, I applied in answer to the advertisement for a 'Smart Message Girl.' Few persons know how interesting that announcement is to thirty or forty girls just old enough to work and anxious to get a beginning in a respectable shop. Having the advantage of a kind friend to use her influence, I was the successful applicant. Then began my business life. Two years' drudgery, carrying parcels, delivering circulars, accounts, &c.; out in all kinds of weather; yet very happy. No responsibility, the heart keeps light.

Then came the time for promotion: the choice of three departments—dressmaking, millinery, or the counter. Rather doubtful of my abilities, I timidly said the last-named. By way of preparation for it, or with the intention of seeing the capabilities of the future saleswoman, the firm approved of putting me—as they had done many others—into the cash-desk—to give out change, count the cash, and attend to all the ready-money transactions. A competent book-keeper being kept, I had comparatively little charge. In this position I spent two happy years. My next step was with the prospect of being initiated into the way of speaking to the public over the counter, keeping the stock, and packing parcels—the last being the lively duty allotted to me, along with dusting and waiting on a senior hand. To my idea then, a year spent in this fashion was not edifying. Dusting, packing, bringing things from other departments—which was my sole occupation from morning till night—was monotonous in the extreme. I had no interest in such menial employment. Fortunately, a slight change gave

me the benefit of a rise—a branch department, under the supervision of an experienced hand. I had more congenial work, although not entire charge. Dressing counters—under instructions—and occasionally serving customers, I seemed now on the road to fortune.

To have charge of a large department, where I might earn the confidence of customers in my acquired knowledge, at the same time to gain my employers' respect in so far that they would value my opinion in selecting goods for my own department—such had been the height of my ambition. Truth to tell, I was down-hearted many a day.

From the assistantship I was promoted to a department under my own charge. The responsibility was little compared with that to which I was next advanced, the latter being what is known in this line of business as the 'Ladies' Outfitting.' It was very extensive, and in many ways quite new to me. When I was offered it, I frankly said I had no desire to take it, but would try my best for a month. I got a few assistants. I had also the much envied honour of buying my own stock, &c. I put my whole heart and energies into it; and at the month's end I preferred this to any other department in the warehouse. Having passed through these stages, I reaped the benefit of being kept down at first. Drudgery is often the forerunner of success.

Though now far removed from the scene which I have attempted to describe, it is with pleasure that I recall many incidents, the sunshine of friendship and co-operation being very bright in my memory. Many young ladies at home have little or no sympathy with the 'common shop-girls,' as they often term them. When they do so, they forget that to stand ten hours a day, having to appear pleasant no matter how fidgety the purchaser may be, does not always come naturally to those behind the counter. In many cases they are girls suited to a higher sphere, but, through force of circumstances, have been obliged to go early into the world. Many of these shop-girls have attended private classes for self-improvement, so that they may acquire themselves properly should fortune favour them with a step higher in life. Consideration is a thing they seldom get either from the public or their employers. Allowing that he is a model employer, he is very careful of his own interest, and can afford to be pleasant when business is brisk and all the tedious demands of his lady-customers absorb the attention of his assistants. But there are some months when pleasant actions would be more effectual than words—say, from January till the end of April. Few of the shops in the north of Scotland are sufficiently heated for the cold weather and easterly winds which are keenly felt there. Many of the shop-assistants suffer from the bad effects of chills, which while standing at their posts are unavoidable. A draught is more injurious than open air. A comfortable dressing-room, with a fire lighted in wintry weather, would be a great boon to shop-girls, where they could change wet boots and get themselves warmed properly. No conscientious and sensible young lady would take advantage of her employer's generosity, were he to supply this much needed want. Chairs they have got, but I

fear have seldom the pleasure of sitting on them without the dread of being found fault with.

As a class, I admire and feel for them, and would suggest that some of the lady-customers might not assume such an overbearing and austere air when they visit a draper's shop. The trouble of the saleswoman is only her duty certainly, but a smile and word of thanks is never lost; in some harassing moments, a gentle kindly word would give fresh vigour to the weary shop-girl.

CRAW-FISHING.

ONE of the least generally known, but by no means the least interesting or exciting forms of fishing is that of cray-fishing, or as it is generally called in the country-places where this sport is indulged in, craw-fishing. The fresh-water lobster or crustacean, known to naturalists as *Astacus fluviatilis*, is a delicate little crustacean sometimes offered for sale in the London West End fishmongers' shops; but in spite of its abundance in many places, and its use as a tooth-some morsel, it is little known. The crayfish frequents English brook and streams in limestone localities where beds of clay occur; in such places the watercourses cut deep channels through the fields and meadows, winding about in the most romantic way; and as they are often overhung here and there with hawthorn and bramble, these tiny ravines are really lovely in themselves. Along the bottom runs the brook—deep and silent here, shallow and babbling there, where it rushes and swirls over a stony bed. The banks are pierced in many places with the holes of the water-rat and the crayfish, for the fresh-water lobster retires to these holes in the winter, though in the summer he seeks the shelter of the stones in the bed of the stream. In the autumn, before the brooks are swollen with the rains of winter, and when these crustaceans are in their prime, then is the time for craw-fishing; and those who have enjoyed a good evening's sport, when the autumn moon is rising, and the crisp cool air adds vigour to one's frame, are not likely soon to forget the pleasure of it.

It was just such an evening as this when we started off on our first craw-fishing expedition. We were well loaded, for we had made up our minds for a big haul, as the evening was a good one, and we knew that the 'fish' were on the run, or, in other words, feeding; so we had two dozen nets with us. As these nets are rather peculiar, a description of them may be interesting. A small iron hoop about a foot in diameter is used, and on to this is loosely stretched a small net of rather fine mesh; in the centre is a piece of string for fastening the bait. Four strings are fixed to the iron hoop, and these are joined together about three or four feet above the net; and to this, again, some twelve feet of stout line. As the iron hoop is a heavy one, in order to sink rapidly, a couple of dozen of such nets are a good weight to carry. Our bait consisted of two or three pounds of bullock's liver, which is the killing bait for crawfish, probably because they seldom get it in the natural course of things; as boiled shrimps are the favourite food of some of our fresh-water fishes, and as salmon are partial to feathers and gilt wire because they are something unlike what they ever saw before. A large

basket for our spoil, and our pipes and tobacco, completed the necessary apparatus for the evening's sport, not forgetting, however, a newspaper, the use of which will be seen.

The stretch of brook we intended to fish was a delightfully winding piece about a quarter of a mile in length, with a good stony bottom, such as crawfish love. The sun was just setting as we commenced operations, which consisted in baiting the nets by tying on a small piece of the liver as firmly as possible. When all the nets were baited, they were lowered into the middle of the stream, using a forked stick, cut from a neighbouring hedge, over which to run the string and get the nets well out from the bank. A small piece of the newspaper pegged to the ground marked the end of the string. The nets having been lowered in this way at every likely spot, but not nearer together than twenty or thirty feet, we enjoy a quiet pipe, and wait to let the crawfish have time to get well on the nets, though, when they are strongly on the feed, they may be seen to attack the bait as soon as it touches bottom. It is now almost dark, and were it not for the bits of paper, the nets would be quite impossible to find. As we go to the first one and haul it, we see that it is evidently going to be a good night for sport; for, in spite of two or three splashes in the water, showing that some of the crawfish have slipped off the net, we land nine fine ones; and so on all down the brook, sometimes more, sometimes less, but no empty nets. We are now busy; for as soon as the line of nets is hauled and put down, it is time to begin at the top end again. But suddenly there is a break; the fish have ceased running, and we know we may as well pack up; but we have bagged four hundred odd crawfish, which is not a bad evening's work.

Sometimes, especially in an unworked brook, a net will come up literally piled with these crustaceans in frantic struggles for the bait. Like most fish, the crawfish to be really appreciated should be boiled as soon as caught; and a good supper on the result of one's sport is not an unpleasant conclusion to an evening's craw-fishing.

SONG.

LILIES to the dead are due,
Roses to the quickened breath;
Both upon thy bier I strew:
Thou, who art but mine in death,
Lilies claim'st, and roses too.

Nay, the rose alone is thine,
And the lilies speak for me.
Blanching solitude is mine,
Hope deferred, which hoped for thee,
Far-off hope and joy's decline.

But the mantling, soft repose,
Prelude to a brighter waking,
Endless sun when eyes unclose
In a deathless morrow's breaking—
These are thine: these ask the rose.

AN AMERICAN WATERING-PLACE.

OF the various places of summer resort in the United States, Long Branch, which less than a quarter of a century ago was an obscure seaside village, is at the present time one of the most popular in the Union. Owing to various circumstances, it has succeeded in outstripping many of its elder rivals in the race for public favour; and from a mere barren stretch of the New Jersey coast, it has by the efforts of a few individuals been transformed into one of the most fashionable watering-places of the day. The manner in which this change has been effected is illustrative of the energy and enterprise characteristic of Americans.

Several years ago, a body of capitalists, recognising the natural advantages of Long Branch, as possessing a long stretch of beach of fine firm sand well suited for bathing purposes, determined to give it the same kind of relation to New York as Brighton has to London. The syndicate therefore bought a few of the farms in the vicinity of the village and proceeded to turn them into villa plots. But the difficulty at first was to induce people to purchase them. By dint, however, of constructing new lines of railway, of building large, well-appointed hotels, and by systematic and extensive advertising, season after season, the speculation began to enjoy a fair measure of success. But it was undoubtedly a master-stroke of policy when the owners of the property succeeded in inducing General Grant, at that time President of the United States, to pass his summers at Long Branch. This was effected by the simple device of presenting him with a handsome villa in the best part of the village. As soon as the President was settled in his new abode, the élite of Washington society followed him thither, with a crowd of office-seekers from all parts of the Union accompanied by their 'sisters, their cousins, and their aunts.' The place at once became fashionable; and since then, its popularity has known no diminution, although General Grant's successors in the Pre-

sidential chair have not invariably made it their summer residence.

In one respect the character of life at seaside places in America differs essentially from that in England. The practice of living in lodgings, so prevalent in this country, is almost unknown in the United States, the accommodation for visitors being nearly exclusively afforded by boarding-houses and hotels. In this way, although there is necessarily some sacrifice of that privacy which is enjoyed under the English system, there is an entire escape from that dullness and monotony of indoor existence which is the great drawback of watering-places in England. What, indeed, can be more *ennuyant* than, if residing in apartments at a seaside town in this country, to be compelled by wet weather to remain in the house for days in succession, without either occupation or amusement. I have experienced, *moi qui vous parle*, as Thackeray used to say, having on one occasion been kept a prisoner within doors for a week at Hastings by

A steady, uninterrupted rain
That washed each southern window-pane,
And made a river of the road;

and I do not remember to have passed a more dreary seven days in the whole course of my life. To an American, indeed, who has not that capacity for enduring ennui which is one of the characteristics of our people, such a monotonous life as that which is led by many persons at English watering-places would be simply unendurable. Tommy Goodboy, in Dickens's *Lazy Tour of Two Idle Apprentices*, says, when his friend complains of the dullness of the seaside village at which they are staying: 'There is the sea, and here are the shrimps; let us eat them.' But I fully agree with his companion when he declares, with some warmth, that the mind requires some other amusement than looking at the one, and the body some other occupation than eating the other.

Now, in the United States, instead of visitors to places of summer resort being left almost

dependent upon their own resources for amusement, ample provision is made for their entertainment. At Long Branch, besides the usual out-of-doors occupations of boating, bathing, and fishing, there are found in each of the hotels and large boarding-houses a reading-room, well supplied with newspapers and other periodicals; a billiard-room; a bowling-alley; and two or three drawing-rooms, in each of which chess, draughts, and cards are provided for the use of visitors. Nearly every evening there is a 'hop,' as informal dances are styled in America; and once a week or once a fortnight there is a full-dress ball given, an excellent band being engaged for the occasion. Under these circumstances, time need not hang heavily upon one's hands, even if the weather be unfavourable for out-of-doors pursuits.

Ocean Avenue, the principal promenade and drive in the village, extends along the shore for nearly three miles; and on the beach below, during the summer months, rows of temporary huts, of the most primitive construction, are placed for the accommodation of the public. From these shanties it is necessary for bathers to walk across the sands two or three hundred yards to the sea, movable machines not being employed at Long Branch; indeed, so far as my observation has extended, these conveniences are not provided at any American watering-place on the Atlantic. There is, however, not the same absolute occasion for the use of them in the United States that there exists in this country, since, from the nature of the formation of the whole stretch of the coast, from Fire Island to Cape May, the bather finds himself in tolerably deep water directly he enters the sea.

Of course, under these circumstances, men as well as women are compelled to wear bathing dresses. Those of the gentlemen usually consist of coarse white flannel or blue serge; those of the ladies are made of various materials and colours, and frequently elaborately trimmed. Both sexes bathe together, as is the fashion in France. At Long Branch, however, this practice is absolutely necessary as a precaution of safety, for this part of the New Jersey coast is exposed to the whole sweep of the Atlantic surges, which in rough weather dash furiously upon the shore, there being no projecting headland to break the force of the waves. It is true that a rope—attached to stakes driven into the sands—is stretched along the beach; but when the surf is very heavy, this rope is almost practically useless to women and children, as they are frequently compelled to relax their grasp of it by the force of the waves; and were they not assisted by their male companions, they would be in danger of being dragged down by the under-tow.

A favourite amusement at Long Branch is shark-fishing. The business is ordinarily conducted in this way. Several gentlemen club together and charter a sloop for the day, the owner of the vessel engaging a crew and supplying the requisite tackle. This consists of a large barbed hook quite two feet in length. To the shank of it is attached in the first instance about a fathom of iron chain, and to that a stout rope is fastened. The object of using the chain is to prevent the shark, after it has gorged the bait,

getting away, which, if the rope were connected directly with the hook, it would be easy for it to do, as the saw-like teeth of this fish will cut through the thickest cable in a few seconds. The bait commonly used is a piece of salt pork, which is a favourite delicacy with sharks. These fish are occasionally caught three or four miles off Long Branch six to seven feet long; but the average size of those captured is seldom more than four or five feet, as the larger ones as a rule do not frequent the shallow waters of the coast. The sharks, especially the bigger ones, offer a determined resistance, and it requires the united strength of several men to haul one on board. Once on deck, however, a blow or two on the head with an axe quickly puts an end to its struggles. The shark when caught is always allowed to become the perquisite of the crew of the vessel, and the sailors find a ready sale for its skin and for the oil extracted from the liver.

Deep-sea fishing of every kind is excellent along the whole coast of New Jersey, porgies, cat-fish, black-fish, blue-fish, eels, &c., being abundant. Trolling for blue-fish is considered the best sport of all, as the fisherman, instead of being compelled to sit in a boat at anchor under a broiling sun, can under full canvas pursue this amusement. The fishing-line runs about fifty yards astern, trailing the 'squid,' as the bait is technically termed, along the surface of the water. The squid, from which the hook projects, is a hollow piece of bright tin about the size of a small sprat, and when in motion, is mistaken by the blue-fish for its natural prey.

Before bringing to a close this brief sketch of life at the seaside in America, a word may be said as to the character of the climate. In the Northern States the weather during the summer months continues steadily fine for weeks in succession; while the heat, which it must be admitted is in the inland cities excessive, is tempered on the coast by refreshing sea-breezes. Indeed, there can be no question that a few degrees of latitude make a great difference in the enjoyability of existence; and in summing up the advantages possessed by seaside watering-places in the United States must be included that of being favoured with a climate at once warm and equable.

THIS MORTAL COIL.

CHAPTER XXV.—CLOUDS ON THE HORIZON.

THE Massingers pitched their tent at Whitestrand again for August. Hugh did his best indeed to put off the evil day; but if you sell your soul for gold, you must take the gold with all its encumbrances; and Winifred's will was a small encumbrance that Hugh had never for one moment reckoned upon in his ante-nuptial calculations of advantages and drawbacks. He took it for granted he was marrying a mere girl, whom he could mould and fashion to his own whim and fancy. That simple, childish, blushing little thing had a will of her own, however—ay, more, plenty of it. When Hugh proposed with an insinuating smile that they should run down for the summer to Barmouth or Aberystwith—he loved North Wales—Winifred replied with quiet

dignity: 'Wales is stuffy. There's nothing so bracing as the east coast. After a London season, one needs bracing. I feel pulled down. We'll go and stop with mamma at Whitestrand.' And she shut her little mouth upon it with a snap like a rat-trap. Against that solid rock of sheer resolution, Hugh shattered himself to no purpose in showery sprays of rhetoric and reasoning. Gibraltar is not more disdainful of the foam that dashes upon its eternal cliffs year after year than Winifred was to her husband's running fire of argument and expostulation. She never deigned to argue in return; she merely repeated with naked iteration ten thousand times over the categorical formula, 'We'll go to Whitestrand.'

And to Whitestrand they went in due time. The plastic male character can no more resist the ceaseless pressure of feminine persistence than clay can resist the hands of the potter, or wood the warping effect of heat and dryness. Hugh took his way obediently to dull flat Suffolk when August came, and relinquished with a sigh his dreams of delicious picnics by the Dolgelly waterfalls, and his mental picture of those phenomenally big trout—three pounds apiece, fisherman's weight—that lurk uncaught in the deep green pools among the rocks and stickles of the plashing Wnion. The Bard had sold himself for prompt cash to the first bidder: he found when it was too late he had sold himself unknown into a mitigated form of marital slavery. The purchaser made her own terms: Hugh was compelled meekly to accept them.

Two strong wills were clashing together. In serious matters, neither would yield. Each must dint and batter the other.

They did *not* occupy Elsie's room this time. Hugh had stipulated with all his might for that concession beforehand. He would never pass a night in that room again, he said: the paint or the woodwork or the chairs or something made him hopelessly sleepless. In these old houses, sanitary arrangements were always bad. Winifred darted a piercing look at him as he shuffled uneasily over that lame excuse. Already a vague idea was framing itself piecemeal in her woman's mind—a very natural idea, when she saw him so moody and preoccupied and splenetic—that Hugh had been really in love with Elsie, and was in love with Elsie still, even now that Elsie was away in Australia—else why this unconquerable and absurd objection to Elsie's room? Did he think he had deceived and ill-treated Elsie?

A woman's mind goes straight to the bull's-eye. No use pretending to mislead her with side-issues; she flings them aside with a contemptuous smile, and proceeds at once to worm her way to the kernel of the matter.

August wore away, and September came in; and Hugh continued to mope and to bore himself to his heart's content at that detestable Whitestrand. To distract his soul, he worked hard at his *Ode to Manetho*; but even Manetho, audacious theme, gave him scanty consolation. Nay, his quaint *Ballade of Fee-Faw-Fum*, that witty apologue, with its grimly humorous catalogue of all possible nightly fears, supplied him with food but for one solitary morning's meditation. You can't cast out your blue-devils by poking fun at them; those cerulean demons will not be laughed down or rudely exorcised by such simple means. They

recur in spite of you with profound regularity. The *fons et origo mali* was still present. That hateful poplar still fronted his eyes wherever he moved: that window with the wistaria still haunted his sight whenever he tried to lounge at his ease on the lawn or in the garden. The river, the sandhills, the meadows, the walks, all, all were poisoned to him: all spoke of Elsie. Was ever Nemesis more hideous or more complete? Was ever punishment more omnipresent? He had gained all he wished, and lost his own soul; at every turn of his own estate some horrible memento of his shame and his guilt rose up to confuse him. He wished he was dead every day he lived: dead, and asleep in his grave, beside Elsie.

As that dreaded anniversary, the seventeenth of September, slowly approached—the anniversary, as Hugh felt it, of Elsie's murder—his agitation and his gloom increased visibly. Winifred wondered silently to herself what on earth could ail him. During the last few weeks, he seemed to have become another man. An atmosphere of horror and doubt surrounded him. On the fifteenth, two days before the date of Elsie's disappearance, she went up hastily to their common room. The door was half locked, but not securely fastened: it yielded to a sudden jerk of her wrist, and she entered abruptly—to find Hugh, with a guilty red face, pushing away a small bundle of letters and a trinket of some kind into a tiny cabinet which he always mysteriously carried about with him. She had hardly time to catch them distinctly, but the trinket looked like a watch or a locket. The letters, too, she managed to note, were tied together with an elastic band, and numbered in clear red ink on the envelopes. More than that she had no chance to see. But her feminine curiosity was strongly excited; the more so as Hugh banged down the lid on its spring-lock with guilty haste, and proceeded with hot and fiery fingers to turn the key upon the whole set in his own portmanteau.

'Hugh,' she cried, standing still to gaze upon him, 'what do you keep in that little cabinet?'

Hugh turned upon her as she had never before seen him turn. No longer clay in the hands of the potter, he stood stiff and hard like adamant then. 'If I had meant you to know,' he said coldly, 'I would have told you long ago. I did not tell you, therefore I do not mean you to know. Ask me no questions. This incident is now closed. Say nothing more about it.' And he turned on his heel, and left her astonished.

That was all. Winifred cried the night through, but Hugh remained still absolute adamant. Next morning, she altered her tactics completely, and drying her eyes once for all, said never another word on the subject. She even pretended to be cheerful and careless. When a woman pretends to be cheerful and careless after a domestic scene, the luckless man whose destiny she holds in the hollow of her hand may well tremble, especially if there is something he wants to conceal from her. She means to egg it all out, and egged out it will all be, as certainly as the sun will rise to-morrow. It may take a long time, but it will come for all that. A woman on the track of a secret, pretending carelessness, is a dangerous animal. She will go far. *Hanc tu, Romane, caveto.*

On the seventeenth, Winifred formed a little plan of her own, which she ventilated with childish effusion at lunch-time. 'Hugh, dear,' she said in her most winning voice, 'do you happen to remember—if you've time for such trifles—that to-morrow's a very special anniversary?'

Hugh's cheek blanched as if by magic. What devilry was this? What deliberate cruelty? For the moment his usual courage and presence of mind forsook him. Had Winifred, then, found out everything?—A special anniversary, indeed! As if he could forget it!—And that she, for whose sake—with the manor of Whitestrand thrown in—he had done it all and made himself next door to a murderer—that she, of all people in the world, should cast it in his teeth, and make bitter game of him about Elsie's death! 'Well, Winifred,' he answered in a strange low voice, looking hard at her eyes: 'I suppose I'm not likely to forget it, am I?'

Winifred noted the tone, silently. Aloud, she gave no token in any way of having observed his singular manner.—'It's a year to-morrow since Hugh proposed to me, you know, mamma dear,' she went on, in her quietest and most cutting voice, turning round to her mother, 'and he does me the honour to say politely he isn't likely to forget the occasion.—For a whole year, he's actually remembered it. But it seems to make him terribly grumpy.—Never mind, Hugh; I'll let you off. I'm a sweet little angel, and I'm not going to be angry with my great bear: so there, Mr Constellation, you see I've forgiven you.—Now, what I was going to say's just this. As to-morrow's a special anniversary in our lives, I propose we should celebrate it with becoming dignity.'

'Which means, I suppose, the ordinary British symbol of merry-making, a plum-pudding for dinner,' Hugh interposed bitterly. He saw his mistake with perfect clearness now, but he hadn't the tact or the grace to conceal it, with a woman's cleverness, under a show of good-humour.

'A plum-pudding is *banal*,' Winifred answered with a smile—'distinctly *banal*. I'm surprised a member of the Cheyne Row set should even dream of suggesting it. What would Mr Hatherley say if he heard the Immortal One make such a proposition? He'd detect in it the strong savour of Philistia; he'd declare you'd joined the hosts of Goliath.—No. It isn't a plum-pudding. My idea's this. Why shouldn't we go for a family picnic, just our three selves, in honour of the occasion?'

'A picnic!' Hugh cried, aghast—'a picnic to-morrow!—On the seventeenth!—Then recollecting himself once more, he added hastily: 'In this unsettled weather! The sandhills are soaked. There isn't a place on the whole estate one could arrange to seat one's self down on comfortably.'

'I hadn't thought of the sandhills,' Winifred answered with quiet dignity. 'I thought it'd be awfully nice if we all bespoke a dry seat in Mr Relf's yawl!—'

'Relf's yawl!' Hugh cried aloud, with increasing excitement. 'You don't mean to say that creature's here again!'

'That creature, I'm in a position to state without reserve,' Winifred answered chillily, 'ran up the river to the *Fisherman's Rest* late last night, as lively as ever. I saw the *Mud-Turtle* come

in myself, before a chipping breeze! And Mrs Stannaway told me this morning Mr Relf was a-lying off the hard, just opposite Stannaway's. So I thought it'd be a capital plan, in memory of old times, if we got Mr Relf to take us down in the yawl to Orfordness, land us comfortably at the Low Light, and let us picnic on the nice dry ridge of big shingle just above the graveyard where they bury the wrecked sailors.'

Hugh's whole soul was on fire within him; but his face was pale, and his hands deadly cold. Was this pure accident, mere coincidence, or was it designed and deliberate torture on Winifred's part, he wondered? To picnic in sight of Elsie's nameless grave, on the very anniversary of Elsie's death, with every concomitant of pretended rejoicing that could make that ghastly act more ghastly still than it would otherwise be in its own mere naked brutality! It was too sickening to think upon. But did Winifred know? Could Winifred mean it as a punishment for his silence? Or had she merely blundered upon that horrible proposition as a sheer coincidence out of pure accident?

As a matter of fact, the last solution was the true and simple one. The sandhills, or Orfordness, were the two recognised alternative picnicking places where all Whitestrand invariably disported itself. If you didn't go to the one, you went as a matter of course to the other. There was no third way open to the most deliberate and statesmanlike of mortals. The Meyseys had gone to Orfordness for years. Why not go there on the anniversary of Winnie's engagement? To Winifred, the proposal seemed simplicity itself; to Hugh, it seemed like a strangely perverse and cunning piece of sheer feminine cruelty.

'There's nothing to see at Orfordness,' he said shortly—'nothing but a great bare bank of sand and shingle, and a couple of lighthouses, standing alone in a perfect desert of desolation.—Besides, the weather's just beastly.—Much better stop at home as usual by ourselves, and eat our dinner here in peace and quietness! This isn't the sort of season for picnicking.'

'Oh! but Hugh,' Mrs Meysey put in, with her maternal authority, 'you know we always go to Orfordness. It's really quite a charming place in its way. The sands are so broad and hard and romantic. We sail down, and picnic at the lighthouse; and then we get a man to row us across the river at the back to Orford Castle—there's a splendid view from Orford Castle—and altogether it makes a delightful excursion, of its kind, for Suffolk. We ought to do something to commemorate the day.—If we weren't in such deep mourning still'—and Mrs Meysey glanced down with a conventional sigh at her crape excrescences—'we'd ask a few friends in to dinner; but I'm afraid it's a little too soon for that. Still, at anyrate, there could be no harm—not the slightest harm—in our just running down to Orfordness for a family picnic. It's precisely the same as lunching at home here together.'

'Do you remember, Hugh,' Winifred went on, musingly, putting the screw on, 'how we walked out that morning, a year ago, by the water-side; and how you picked a bit of forget-me-not and meadow-sweet from the bank and gave it me; and what pretty verses about undying love you repeated as you gave it?—And in the evening,

mamma, I had to go out to dinner, all alone with you and poor dear papa, to Snade vicarage! I recollect how angry and annoyed I was because I had to go out and leave Hugh that particular evening! and because I'd worn that same dinner dress at Snade vicarage three parties running!

'Yes,' Mrs Meysey continued, with another deep-drawn sigh; 'and what a night that was, to be sure! So full of surprises! It was the night, you know, when poor Elsie Challoner ran away from us. You got engaged to Hugh in the morning, and in the evening Elsie disappeared as if by magic! Such a coincidence! Poor dear Elsie! Not a year ago! A year, to-morrow!'

'No, mother dear. That was the eighteenth. I was engaged on the Wednesday, you recollect, and it was the Thursday when we found out Elsie had gone away from us.'

'Thursday the eighteenth when we found it out, dear,' Mrs Meysey repeated in a decisive voice (the maternal mind is strong on dates); 'but Wednesday the seventeenth, late in the evening, of course, when she went away from us.—Poor dear Elsie! I wonder what's become of her! It's curious she doesn't write to you oftener, Winifred.'

Were they working upon his feelings, of *malice prepense*? Were they trying to make him blurt out the truth? he wondered. Hugh Massinger in his agony could stand it no longer. He rose from the table and went over to the window. There, the poplar stared him straight in the face. He turned around and looked hard at Winifred. Her expressionless blue eyes were placid as usual. 'Then, if it's fine,' she said, in an insipid voice, 'we'll ask Mr Relf to give us a lift down to Orfordness to-morrow in the *Mud-Turtle*.'

'No!' Hugh thundered in an angry tone. 'However you go, Relf shan't take you. I don't want to see any more of Relf. I dislike Relf; I object to Relf. He's a mean cur! I won't go anywhere with Relf in future.'

'But, children, you should never let your angry passions rise,' Winifred murmured provokingly.

'Your little hands were never meant
To tear each other's eyes.'

If he doesn't want to go in Mr Relf's boat, he shan't be made to, then, poor little fellow. He shall do exactly as he likes himself. He shall have another boat all of his own. I'll order one this evening for him at Martin's or at Stannaway's.'

'If it's fine,' Mrs Meysey interposed parenthetically.

'If it's fine, of course,' Winifred answered, rising. 'We don't want to picnic in a torrent of rain.—Whatever else we may be, we're rational animals.—But how do you know, Hugh, what Orfordness is like? You can't tell. You've never been there.'

'I went there once alone last year,' Hugh answered sulkily; 'and I saw enough of the beastly hole then to know very well I don't desire its further acquaintance.'

'But you never told me you'd been over there.'

Hugh managed to summon up a sardonic smile. 'I wasn't married to you then, Winnie,' he answered, with a savage snarl, that showed his pro-

jecting canines with most unpleasant distinctness. 'My goings-out and my comings-in were not yet a matter of daily domestic inquisition. I hadn't to report myself every time I came or went, like a soldier in barracks to his commanding officer.—I went to Orfordness one day for a walk—by myself—unbidden—for my own amusement.'

All that afternoon and late into the evening, Hugh watched the clouds and the barometer eagerly. His fate that day hung upon a spider's web. If it rained to-morrow, all might yet be well; if not, he felt in his own soul they stood within measurable distance of a domestic cataclysm. He would not go to Orfordness with Winifred. He could not go to Orfordness with Winifred. That much was certain. He could not picnic, on the anniversary of Elsie's death, within sight of Elsie's nameless grave, in company with those two strange women—his wife and his mother-in-law. Ugh! how he hated the bare idea! If it came to the worst—if it was fine to-morrow—he must either break for ever with Winifred—for she would never give in—or else he must fling himself off the roots of the poplar, where Elsie had flung herself off that day twelve months ago, and drown as she had drowned among the angry breakers.

There would be a certain dramatic completeness and roundness about that particular fate which commended itself especially to Hugh Massinger's poetical nature. It would read so like a Greek tragedy—a tale of Atë and Hubris and Nemesis. Even from the point of view of the outer world, who knew but the husk, it would seem romantic enough to drown one's self, disconsolate, on the very anniversary of one's first engagement to the young wife one meant to leave an untimely widow. But to Hugh Massinger himself, who knew the whole kernel and core of the story, it would be infinitely more romantic and charming in its way to drown one's self off the self-same poplar on the self-same day that Elsie had drowned herself. No bard could wish for a gloomier or more appropriate death. Would it rain or shine? On that slender thread of doubt his whole future now hung and trembled.

The morning of the seventeenth dawned at last, and Hugh rose early, to draw aside the bedroom blinds for a moment. A respite! a respite! It was pouring a regular English downpour. There was no hope—or no danger, rather—of a picnic to-day. Thank Heaven for that. It put off his fate. It saved him the inconvenience and worry of having to drown himself this particular morning. And yet the *dénouement* would have been so strictly dramatic that he almost regretted a shower of rain should intervene to spoil it.

At ten o'clock he started out alone in the blinding downpour and took the train as far as Aldeburgh. Thence he followed the shingle beach to Orfordness, plodding on, as he had done a year before, over the loose stones, but through drenching rain, instead of under hot and blazing sunlight. When he reached the lighthouse, he sat himself down in pilgrim guise beside Elsie's grave in the steady drip, and did penance once more by that unknown tomb in solemn silence. Not even the lighthouse-man came out this time to gaze at him in wonder; it poured too hard and too persistently for that. He sat there alone for

half an hour, by Elsie's watch; for he had wound it that morning with reverent hands, and brought it away with him for that very purpose. A little rusty, perhaps, from the sea, it would keep good time enough still for all he needed. At the end of the half-hour he rose once more, plodded back again over the shingle in his dripping clothes, and catching the last train home to Almundham, reached Whitestrاند just in time to dress for dinner.

Winifred was waiting for him at the front door, white with emotion—not so much anger as slighted affection. 'Where have you been?' she asked, in a cold voice, as he arrived at the porch, a dripping, draggled, wearied pedestrian, in a soaking suit of last year's tweeds.

'Didn't I say well I was bound to report myself to my commanding officer?' Hugh answered tauntingly. 'All right, then; I proceed at once to report myself. I may as well tell you as leave you to worry. I've been to Orfordness—alone—tramped it.'

'To Orfordness!' his wife echoed in profound astonishment. 'You didn't want to go with us there if it was fine. Why, what on earth, Hugh, did you ever go there in this pelting rain for?'

'Your mother recommended it,' Hugh answered sullenly, 'as a place of amusement. She said it was altogether a most delightful excursion. She praised the sands as firm and romantic. So I thought I'd try it on her recommendation. I found it damp, decidedly damp.—Send me my shoes, please!' And that was all the explanation he ever vouchsafed her.

THE KITCHEN CHEMISTS OF ANCIENT TIMES.

GASTRONOMY is a science or art—though the term science is far more exact and descriptive—possessing special interest for us, and we should not be astonished to see how voluminous and varied is its literature. Looking over the ancient writers on this fascinating subject, we nevertheless see much to wonder at, still more to make us stop, and gravely reflect on that well-worn and venerable adage, 'There is nothing new under the sun.'

In the kitchens of the ancients we find the cooks marshalled in regular order, each according to his rank and skill. Among them we find the 'structor' in high estimation. This individual was an artist of considerable merit, who claimed a full share of admiration as a right learned professor; and indeed we feel quite inclined to bow to his claims, and, moreover, enrol him in the noble army of practical chemists. He it was who performed marvels both to charm the eye and delight the palate of the epicure. With a common turnip, a harmless gourd, vegetable marrow, or pumpkin, he could counterfeit with astonishing faithfulness both the shape and taste of fish, flesh, or fowl. Let a king in a far inland camp express a craving for the unprocurable sardine or delicate anchovy, and straightway the structor brought his consummate art into play, and at once the trick was done, and royalty could sit down to discuss a delicious dish of fresh herrings or the much esteemed scarlet rock-fish. We are told that a certain king of Bithynia, while leading his army on some inland expedition, had an intense longing

for his favourite titbit—pilchards. Luckily, a structor was at the head of his majesty's culinary suite. He took a turnip, cut it into the resemblance of the desired pilchards, fried them tenderly in oil, salted and powdered them with the seeds of black poppies, and served the dish to the impatient monarch. His majesty was right well pleased, and recommended the dish as an excellent fry of pilchards. On other occasions the structor was as adroit in preparing flesh courses with the most humble not to say despised of roots.

Greek cooks, as we see in the writings of many of the ancients, claimed that there were few professions requiring wider and sounder knowledge and philosophy than that of cooking; and we can hardly doubt them. The Roman cooks were quite as clever. We are told on credible authority that they contrived to serve up pigeons and young spring chickens—no matter at what season—even though they had nought but the flesh of four-footed beasts or fish on which to exercise their art. Martial has recorded a sumptuous dinner where the guests thought they were partaking of tunny, anchovies, sausages, besides a great number of different vegetables; yet the cook only used common pumpkins, seasoned with oils, various condiments, seeds, and roots.

Now, these culinary feats are pretty well authenticated, and may be accepted as historically reliable facts. We are inclined to inquire: Were these old-world cooks chemical adepts? For, without a doubt, the semi-magical transformations of the structor were nothing more than the labours of clever chemists. Whether he knew it or not, he availed himself of such roots, seeds, and herbs as our chemists of to-day would choose were they to attempt such gastronomic feats. The *Chenopodium vulvaria*—or 'stinking goose-foot,' as it is popularly and appropriately called—is a vegetable sufficiently well known, though not admired either for its beauty or sweet scent. As a matter of fact, it possesses a most disagreeable odour, much resembling that of putrid salt or dried fish. If portions of this plant be distilled together with a solution of common soda, a volatile alkaloid substance passes over. This substance has a rank smell of putrid fish; it is known to chemists as 'trimethylamine.' The 'skunk-cabbage' of America, the agavé of Mexico, and our own common henbane, possess strong smells of putrid flesh, and hence have been vulgarly christened 'carriage plants.' To this list we may add some varieties of the African cacti, and several species of mushrooms and fungi.

We know the constituents of these vegetables now, and can trace without much difficulty their peculiar virtues, by chemical analysis, to special alkaloids. It is undoubtedly of such uninviting and unpromising materials that the structor contrived to delight the 'jovial fellows' of his day.

It is very curious to observe this, the more so if we cannot believe that a knowledge of chemistry had spread so widely and been reduced to such definite rules as these facts would seem to imply. If we are forced to adopt another hypothesis, that the structor's success was merely owing to chance observation, we cannot help admiring the result of such observations, and wondering at their thus falling across apparently obnoxious weeds—they even pressed into their

service the asafœtida—for the concoction of elaborate and delicious artificial dishes.

The modern chemist has lost the secret knack of the ancient structor; still, with a little skill and some study, the art might be revived. The late Professor James F. W. Johnston, a high authority on matters relating to analytical chemistry, says (apparently ignorant or oblivious of the fact that he had been anticipated centuries ago): 'I may suggest to the cook, however, as a possible use to which these fishy-smelling compounds may hereafter be put in the cuisine—the flavouring of imitation fish-cakes, crab, lobster, crayfish, and oyster-pâtés, fish-sauces such as the anchovy, &c. Such preparations as these, by the application of a little skill, may pass off at table, and be made to please the palate as well as genuine salt-water productions, though containing nothing that ever lived in the sea.'

Though only practised extensively by the ancients, yet the art lingered, and even still lingers in out-of-the-way corners. Mercier, who wrote on the customs of the Parisians in 1782, tells us much that is interesting about the table and kitchen. He says that the duchesses and marchionesses had become such gourmands, and carried their love of change so far, that they absolutely declined to eat solid meats or anything prepared in the ordinary way. They disdained having to chew their meats like their vassals the *roturiers* and common herd. The cooks were therefore obliged to reduce everything to *consommés*, jellies, and *purées*. He tells us also: 'Our cooks anxiously turn their attention to the disguising of every dish. During Lent, the king's cooks serve up dinners where vegetables are made to assume the shape of every fish in the ocean; they even contrive to give the flavour to these dishes of the fishes they imitate.' Thus the good king, cardinals, and bishop, while religiously abstaining from forbidden dainties, found an easy and agreeable way of satisfying their gastronomic cravings.

To this day in Italy we may taste excellent veal-pâtés, or wholesome fried pork, made out of tunny-fish; fish-curies of exquisite delicacy made of vegetable marrows. In these instances, it is simply the mode of curing, the oil used, and, in the case of the vegetable marrows, the chemical effect of the heat and curry powder, which cause the change. Beefsteaks, again, juicy and splendidly tender, may be cut from the stem of a pine-tree! These are large mushrooms, or fungi, which are impregnated with a red blood-like fluid.

It would indeed be at once interesting and amusing to see our chemists put on the apron and white cap and serve up a complete artificial dinner from their laboratories, so that the bread and vegetables should come before us in the shape of crayfish soup, well-fried herring, or carefully boiled cod, oyster-pâtés, fish-sauces; to be followed by steak-pies and savoury ragouts. We know that they could with ease, and indeed daily do, serve us with an artificial cheese or paste of jargonelle pears and artificial apple-candy. Such things have been done, and can be repeated. The vegetable juices, long locked up in our coal-beds, are now set free from the odorous tar, to assume considerable commercial importance as flavouring essences. What, however, really arrests our attention and calls for our wonder, with our

present chemical knowledge, is, that so long ago the old-world cooks should not only have discovered, but made practical use of the mysterious chemical virtues of these paradoxical vegetables.

MIN:

A RAILROAD STORY OF THE FAR WEST.

CHAPTER II.

Six weeks of summer passed, and the grand weather of early fall filled the free broad prairies with such an intoxicating atmosphere as only haunts the plains of the West when there is just the faintest suspicion of frost before the sunrise. Macpherson was sitting at his table, with his head turned toward the west window, watching for the freight-train which the telegraph had told him was on the way from Prairie City, a station thirty-odd miles to the west. Away on the horizon the smoke from the locomotive was just becoming visible, when something more tangible than smoke darkened the window—something alive. Mac could scarcely believe his own eyes when he saw that the object was a human being, and a girl at that! Not a fashionably attired young lady, not a city belle, but still, a rather attractive specimen of the gentler sex. Mac could just see enough of a horse's mane to know that his visitor was mounted. Not being posted in feminine fashions or in anywise interested in ladies' wearing apparel, he did not particularly notice the girl's dress. He did, however, perceive that she was young, healthy, and graceful, with a face which, though sadly tanned by the weather, was of rare beauty; while from her head, which was hatless, flowed magnificent tresses of brown wavy hair. That she was rude and untutored, a 'child of the plains,' was apparent as soon as she spoke, and yet her girlish voice sounded strangely sweet and musical to the agent, who for so long had heard nothing but a few passing words from the train-men as they went through 44-mile.

'Be you the agent?' asked the girl, bending forward through the open window.

'Yes, madam,' responded Mac, with as much gravity as though he were selling a ticket to some city dame.

'Well, dad's offul sick; an' he sez as how you kin telegraft ter 'Stan'ople fer a doctor. Kin you, mister?'

'Yes, I guess I can manage to wire for a doctor. But come in, missy. Here's a train coming; it will be gone in a few minutes, and then I can wait on you. Hitch your pony behind the shanty while you come in and rest awhile.'

The girl sprang with agility from her wiry little pony, made him fast, and entered the 44-mile depot. Mac made her sit in his easy-chair, which was evidently a novel luxury to the young lady. She tried to fit it in various ways while Mac was busy giving running orders to the conductor of the freight-train, and at last settled down into a comfortable position. The girl was quite young, perhaps sixteen, and was attired in an old worn and oft-washed cambric gown; while her shoes were evidently 'home-made.' Her dress was short, and betrayed the fact that her feet were stockingless.

What struck Mac—what struck many besides

Mac, afterwards—was the girl's wondrous grace and evident strength of limb: these characteristics were even more prominent than her luxurious hair and bright Western countenance.

'And now,' said Mac, as the freight-train went on its way eastward, leaving only the caboose and a cloud of smoke visible—'now we can talk.—So "dad" is sick. Well, who is "dad"? Where does he live, and what is the trouble?'

But Macpherson's visitor was evidently of a practical turn of mind, for she replied: 'Say, mister, what's the matter with telegrafting for the doctor before we hev our talk?'

'Good for you, Miss—Miss?'

'My name's Min—Min Rossiter.'

'Well, Miss Min, your suggestion's a good one.—Dad's very sick, and needs a doctor? We'll see what they can do for us at Constantinople.' Macpherson turned in his seat, reached his hand over to the 'ticker,' and with his long finger began to tap off a message to the man at Constantinople. 'Click-click, click-clicketty-click,' went the little hammer, while Min watched the performance with wide open eyes and mouth. Mac stopped; but in a minute the ticker started off again, moved by some unseen power, and as the clicking continued, Arthur slowly repeated, aloud, for the girl's benefit: 'Doctor—lives—quite—close—just—left—depot—for—his—house—will—send—over—and—let—you—know—in—five—minutes.'

'Now, then,' said Mac, 'while we are waiting to hear from the doctor, tell me where you live and what is the trouble. Your home must be a long way from here, because I am certain there is no house within sight.'

'All right, mister.—My dad is Jack Rossiter, an' he's pretty old now. Dad's been sick all winter; but he never complained much. Our shanty's over by the Yellow Bottom Creek, 'bout twelves miles from the railroad. I hain't been anear the track since dad an' me come to see the first train go by, more'n three years ago. I was fifteen years old last spring, an' mam's been dead five years. She taught me to read an' write a little, an' learned me to sew an' mend; but sence she died I've had ter sorter look after things for dad, an' hain't had no time for myself. Dad came out here from Illinois, when I was a wee tod of a thing, more'n ten years ago. He allus allows he made a big mistake settlin' on the Yellow Bottom. I think he'd 'a gone back to Illinois if mam had lived; but when she died, the old man lost heart, an', besides, he's been sick quite a good deal.—Yes, dad an' me's all alone now. We hain't got no neighbours within half-a-day's ride. We've raised considerable live-stock o' one kind an' nuther; but o' late years the thievin' Indians come in nights an' steal most of it. We hain't got much money left, I know, an' now dad's real bad, an' I'm 'fraid he's goin' to die.—Ain't thet the doctor, mister?'

The 'ticker' was clicking once more. Mac read the message: 'Doctor—says—he—will—start—on—the—express—to-morrow—mornin'—cannot—leave—before—as—there—is—no—train.'

'Now,' said Mac, 'I did not tell the doctor who was sick nor how far he will have to go after he gets off the train, for fear he might not come. The question now arises, how is he going to find his way over to your place?'

'What time does the train get in, mister?'

'Seven o'clock to-morrow morning.'

'I'll be on hand with dad's horse for the doctor to ride.—Good-bye, mister, an' thank yer.'

The girl would not wait to partake of refreshment, which Mac wished to prepare for her. She unhitched her pony, vaulted across its little back, and galloped away like a true child of the prairies. That was about four in the afternoon. At midnight, Macpherson was soundly sleeping in his 'furnished room,' when he was awakened by a hammering on the door of the 'office,' while a not unfamiliar voice called: 'Mister! Hello, mister!'

He jumped up, pushed his legs through his most important garment, and went to the door. In the moonlight he saw the girl Min seated on a gaunt old horse, a horse of twice the framework of the pony she had ridden in the afternoon, but with scarcely as much meat on his bones.

'Say, mister, I thought I might save the doctor a no-account trip. Dad's dead. I found him stiff an' cold on the bed when I got home.—Poor old dad!' The girl was not crying—did not appear to have been crying, and Mac was a little surprised that she took her misfortune so coolly.

'I'm very very sorry for you,' he said. 'Do come in and rest in my big chair. I will wire Constantinople for them to send a man to relieve me for a day, instead of the doctor, and in the morning I will go over with you to your place. Perhaps I can help you.'

Arthur lit a lamp and a fire. Soon he had the tired girl drinking a cup of hot coffee; and before he got around to his day's work—which commenced at two A.M.—he experienced the pleasure of seeing her quietly sleeping in his large chair.

The next morning, before Min was awake, Ratty Sykes dropped off the express and thrust his long angular limbs into the office. 'Great Scott, man!' he said to Macpherson, 'what's eatin' yer, anyhow? You've raised more excitement atween 44-mile an' 'Stan'ople than's bin knowed in a coon's age. Who'd ha' thought I'd iver hev come ter 44-mile as relief-agent? Here hev I bin playin' gentleman fur over six weeks, an' I break the spell by puttin' in a day's work at the ole cabin.—But what's up, pard? Holy smoke!' This last rather original expletive was called forth by a sight of Min sleeping in the easy-chair. 'A gal, by thunder! Wal, ef this yere don't lick the globe! Darned ef I kin believe my eyes. Is it 44-mile?'

Mac was not much disposed to humour Ratty by telling all the girl's story; still, he felt under some obligation to the man for coming out so promptly to relieve him, so told as much about Min as he thought necessary. Then he woke the child; and after they had all partaken of a simple breakfast, Mac and his new protégée rode slowly away on the old horse, Min sitting like a lady in front of Arthur.

It was almost noon when the travellers reached the bank of the broad but shallow and very muddy stream known as the Yellow Bottom Creek. The Rossiter homestead was a miserable frame shanty, very little larger than the station building at 44-mile. It consisted of a meagre apartment, used as kitchen and living-room, and two small, poorly furnished bedchambers. Upon a bed in one of these undersized rooms lay the

dead body of a man prematurely old—a man (one of thousands) who had died of overwork, exposure, and disappointment, as a pioneer on the plains.

Mac had done many strange things in his life, but he now, for the first and last time, dug a shallow grave, into which, with Min's aid, he gently laid 'dad' beneath the prairie sod. Then he investigated a little, with the result that he found nothing of any account among old Rossiter's possessions. He did discover an old-fashioned wagon, a cow, and the two samples of horse-flesh with which we are already acquainted. He was certain it was no place to leave a lonely girl, especially with winter fast approaching; and as the land was practically valueless, he advised Min to desert the river-side for the present at least. So Mac harnessed the old horse to the wagon, which he loaded up with one or two pieces of furniture, Min's personal effects, and some poultry. Then he fastened the cow to the rear of the wagon, and, with Min mounted on the pony alongside, he started for 44-mile.

Min was not so talkative as she had hitherto been. Now that her father was under the ground and she herself leaving the place which had been her home for years, she seemed to realise all that had overtaken her. She was even more affected than she appeared to Macpherson, though he detected more than once the tear-drops coursing down her sunburnt cheeks. Mac tried to cheer her with a few remarks and suggestions as to the future. 'We'll build you a bit of a place not very far from the depot. You shall keep the poultry and the cow and sell me eggs and milk. Why, we shall have a regular little town up to 44-mile, now. Soon we shall have to build a church and sign a petition for a post-office, if we wish to keep abreast of the rest of the world.'

It was quite late when they reached the station. Ratty Sykes was sleeping soundly on Arthur's bed, and Arthur did not wake him. Arthur Macpherson was rather glad, for himself, to have had this girl thrown in his way, and he did not propose to have his day-old plans spoiled by Ratty Sykes. So Mac persuaded Min to again rest in the big rocking-chair, and the girl was soon asleep. At ten o'clock the train for Constantinople came through, at which time Mac went into the little bedroom and shook Sykes, yelling in his ear: 'Turn out, my lad; here's your train—and here's what I owe you.' Ratty was only half awake, but he heard the locomotive bell and hurried out of doors: he was also wide awake enough to grab the two-dollar bill which Arthur pushed into his hand. Mac had his train orders all ready written out, so that in a minute the train was gone, leaving Sykes no time to ask questions.

Arthur Macpherson, though holding an inferior post, was essentially a gentleman; in other words, he was an honourable as well as a kind-hearted man. He had taken a fancy to Min, but only as a man may be interested in a pretty and 'odd' child. For reasons of his own, he had elected to reside at 44-mile, or a similar place; but the social instinct was still strong within him, and he had often longed for company. If it had come to him unsought, in the person of this little waif of the prairies, why should he allow the idle curiosity and gossip of men like Ratty Sykes to spoil it? Arthur Macpherson was not many

years past thirty, but he felt very old that early morning as he thought the matter over. 'I'm twice as old as the girl anyway,' he reasoned—'quite old enough to take a fatherly interest in her.' And he did—for the time being.

Arthur was very busy for several following days. In about a week the railroad men began to notice a new building a few rods distant from the depot at 44-mile, and many were the questions as to the 'new settlers' put to Macpherson by the engineers and conductors who stopped at his cabin for orders. Before cold weather set in, Mac had Min snugly housed in a little two-roomed dwelling, which, although it might have appeared decidedly rude and insignificant in a town of any architectural pretensions, Min declared was a 'real cute place, anyhow.' In addition to the cottage, a shed was erected for the 'live-stock.'

And then came the winter—a winter which, notwithstanding the drawbacks and hardships of a telegraph operator's life on the plains, proved a quietly pleasant time for Arthur Macpherson and for Min Rossiter too. When the girl first made her appearance at 44-mile station, she was a fair specimen of the wild and uncultured child of the plains. When the mild spring weather made its appearance, she was a tolerably well-informed girl. Arthur, all through those months of snow and frost, took especial delight in instructing his companion, not only in the three Rs, but in general information. Macpherson had read largely along various lines of literature, and even in that out-of-the-way spot kept himself posted in the world's doings by means of Chicago newspapers which reached him two days old. He found in Min a bright girl, eager and quick to learn all he could teach her; so, all the time he could spare from his duties, which were not arduous by any means, he devoted to the girl. And as Min grew in knowledge, she also grew womanly and refined; not with the refinement of New York or London or Paris 'society,' but nevertheless refined—in her thoughts, her words, and her actions. She was a girl, too, with a large heart, like most Western girls, and she appreciated to the fullest extent all that Arthur did for her, showing her gratitude in many little ways. She tidied up his 'furnished room' and the office each day, added to his table many little delicacies of culinary art, the secrets of which were unknown to Arthur, and made her womanly presence known in a hundred ways that could be *felt* rather than perceived by Macpherson.

One thing she did, quite unaided, which much surprised and pleased Arthur when he became aware of it. By merely watching Macpherson, and by practising at odd times on a spare instrument not connected with the battery, she mastered the telegraph operator's art so well, that in less than six months she was an expert at the work, and often relieved Mac when, by any chance, the messages were extra long and numerous.

Of Min's previous history Arthur learned very little more than she told him on their first acquaintance; indeed, there was little more to tell. On the other hand, as Min came to know her good friend better, and as her interest in him grew stronger, she felt sure that he was a man whose life had not always run in the narrow groove of a frontier operator. But with a fine

feeling, which was hardly to have been expected of her, she never questioned him, though he at last satisfied her curiosity to some extent by relating a little of the record of his life.

Arthur Macpherson told his story as of some third person, but Min felt intuitively that it was of himself he spoke. It was a simple story of devotion and admiration almost approaching worship yielded by a young lad to his elder brother. These two brothers were of an old Southern family, with more of gentle blood and intelligence than of this world's goods. Both lads were college bred, and both came North to earn the livelihood which seemed impossible in the conservative South. There was a difference of nearly five years in their age, and by that number of years the older lad preceded his brother to the North. He entered the railroad service, and succeeded. The younger man followed in the footsteps of his brother when he was twenty years old, and also took a position in the telegraph department of the same railroad. Both were located in the same town, and the elder was at the head of the office in which the younger brother worked. He was what is known as Chief Train Despatcher—a most important position on a single-track road, where trains are moved in both directions on the same line of rails by telegraphic orders from the Despatcher, who keeps constantly before him the exact position of all trains, arranging passing-places, and the like. It is unnecessary to state that a clear head is absolutely requisite in the man holding such a position. In an evil hour, Robert—as Macpherson called the elder of the brothers—took to poker-playing; and after playing for hours for heavy stakes, his nerves always became more or less weakened. Upon one memorable occasion Robert went on duty at midnight with his brother as his assistant, and the latter saw that Robert was unduly excited. The fact was that the Despatcher had just come from a protracted sitting at the card-table. Still, he looked over the time schedule and telegraphic reports, and seemed to grasp the situation with his usual alacrity. With his papers before him he sat down, and from time to time wrote out orders for his brother Harry (Mac called him Harry) to send over the wires. About three in the morning came the report of a collision down the road. The Train Despatcher had given a wrong order! Both the brothers were greatly shocked; and the elder, being responsible for the accident, which was attended with fearful loss of life, was almost beside himself with terror. And now came the opportunity for Harry to prove his genuine devotion to his brother, a brother who was really not worthy the sacrifice about to be made in his behalf.

'Robert,' he said, 'I sent that message.—I am going to run away.—Nay, don't stop me. Tomorrow, when the officials investigate, I shall not be here. You need say nothing—to them my disappearance and your silence will explain all. It was an accident, anyway: no one would do such a thing on purpose. Stay where you are—you have more to lose than I have.—Good-bye, Bob.'

Robert certainly had more to lose in the way of a position than his brother, and he was ambitious. But he was also utterly and thoroughly selfish. Of course the investigation came; but Harry, the telegraph operator, had 'jumped the

town.' Naturally, the blame fell on the absent man, for (strangely?) the written orders found on the telegraph table were apparently correct. Robert, as a railroad man, was saved. The terrible error of that night he never forgot: he never again gambled and never drank intoxicating liquor; he became a model official, and promotion rapidly overtook him. Ten years later, he became one of the chief officials of one of the largest railroads in the world. But he *did* forget, and never once by word or deed sought the lad who sacrificed his own reputation to save that of his cold-blooded brother. And that boy went under an assumed name all through the great civil war between the North and the South, after which he tried the gold diggings in California as well as the silver mines of Nevada. For years he tried by excitement and hard work to suppress the feeling of resentment which he now and again experienced when he thought of his brother's base ingratitude. 'But to-day,' said Macpherson, as he closed his narrative, 'he is quietly settled at his old work of telegraphy, and at just such a wild place as 44-mile. Perhaps the strangest part of it all is that he is working under his brother Robert; only there is a wide gulf fixed between them, socially and professionally, and Robert is quite ignorant of his brother's whereabouts.'

THE KOLA NUT.

In an interesting paper read before the Fiji Agricultural Association, Sir John B. Thurston described at some length the interesting properties of the Kola Nut (*Sterculia acuminata*), one of the most useful of the products obtained from Africa. Acknowledging his indebtedness to the information given by Mr T. Christy, F.L.S., in his *New Commercial Plants and Drugs*, Sir John stated that the fresh kola nut had the singular property of clarifying beer and spirits, and of rendering drinkable the foulest waters, evidently owing to the mucilage contained in the nut; and that at the Linnean Society, one of the members—a planter from Jamaica—gave it as his experience that he had seen his foreman cured of drunkenness by being made to swallow a paste consisting of kola and cream. An explanation of this property of the kola nut may be looked for in the fact that it contains over two per cent. of caffeine, the active ingredient of the coffee-bean; for it is a well-acknowledged fact that strong black coffee has a decided effect in righting those who are under the influence of drink.

Sir John then informed his hearers of the discovery that the kola nuts had been prepared by a special process into a paste that cannot be distinguished from cocoa paste. Experiments go to prove that if kola paste be mixed with cocoa it gives chocolate of a quality superior to Caraccas; and that, if mixed with three parts of a low-class cocoa, it improves the latter both in strength and flavour to an astonishing degree. Chocolate made with the kola is ten times more nutritious and sustaining than if made with cocoa, and has, we hear, been in use for the past three or four years in some of the London hospitals as a sustaining and stimulating adjunct in exhaustive and wasting diseases, also where it is necessary to resort to a depressing treatment. We find also the testimony of the sustaining power of the kola nut in a

Report from the Director of the government telegraphs in Egypt, who, during one of his forced excursions into the interior, subsisted solely upon kola chocolate and a few biscuits, without any ill effects.

Kola and its preparations would appear to be of the greatest importance as a food-product. It contains a larger percentage of caffeine than does even coffee, and about five times more than tea. With regard to nitrogenous principles, it will be found that kola is superior to cocoa, coffee, and tea. Its position in medicine is far above that of the maté (Paraguay tea), coca, and guarana.

The flavour of kola is by no means unpleasant, being first sweet, then astringent, and finally bitter. This bitterness in the dried nut partly disappears, but upon soaking the nut in water is nearly restored. In the form of chocolate flavoured with sugar and vanilla, a very pleasant preparation is obtained, which would be a great convenience to travellers taking long journeys without the opportunity of making a proper meal.

As a medicinal product, the kola nut has had a fair share of attention, and has given good results in periodical and chronic headaches, so distressing to the sufferer, in derangement of the equilibrium of the nerves, in heart-complaints, and in diarrhoea. Its greater sphere of action is, however, as a pleasant beverage for delicate constitutions, invalids, convalescents from lowering diseases, and in those cases in which a gentle but sure sustaining and tonic treatment is necessary for the nerves, the digestive organs, and the general condition of the body.

The kola-nut tree is now being cultivated in the West Indies and in certain portions of our Eastern possessions. It is a tree of great interest as regards its habits and treatment for the collection of its crop, and it may interest our readers to take from Mr Christy's book the following extracts :

'On the west coast of Africa, its native country, the kola-tree commences to yield a crop about its fourth or fifth year; but it is not until its tenth year that it is really in full bearing. A single tree will then yield an average of about one hundred and twenty pounds of seed per annum. After the tree reaches maturity, the flowering is nearly continuous, so that a large tree bears flowers and fruit at the same time. There are, in fact, two collections: the June flowering yielding the fruit in October and November; and that of November and December, in May and June. When the fruit is ripe, it takes a brownish-yellow colour, and in this condition dehiscence of the capsule commences along the ventral suture, exposing red and white seeds in the same shell, and it is at this period that they are gathered. According to some authorities, there exist two varieties of kola, one yielding exclusively red seeds, and the other white; but such is not the case. The same capsule may contain up to fifteen seeds, varying considerably in size, white and red together, without the white being considered less ripe than the red. The carpels are from six to nine centimetres long, and three to five thick, and the spongy pericarp is two or three millimetres thick. As many as five ripe carpels may result from a single flower, and these may each contain from five to fifteen

seeds; but in some cases carpels are to be found containing only a single seed. The seeds removed from their envelope weigh according to their development from five to twenty-five or twenty-eight grammes. The epidermis is the principal site of the colouring matter, and beneath it is a tissue, consisting of a mass of cells gorged with large starch granules comparable to potato starch. It is in these cells that the alkaloids caffeine and theobromine are found in the free state.

'On the west coast of Africa the collection is conducted with great care, and is made by women. The seeds are removed from the husk and freed from the skin. In order to maintain their value among the negroes, it is necessary to keep them in a fit state and in good condition. They are therefore carefully picked over, all damaged and worm-eaten seeds being removed, and the sound seeds are then placed in large baskets made of bark and lined with leaves of *bal* (*Sterculia heterophylla*). The seeds are then heaped up and covered over with more bal leaves, which by their thickness and dimensions contribute not a little to the preservation of the seeds by keeping them from contact with dry air. Packed in this manner the seeds can be transported considerable distances, remaining free from mould for about a month, during which time it is not necessary to submit them to any treatment in order to preserve them fresh beyond keeping the bal leaves moist. But if it be desired to keep them beyond that time, the operations of picking and packing have to be repeated about every thirty days, the seeds being washed in fresh water and fresh bal leaves placed in the baskets. Each of these packages usually contains about three hundredweight of seeds. It is in this condition that kola is sent into Gambia and Goree, where the principal dealings in the seeds are carried on. In Gambia they are sold in the fresh state to merchants travelling with caravans into the interior, to make a very agreeable stimulating and nourishing beverage. It most frequently arrives at Sokoto and Kouka in the Soudan and Timbuctoo, where large sales of the seeds are made in the fresh condition. From the Soudanese markets it is carried by caravans to Tripoli, and from Timbuctoo to Morocco.

'As might be expected, the value of the kola increases as it makes its way into the interior of Africa, and it is stated that some of the tribes farthest removed from the sea pay for the dry powder with an equal weight of gold-dust. Kola plays a most important part in the social life of many of the African tribes. An interchange of white kola between two chiefs is indicative of friendship and peace, while the sending of red kola is an act of defiance. When a young chief proposes for the hand of a lady, he sends an offering of white kola to his intended bride's mother: if she returns white kola, the happy suitor is accepted; but his hopes are blighted if red is sent back. The absence of a supply of kola from among the marriage presents would probably endanger the whole arrangement. All the negro West African oaths are administered in the presence of kola seeds; the negro will stretch out his hand over them while he swears, and eats them directly afterwards.

'Fresh kola is used as a masticatory, as is also the dried powder, by the tribes in the African interior. It is not doubted but that kola exer-

cises a favourable influence on the liver, and that white people living in those regions who chew a small quantity before meals escape constitutional changes due to affections of that organ. Some of the natives believe the nut to have aphrodisiac properties.'

Planters in our colonies, says Mr Christy, who have low damp lands should cultivate this very important tree, as the demand for the nut will increase steadily year by year. It is much more easily cultivated, he says, than the cocoa-plant, and yields a large crop twice a year. It does well in low marshy lands, and gives large crops of fruit in some of our West India Islands. The tree will flourish well at elevations lower than one thousand feet, and even at the sea-level.

MY FIRST TAIL-COAT.

YES; I was just fifteen, the awkward age of fifteen. I remember it well, not because of the fact that I was the possessor of two voices, one a deep bass, and the other a shrill treble; or because I knew that I was considered a general nuisance by everybody; but by reason of certain events happening soon after that time, an account of which I am about to give.

It is at any time sad to return to school, but to do so on one's birthday is peculiarly distressing. This, by accident, was my fate on the fifteenth anniversary of my natal day. Nature had not been lavish to me in many respects. I was a fat, sensitive, somewhat retiring boy, more given to day-dreams and my meals than to my books. Everybody said, 'Willie will not be a tall man'—my father and two elder brothers, I should say, made up eighteen feet nine inches among them—and what everybody says, it is acknowledged, must be right. I think, however, nature, by reason of showing me some small sign of favour, had singled me out as the exception to prove the rule, for, with regard to my proportions, what everybody said turned out to be most decidedly and emphatically wrong.

I have said nature had not been too lavish to me; but let me give her all the credit she deserves. In one respect she had been more than liberal—she had endowed me with an extraordinary head of hair. I often wondered why the outside of my cranium had been so richly furnished. Perhaps it was to make up for internal deficiencies in the same region. Be that as it may, my hair stood alone in more senses than one. In colour it was a rich brown, and it tossed in heavy masses, like the waves of a troubled sea. It acted as a sort of weather-glass, indexing my internal emotions. When I was excited, it would stand out like feathers, giving me the appearance of a bird of plumage. When I was happy it would arrange itself in graceful curls. When I was sad—and I was very sad at the moment of which I am writing, as I got into the train at Paddington—it would hang limp and long, in perfect keeping with the sorrowful soul within.

This was the long summer term, and it was an eventful term for me. I don't think I made much progress with my education; my time was fully occupied in unconsciously proving that everybody was wrong. In fact, this was the term in which I made my 'shoot.' I commenced to

grow rapidly the moment I set foot in the fructifying atmosphere of Somersetshire. I opened out on telescopic principles, and became thinner and longer day by day. At the end of five months there was nothing left of the original 'Willie' but his hair. This flourished with its pristine luxuriance, and gave a palm-tree-like finish to the attenuated trunk, which had so suddenly and unexpectedly matured that the family record of male inches had now reached the gratifying total of twenty-five feet.

Now, as I have before stated, I had returned to school on my birthday. Five months had passed, but the sore was still open. As a salve for this, my father had arranged to meet me at Bristol, and special leave had been granted me for a few days' holiday. When this news came to me, I need not describe my feelings; suffice it to say that my hair took on its most feathery aspect, and remained totally irrepressible and unmanageable. So absorbed was I in making the necessary preparations, that I positively gave up growing.

My first confidante on the subject was the wardrobe woman. 'Lor, Master Willie,' said she, 'and you 'aven't any clothes!'

'No clothes!' said I. 'Can't I go as I am?' I was quite unconscious of the fact that the high-water-mark of my costume had risen considerably. The coat sleeves finished off somewhere about the elbow, while the terminal borders of my nether garments were on friendly terms with the upper edges of my socks. As for the waistcoat and the aforesaid nether garments, they refused to meet on any pretence whatever.

'You write home, sir, and tell them you want some clothes,' said the mistress of the robes. 'Your father would like to see you nicely dressed; and you're old enough now to be out of them jackets.'

True. I had for some time had visions of 'tails,' those insignia of manhood; here was my opportunity. I *did* write home. I will give you the identical letter, as found in the family archives:

DEAR FATHER—The wardrobe woman says I must have a tail-coat, with tails. Please get me one, with tails to wear, when you meet me at the Great Western Bristol Railway Station on next half-holiday week. I am so big I have not any money left. She says you must allow for my growing, with tails.—Your affectionate son, WILLIE.

The next four days were days of fears and hopes, my hair meanwhile alternating between damp hay and forked lightning. At last, at the end of a week a parcel for 'Master Willie' was announced, and my hair took on an erectile condition which threatened to be permanent. Shall I ever forget the opening of that parcel! In the solitude of my own bedroom, with trembling hands I severed the string and tore off the brown paper. Yes, there it was in all its glory—a frock-coat with tails! For a few moments I feasted my eyes on its ample lappets, turned back with silk facings, and let my fingers lovingly stroke its velvet collar, and then, blind with excitement, I tore off the meagre habit that sparsely covered me and plunged madly into my new treasure. What cared I though there was

a pinching sensation under the arms and a general feeling of tightness across the chest! I could feel something flapping in the region of my calves and ankles that assured me the tails were there, and I was happy.

In our school they did not encourage vanity; indeed, the looking-glass accommodation was decidedly limited. I have seen on Sunday mornings as many as six boys dodging in front of one diminutive mirror, and bobbing up and down, brush and comb in hand, in the hope of getting even a distant glimpse of their partings before the bell rang for church parade. These mirrors, which measured about nine inches by six, were generally nailed to the wall about four feet from the ground. I had taken the liberty of hoisting the one in my room up about two feet, and in it I could get a good view of my face, although it never included all the hair at one time. How I flattened my nose on that glass and tried to look down at that moment! But it was useless. The appearance of those tails remained a mystery. Perhaps it was well so.

Whether as the result of hints thrown out in my letter, or information gained from other sources, I know not, but the family tailor had acted up to the full letter of his instructions, and had amply allowed not only for my present increased proportions, but also for endless inches yet to be acquired. As I afterwards learned, those tails were absolutely phenomenal, and a cold shudder creeps down my back at this moment as I recall them.

When I got into that coat, life assumed a new aspect; fresh thoughts and ambitions crowded in upon me; a dawning sense of the correlative fitness of things stole into my mind. Perhaps it was this that inwardly told me that a frock-coat demanded a tall hat. At anyrate, I was exercised in my mind on this point. We didn't wear 'toppers' in my school; such things were unknown. We wore 'mortar-boards' on Sundays; but to go on a holiday in one of these badges of servitude was not to be thought of. I was fairly puzzled. My cricket cap would rarely stay on my head, especially if I was excited, and I was highly excited now. We also used straw hats. But how could I face a loving father in a new frock-coat and a hat whose brim depended from the crown by the very last straw! Forgetting my manhood and my tails, I buried my face in my hands and would have wept, had not a sudden and happy thought arisen.

This was the thought. There was a boy in our school named Hobson. Hobson was in his way quite a natural curiosity, physically I mean: he was all chest and arms. If he was eccentric in appearance, he was equally so in his habits. I don't think I ever saw him on his feet; he was generally found depending from convenient gas-pipes, or working his way along between parallel desks or forms on his hands, with his feet in the air. I forgot to mention his peculiarly small head. Now, when he arrived as a new boy at the beginning of the term, on this diminutive head he wore a trim and shiny tall hat. This circumstance had awakened such a lively interest with regard to the name of Hobson's hatter, and so much solicitude on behalf of some unknown individual who had purloined a member of the canine tribe, that

after courting constant attention for one brief half-hour in the playground, Hobson's hat had been quietly stowed away, and had not since been heard of. On this hat all my hopes now depended. Hastily removing my coat and putting it tenderly in my locker, I hurried off to the gymnasium, where I knew I should find Hobson. As I drew near, I could see him hanging by his toes from a high trapeze, his sloth-like form and small head clearly silhouetted against the sky. As I looked at that tiny head, I felt a sinking sensation in my breast; but nothing daunted, I broached the subject of the hat at once. Without getting down, he told me where the precious headgear was to be found, and added, as he began circling round like a St Catherine's wheel on the 5th of November: 'Shy it away when you're done with it, old fellow.'

With Hobson's hat concealed in a towel, I was soon back again in the seclusion of my bedroom. How shall I describe my interview with that hat! At first it absolutely refused to stick on at all; but at last I conquered by thrusting a handful of my hair into the crown; and after flattening down the remainder at the sides and back, I took a view of as much as could be seen of the whole concern in the small mirror, and felt I had reason for much self-congratulation. I felt vexed that no one witnessed my departure the next day, but I had to leave during morning school-hours to catch the train. I had, however, derived much pleasure from my toilet, and I was filled with pleasant thoughts when I reflected how I should astonish the public. I believe I astonished the public very much. The school omnibus carried me up to our sleepy little station. No Roman warrior ever alighted from his triumphal car more puffed up with pride than did I from that homely vehicle. There was no one about but the station-master and one solitary porter; but I was pleased to find that my costume even here excited attention, for the friendly station-master at once remarked: 'Why, zur, that be a voine coat; and they 'aven't forgot the tails, 'ave 'un!'

'No,' I said; 'I particularly mentioned'—

But the rest of my sentence was lost in an uproarious burst of laughter from the porter, whose dull wit I imagined had just discovered the point of some joke he had heard probably the day before yesterday. However, the train came up at that moment, and I jumped in. I suppose the porter had confided his joke to the station-master, for, as we whizzed off, they both appeared doubled up on the platform in convulsions, threatening apoplexy.

What a happy place Bristol seemed to be; all the people appeared to wear a perpetual grin. The little children shrieked with laughter in the streets, and the older inhabitants chuckled as they walked along. The atmosphere seemed veritably charged with laughing-gas. Having to wait two hours for my father, I walked about seeing all I could and letting myself be seen. I became very dusty and tired, for it was extremely warm. My boots were not all they might have been; the right one was very much down at the heel, and a hole, which had been threatening for some time, suddenly appeared in the sole of the left one, creating a blister on my foot, which caused me to limp perceptibly. I finally found myself

in a common back street in the low part of the town in the middle of quite a noisy crowd. I didn't know what they were looking at, but I heard some references to a long tail; so I stopped, and leaning up against a lamp-post, looked vaguely up into the sky, half expecting to see a comet or some other celestial curiosity. I was too hot and tired to remember that it was still broad daylight. The crowd grew more and more exuberant in their cries, and as I gazed vacantly into the heavens, a policeman touched me on the shoulder and said: 'Now, mister, you'd better move on.'

Yes; he was right; time was flying, and my father's train was nearly due, so I said: 'Thank you. Which is the way to the station?'

'Well,' said he, 'I don't want to take you there; but if you don't move on I'll have to.'

'Oh,' I replied, 'I should be sorry to trouble you.'

But at that moment I got a push from behind that nearly made Hobson's hat lose its balance, and gave me an impetus that carried me to the corner of the street, from which point I luckily caught sight of the railway station. Hearing a whistle, I limped along as well as my blister and my carpet bag—which I had religiously carried all this time—would allow me, and arrived synchronously with the London express which rattled in at that moment.

I eagerly scanned each carriage as it glided by, and once I thought I caught sight of my father's face. Could I have been mistaken? The train emptied its contents, but no father of mine! I could have recognised his colossal proportions a mile off. Hurriedly I rushed along, peering into each deserted carriage. Why were all the passengers and porters roaring with laughter and enjoying themselves while I was so anxious? It was cruel! At last, in the front compartment of all I found my missing parent. He was crouching in the far corner with an expression on his face I can never forget. I leapt in, utterly regardless of Hobson's hat, which received a crunch against the door-sash from which it never fully recovered. 'Father!' said I.—'Willie!' said he. 'Then it is you!' That was all the greeting I got. Seizing me firmly by one arm, he hastily hustled me across the platform, threw me into an unoccupied cab, threw himself after me, pulled up both windows, and ordered the cabman to drive to the nearest hotel.

I was strangely puzzled to account for this altered behaviour on the part of my father. As we drove along, he remained silent and abstracted. He was so unlike his usual self. There was an occasional twitching also at the corners of his mouth which I could not understand. When we arrived at the hotel, he alighted, bidding me remain until he had made all the necessary arrangements. After an interval, a waiter came, and after asking me to descend, ushered me straight through the hall door, up-stairs, to our room.

Our dinner was sent up to us; and as the meal proceeded, my father seemed to brighten up somewhat; but I was tired. The excitement of the previous days was telling upon me; so, after making a cardboard sole for the inside of my left boot, I tumbled into bed and was soon fast asleep.

I will not describe our—well, what shall I call it?—well, ramble through Bristol, for want of a more explanatory word. Wherever we went, we went in cabs. The accumulated cab-drives of years seem as nothing to the number of cab-drives we did in that short visit. I began positively to hate the sight of anything on four wheels. Once a break occurred—somewhere in the region of the celebrated suspension bridge—when my father made me visit a deserted Roman mine, which twisted and turned for some miles, apparently, in the bowels of the earth. My father did not go in himself. What he did while I was away I never knew. For myself I know that I wandered about, carrying a candle stuck on the end of a stick, for an indefinite period, and eventually emerged into the light of day only to find that hateful cab awaiting me, and my father beckoning me to jump in quickly. On the whole, however, I was very happy. The possession of that coat and borrowed hat covered a multitude of minor trials and disappointments.

After cabbng all over Bristol, I remember we found our way to Wells; and as soon as we arrived, a fly was hired to convey us to the cathedral. The fly was an improvement on the cabs, because it was open, but unluckily rain commenced to fall, so I turned up my precious coat-collar to preserve the velvet. My hair, however, got a little damp and bedraggled, and I fancy Hobson's hat, which was still suffering from the effects of the accident at the railway station, acquired an additional measure of limpness. That cathedral was charming; at least I can answer for the interior. I was not allowed to see the outside—'on account of the rain,' my father said; but I know the sun was shining again by that time. I was hurried inside with such unseemly haste that I forgot to turn down my coat collar. I was, however, soon lost in admiration of the time-honoured arches and ancient carvings; and putting Hobson's hat on a chair, I sauntered away on a voyage of inspection. As I was thus engaged, an old gentleman with a party of ladies came and entered into conversation with me. I felt much flattered; and as I had read up my guide-book on the journey from Bristol, I enlarged to them on the various objects of interest, giving the date of the stained glass windows and the history of the tombs with wonderful accuracy. They seemed highly gratified, and as they were leaving, the old gentleman slipped a shilling into my hand. I was fairly puzzled; but with a happy impulse, I thrust it into the dainty hand of one of the ladies on whom I thought I had made some impression. She smiled sweetly, and handed it again to her father. He looked first at me, then at the shilling, and then again at me, and then *he* smiled also. Then I smiled; in fact, we all smiled. Then they departed, the old gentleman muttering something about a 'model verger,' and leaving me mystified to such a degree that I was barely conscious of the fact that my father had suddenly emerged from behind a column and caught me by the wrists and was saying something about 'going to the crypt.'

I did not want to go to the crypt; recollections of that Roman mine still lingered. Once there, however—and we got there with remarkable ex-

pedition—I felt really happy. My father seemed kinder to me in that dark retreat. A little of his old self had returned; he even came and put his arm round me and spoke of home. I was glad it was dark at that moment. But when we ascended into the daylight once more, I could again see that weird, unaccountable expression and that mysterious twitching at the angles of his mouth. I found an elderly lady sitting on Hobson's hat; and after apologising for troubling her, we left the cathedral and re-entered the fly.

I do not remember exactly where we went to next; but I know we eventually found ourselves at a place on the banks of the Severn, whence we were to start on board a steamer, with the intention of visiting Chepstow. It was a splendid crossing. It was windy, but the sun shone brightly. My father, who always boasted of being a splendid sailor, retired to the cabin, and resisted all persuasion on my part to tempt him to come up on deck. For myself, I determined the passengers should not be deprived of my presence. I would have 'walked the bridge' all the way, had I not been too much occupied in chasing Hobson's hat about the deck; every lurch of the vessel sent it off; once, a sudden gust of wind carried it down amongst the machinery, where it alighted on a piston, and rose up and down, greatly to the delight of the passengers, until it was fished out on the end of a boat-hook. Another time it was blown through the skylight into the cabin and fell on my father, who was just dozing off to sleep. He seemed very much vexed; but the passengers and crew filled the air with their shouts of delight. The ailing ones even forgot their qualms. They were a jolly lot. My father seemed the only one on board with a vein of sadness in him. This distressed me; it was so unnatural to him to be thus.

When we reached Chepstow, he was positively angry, simply because there were none but open flies for hire. We drove direct to the castle. He seemed anxious that I should see everything, and insisted on my climbing to the tops of all the towers and clambering over every inch of the ancient walls. He remained outside. Standing on those battlements, my tails fluttered gloriously in the wind, and I felt I was an object of marked admiration for a crowd of rustics who had assembled below. Looking down, I could see my father smoking his cigar on a grass plot apart. At that moment Hobson's hat blew off, and after quivering in the air for a brief space, like a wounded bird, it fell on the grass at my father's feet. He started as though he had been shot, and I actually saw him give it an unkind thrust with his umbrella. I followed Hobson's hat, not by the same route, however; and when I reached that grassy plot, my father was on his feet. There was a fixed look in his eye. Casting one anxious glance towards the crowd, which was now drawing near, he placed his hand on my furze-bush head and said, not unkindly, but firmly: 'Willie, I can stand this no longer; we must return to Bristol at once.'

That return journey was not a happy one; I could not tell why. I seemed to have lost my buoyancy, and positively shuddered as we again entered one of those nightmare cabs at Bristol

and drove, this time, to the *Grand Hotel*. I could have kicked that phalanx of grinning housemaids and strangled those cynical-looking waiters with their own white chokers. What were they all 'sniggering' at?

With an air of haughty disdain, I marched up the broad brilliantly lighted staircase. Great heavens! what was that extraordinary figure that gradually appeared before me?—first the head, then the body, and then what ought to have been the legs. My first impulse was to laugh outright; but that would not have been a sufficiently dignified proceeding for an individual wearing a frock-coat and a tall hat. I looked again. There it stood, measuring at least six feet three in height, but lamentably attenuated. On its head it wore a disreputable thing that might once have been a silk hat, but so small that it looked more like a thimble on a telegraph pole than anything else. The figure's hair was wildly tossed, and stood out in forked masses on either side. The body was short and pinched. The lower extremities were completely concealed by a cassock-like skirt that reached almost to the ground, leaving exposed only a short expanse of red striped stocking, and a pair of shabby boots. I felt a queer sensation creeping over me, and a fascination that prompted me to look and look again. I unbuttoned my coat for air; the ghastly apparition unbuttoned *his*, displaying *my* waistcoat! I knew it by its peculiar pattern, and realised that that spectre was none other than the reflection of myself in the staircase mirror! I gathered myself together, and rushed out into the darkness.

Late that night, my father, now melted towards me, persuaded me to take shelter in a humble and sequestered hostelry, and I returned to school early the next morning, and slunk in unobserved.

I don't know what was the ultimate end of Hobson's hat. As for my coat, although the judicious use of the sartorial shears rendered it a tolerably presentable garment, and furnished me with material for waistcoats for some time to come, I have ever since that hour been possessed by an unconquerable horror of anything approaching to a frock-coat, and consequently always appear in 'tweeds.'

A FEW EXPERIMENTS WITH THE GARDEN SPIDER.

THE Garden Spider (*Epeira diadema*) is one of the most beautiful, in form and colour, of the many hundred species we have in England. The manner in which it spins its web—certainly the most regular in make—displays great ingenuity in the way the web is secured to sustain a sudden strain coming on any part of it. We have been watching several experiments with this spider, of which the following are a few of the most interesting.

Having an old fern-case, with sides and top all glass, we filled the bottom with earth, placing a few sticks firmly in the soil, so that the spiders would have some projections to secure their webs to. The first spider we placed in the case was a very fine specimen, nicely marked on the top of the abdomen. We took her from an old laurel tree, in which there were several young ones. The first day she remained crawling

about on the ground ; but on looking next morning, we found a perfect web, spun horizontally across the case, about half-way up ; and on magnifying the ends of the web that were fastened to the glass—which was very smooth—we discovered the spider had frayed out the ends of the web-lines, and had fastened them to the glass by means of a gummy substance, thus giving it a greater power of adhesion than by trusting to a single cord. We placed a small house-fly in the case, where it soon became entangled in the web, the spider immediately rushing down, seizing, and killing it. She then carried it to the top of the glass, and in four minutes had sucked all the moisture out of it. She then wrapped it loosely round with web, leaving only one line to it, by which she carefully lowered it, for about two inches, through a space in the net ; then, cutting the line with her hind-feet, she let it fall to the ground.

After this we placed four flies in the case, three of which were speedily caught. The spider having evidently eaten enough, she disposed of these flies in a different manner from the first. Running to each in turn, she turned the fly rapidly round and round with her front legs ; at the same time, two distinct webs kept winding round the fly from the spinnerets, until it was encased in such a bag of web that the fly could not be seen. She then hung them in different parts of the web, eating two of them the same night. Thinking the flies so wrapped up would be air-tight, we detached one from the web, leaving it exposed to the air for three days. Although the weather was very hot, we found, on carefully opening the case, that the dead fly was quite fresh, and when smashed between the fingers, was in a perfectly juicy condition. This clearly shows their wonderful instinct in preserving food for future meals.

One day we placed in the case a large meat-fly, which immediately flew through the web, tearing it in a destructive manner. The spider at once came down and repaired it ; and in a few minutes the fly was once more in the web, struggling hard. This time, the spider came within about half an inch of the fly, made a strong cord fast to three of the outside lines of the net, and then running quickly over the back of the fly, she made the cord fast on the other sides. On this cord we noticed tiny beads hanging, of a clear-looking substance, which, as the fly struggled, adhered to its wings, impeding its movements. Leaving the fly for nearly two minutes, by which time he was almost exhausted, the spider once more drew near, and quickly had him by the back. Swaying her body from side to side at the same time, she soon bound him with three cords, which she guided about over the fly with her hind-feet in a wonderfully rapid manner. She then pierced him on the side of the trunk, from which place she did not again loose until the fly was dead. Making a slight repast, she bound the remains securely in the web, for future meals. This same spider we have now. Last September she completely destroyed her web, and spun a bright yellow cocoon on the top of the glass, and laid, as near as we have yet examined, about three hundred and sixty eggs. She has since then remained hanging on this cocoon. Her body before she laid the eggs was as large as a small

bean ; it is now (January) not much larger than a grain of rape-seed. She refuses all food, and appears in a dormant, if not a dying state.

There was another old spider, of very dusky colours, which we placed in a large glass jar. Although he was a very large one, he did not erect any web, but used to try and catch the flies we placed in the jar by sneaking round the glass to them while they were resting. A few days after, we introduced a younger spider, about three parts grown, which quickly made a very strong and useful web. The old spider took no notice of the newcomer until the younger spider had completed his home and made all comfortable. Then the old one carefully climbed into the net or web, attacked and killed the owner, and took possession. After this, we placed several flies in the jar, some of which injured part of the web, the spider not attempting to repair the damage, not being able evidently to produce web, through old age or injury. To show the power spiders have of knowing what insects they can safely attack, we placed two large ants, which were neuters or workers, in a web. When the spider came down and saw who the visitors were, he fell from the web to the bottom of the jar, where he lay seemingly paralysed with fear. We then removed the ants. The spider did not return to his web for thirty-five minutes, and then in a cautious, and apparently frightened state.

We used to feed a female spider with a fly every morning ; and she became so used to the habit, that at last, when we shook the net, she would come and take the fly from between our fingers. Unfortunately, she died at the end of the season, after laying a cocoonful of eggs.

In experimenting in different ways with some of the small insects, many hours may be pleasantly spent, greatly adding a rich store of knowledge as to the way in which all things are endowed according to their nature of living.

THE WITNESSES.

Day by day in the open meadows,
The cowslips swing their bells of gold ;
And the young leaves throng, like merry children,
The forest windows grim and old.

Day by day, with a blow that strengthens,
The sun-god smites the springing corn ;
Doubly cool are the dews of evening,
Doubly sweet is the breath of morn.

Day by day in the lower pastures,
Heavier mists at twilight fall,
The sheaves stand thick on the short white stubble,
The peaches glow on the orchard wall.

Day by day, over hill and valley,
The snowflakes wing their passage slow,
Cold white ghosts of the forest children
Dead in the tangled brakes below.

CLOVELLY.

NATURE has made and kept Clovelly unique. Fixed in a narrow North Devonshirecombe, in which it existed at least when Domesday Book was compiled, and which, from the evident age of its houses, it has filled to its extreme capacity for five hundred years and more, further growth was all but impossible. Nestling under its limestone cliffs, the Atlantic storms sweep clean over the little village and leave it scathless. The lands above are mostly a wide windswept moor, no stick of timber being able to hold up its head against the ocean blasts. The jutting rocks to the northward shelter little gorges where trees luxuriate; but wherever they peep above the friendly crag they are dwarfed, twisted, gnarled, contorted, and bleached into a thousand grotesque forms and colours unknown to tree-life elsewhere. The nearest railway approach is at Bideford, whence a drive of some ten miles gradually leads through the luxuriance of a Devonshire landscape to a treeless table-land, its widest contrast. The most expeditious and time-saving conveyance is the two-horse mail wagonette leaving Bideford at six in the morning, and, when in a little more than mid-journey, skirting the cliffs of Clovelly on its way to Hartland—as hungry a drive over the moorland as can easily be found, but not destitute of contrasts and surprises. Talk of fresh air!—here it is certainly to be had in its most untainted form.

Within two miles of Clovelly the horses are suddenly pulled up, and the travellers informed that for the small contribution of fourpence each, demanded by the fair owner towards a pension fund for her old retainers, the mail will leave the highway and drive through her Hobby Woods down the most picturesque of roads, cut, according to Lysons, in 1822. These are glorious woods, the timber grand, and the undergrowth one which Devonshire alone can produce. One enthusiastic fern-writer speaks of a fern paradise: surely this is it. But undergrowth the ferns are not, for they swarm up the trees, nestling in their

moss-grown trunks and perching on their boughs; indeed, it would be hard to say where the venturous little polypody is not to be found. After zigzagging and careering some mile down through the overshadowing trees, you in a moment emerge into the open, and the vehicle stops, that you may feast on a suddenly revealed fairy scene. There below, a mile or more away, lies Clovelly, with its tiny pier and sheltered harbour pool, a scene of sunny enchantment. After a few moments of this feast of contrasts, you plunge again into the gloomy wood, and career some mile farther, when the vehicular journey comes suddenly to an end, and with no apparent reason, for where is Clovelly? Not a trace of it is to be seen; and you dismount in the middle of the high-road, amongst groups of oddly caparisoned donkeys, and men with hand-sleighs, a motley arrangement never before seen, and now not understood. 'New Inn, gentlemen!' shout the donkey and sleigh men; and choosing the latter, the luggage is promptly packed on the sleigh, and rattles down the steep road, impassable of wheels, descending at a run to the hostel in the middle of the village.

Clovelly bursts on the view just as you spy the first and topmost cottage, embowered in tree-like fuchsias and rollicking Virginian creepers. The steep road leads here to a sort of landing-stage, where the heavier things, slid down the abrupt incline, are temporarily deposited, and whence they are distributed. Heavy balks of timber for building repairs—no new erections being permitted—and other weighty matters, here find a temporary resting-place. Lime, burnt near the harbour, bricks, coals, and all such-like matters are carried up thence by donkeys in their capacious panniers, made for the work, this being the only practicable mode of conveyance up the steep inclines and shallow steps. Donkeys, too, carry up the luggage of departing visitors to the point whence it was first sleighed or panniered down, and here meet the public conveyances pursuing their journey north-west to Hartland, or south-east to Bideford.

The main street, from the little landing-stage at its head to the bend which bounds the view downwards, is paved with boulders, which are universal here; and for the most part it is too steep to descend except by steps, still formed of boulders, varied in width and depth with the changing gradient. The houses bounding the road are alike in one thing—they are all old—varying, it is believed, up to a period of eight hundred years or more, Domesday Book affording collateral proof. The constant repairing, remodeling, patching, and extending result in endless variety and diversity. The abrupt descent makes a curious little terrace necessary in the front of the larger dwellings, with a drop at its lower end of from five to ten feet, as the degree of descent dictates, and a balcony becomes necessary for safety, whilst forming an important and picturesque feature of the street view. Creepers grow here, not of compulsion, but of choice, and their profusion changes the humblest cot into a little bower. Of the two sections into which the main street is cut by the bend in the middle, perhaps the lower portion, whilst least steep, is most picturesque.

The North Hill runs at right angles to the main thoroughfare up a very steep acclivity, bordered by cottages of a still more ancient and primitive type. Rising in successive terraces, with flights of steps between, picturesque with all kinds of accretions and side-growths, little flower-gardens intervening in odd corners, the tiny dwellings are out-topped by one claiming seniority, and abandoned as no longer tenable through age. Time and the elements are evidently too much for the maxim of Clovelly Court—'Nothing new in Clovelly.' The houses here 'grewed,' were not built; and modern medievalism producing all its choicest revivals, would be incapable of anything enduring on the spot. There could be no Acropolis but at Athens, no Colossus except at Rhodes, and as certainly nothing but one of its home-grown cottages on the North Hill. Beyond this decaying topmost cottage, the path becomes a long series of steep steps, deep worn into the hillside, and thickly overhung for a distance with the boughs of the shrubs and trees which skirt it. It is quite a relief to emerge from this gloomy arcade upon the bright little plateau at the top, with its divergent paths, one leading round again to the village head, another to Clovelly Court, and a third making a circuit right down to the harbour.

A little-used path leading from the main street in an opposite direction to the North Hill passes a curious door in the hillside, whereby hangs a tale. This odd door is said to lead to a large subterranean vault with a perennially damp floor, the scene of many a smuggler's venture in the old days, when not only kegs of brandy but bags of salt were worth running, and depositing till safely disposable. Rumour has it that there are many such subterranean receptacles in and

around Clovelly. Possibly Kingsley knew of them, and based on this knowledge the thrilling story of the hidden treasure in the shore-cave of Aberlva. This footpath pursued leads into all the wild luxuriance of the lower portion of the Hobby Wood; and pursued still further, conducts to a charming summer-house on the rocks overlooking Clovelly Bay, as well as the wider waters around.

Returning to the main street, we proceed seawards, and in a few steps come to Lookout Hill, with its flagstaff for use on days of mark, and its broad capacious seat for all the gossips and yarn-spinners of the place. Our ancient nautical friend here can tell of hairbreadth escapes in shooting Old London Bridge during his apprenticeship to a London shipping firm—dangers more than imaginary, seeing the upper pool was generally six feet above the level of the lower, and the current through the narrow arches one not to be braved by any boat or bargeman lacking a steady eye and a stout hand. But the tales of Lookout Hill extend to wider fields: the Mediterranean ports and harbours, with Constantinople itself, are minutely discoursed upon; the fisheries of Labrador are described; and some old man-of-war's man may show the wider circle known to the British navy familiar ground to himself. A friendly marine glass is at the general service for scanning the home-craft in Barnstaple Bay, and the more distant and larger vessels bound to far-off foreign ports. It is soon evident that the fine race of seamen here mostly spend their apprenticeship, and, in not a few cases, all their more vigorous days, in distant service, and only come back to the old nest when pretty well worn out, or only fit for the milder pursuits of the bay fishery, touched with the common yearning, 'Here to return and die at home at last.'

Now we must go 'down along' a steep demanding precipitous steps, or a constant zigzag, the left way leading to the pier; the right to the life-boat house, the waterproofing shed for fishing-nets, and the shore drying-ground for newly oiled light nets. At every turn in either path the eye catches the most quaint and picturesque groups of houses, hanging as in mid air one above another. The lowest tier of dwellings is built on the very seawall, and with local characteristics all its own.

After all, the pier and harbour are chief features of interest in Clovelly, and hither all visitors naturally tend. The pier was erected, or improved, according to Williams, in 1804; but according to local tradition, backed by appearances, it is of much more ancient origin. It is formed entirely of boulders thrown up in a constant stream on the shore of the whole bay. Built in a curve, with its round back to the open Atlantic, the sturdy little pier braves the wildest weather, sheltering, in the harbour pool it embosoms, the fishing-boats of the port with their nautical belongings. The pier is, too, the chief promenade, its outer and higher wall, some eight feet broad at top, forming the fair-weather walk, though destitute of any railings or defence on either side. Stormy weather renders this higher walk speedily untenable, and drives the promenaders to the lower and wider one on the

inner side, which is perfectly sheltered from the Atlantic winds. Primitive steps connect the upper and lower promenades, and ladders clasp the inner wall leading down to the vessels in the harbour pool. The horizontal poles on which the fishing-nets hang to dry in all directions on the pier form a curious but characteristic feature of the scene, whilst the pier light and its elevated stage form the complement and finish of the scene.

The sailors say the boulders with which the shore is strewn come steadily up from Hartland Point, work their way past Clovelly harbour in a clearly defined stream, and continue their course round Bideford Bay, as marked stones are traced through the whole route. There is a constant trade in these big pebbles, which are shipped in the harbour almost daily.

But Clovelly is before all things a fishing town, and its herrings are traditionally the earliest and the best. A considerable fleet of trawlers fishes the entire Bideford Bay, which the native sailors look on jealously as their own ground, and from it they bring in at all periods a supply of the season's fish. The proprietary rights of Clovelly Court, now the seat of Miss Fane, are exercised in a mild and gentle fashion, and the old fixed proportion of the fish brought into the port claimed in former times, seems to be exchanged for a daily supply to the manorial table. The dangerous coast here has the worst character with mariners of any round the island, and is guarded by a lighthouse, placed above the village, whose warnings are aided by a double foghorn; and this tiny harbour, with capacity only for trawlers, is the only refuge between Padstow and Bideford. A light, just mentioned, has recently been erected at the end of the pier, to guide the fishermen running home in the dark, when the narrow entrance is hard to make, specially in heavy weather.

No corporate town is better drained or has a better supply of water than this out-of-the-world village, while an air of easy comfort everywhere prevails. The reigning policy is to keep Clovelly as it has so long been, free from all modern innovations; and the most progressive visitor must own the sweet calm and restfulness that result. The worst inroad is made by an almost daily summer steamer from Barnstaple or Ilfracombe, but the shoal of visitors it brings is dependent on the tide, and must leave when the steamer's peremptory bell summons them aboard. Clovelly Court, already spoken of as the historic seat of the owners of the village and its surroundings, has descended through a long ancestral line to the present owner, whose gentle rule is everywhere evident. This, the proprietary house, is situated in a noble park on the tableland above the village, abounding with picturesque and varied views, and much sheltered by depressions of the surface from the Atlantic storms. The wooded walks, with here and there a welcome seat, the most ambitious of which is 'Gallantry Bower,' three hundred and sixty feet above the sea, are unsurpassed for their delightful coast, ocean, and inland scenery. The coast is bold and picturesque to a degree; whilst the heather on the tableland above is as brilliant as nature's pencil under the light of the most brilliant sun can make it. Clovelly Park is

indeed the complement of Clovelly village, and the sheltered softness of the one, combined with the breezy openness of the other, forms a charming and perfect whole.

THIS MORTAL COIL.

CHAPTER XXVI.—REPORTING PROGRESS.

WARREN RELF spent many days that summer at Whitestrand, cruising vaguely about the mouth of the Char, or wandering and sketching among the salt-marsh meadows; but he never happened to come face to face, by accident or design, with Hugh Massinger. Fate seemed persistently to interpose between them. Once or twice, indeed, Winifred said with some slight asperity to her husband, 'Don't you think, Hugh, if it were only for old acquaintance' sake, we ought to ask that creature Relf some day to dinner?'

But Hugh, who was yielding enough in certain matters, was as marble here: he could never consent to receive his enemy, of his own accord, beneath his own roof—for Whitestrand, after all, was his own in reality. 'No,' he growled out, looking up from his paper testily. 'I don't like the fellow. I've heard things about him that make me sorry I ever accepted his hospitality. If you happen to meet him, Winifred, prowling about the place and trying to intercept you, I forbid you to speak to him.'

'You forbid me, Hugh?'

'Yes'—coldly—'I forbid you.'

Winifred bit her lip, and was discreetly silent. No need to answer. Those two proud wills were beginning already to clash more ominously one against the other. 'Very well,' the young wife thought in silence to herself; 'if he means to mew me up, seraglio and zenana fashion, in my own rooms, he should hire a guard and some Circassian slaves, and present me with a *yashmak* to cover my face with.'

A day or two later, as she strolled on some errand into the placid village, she came suddenly upon Warren Relf, in his rough jersey and sailor cap, hanging about the lane, sketch-book in hand, not without some vague expectation, as Hugh had said, of accidentally intercepting her. It was a painful duty, but Elsie had laid it upon him; and Elsie's will was law now. Naturally, he had never told Elsie about the meeting with Hugh at the Cheyne Row Club. If he had, she would never have imposed so difficult, delicate, and dangerous a task upon him. But she knew nothing; and so she had sent him on this painful errand.

Winifred smiled a frank smile of recognition as she came up close to him. The painter pulled off his awkward cap awkwardly and unskillfully.

'You were going to pass me by, Mr Relf,' she said, with a good-humoured nod. 'You won't recognise me or have anything to do with me, perhaps, now I'm married and done for!'

The words gave him an uncomfortable thrill; they seemed so ominous, so much truer than she thought them.

'I hardly *did* know you,' he answered with a forced smile. 'I've not been accustomed to see you in black before, Mrs Massinger.—And to say

the truth, when I come to look at you, you're paler and thinner than when I last met you.'

Winifred coughed—a little dry cough. Women always take sympathetic remarks about their ill health in a disparaging sense to their personal appearance. 'A London season!' she answered smiling; yet even her smile had a certain unwonted air of sadness about it. 'Too many of Mrs Bouverie Barton's literary evenings have unhinged me, I suppose. My small brains have been overstimulated.—You've not been up to the Hall yet to see us, Mr Relf. I saw the *Mud-Turtle* come ploughing bravely in some three or four days ago, and I wondered you'd never looked up old friends.—For of course you know I owe you something: it was you who first brought dear Hugh to Whitestrand.'

How Warren ever got through the remainder of that slippery interview, gliding with difficulty over the thin ice, he hardly knew. He walked with Winifred to the end of the lane, talking in vague generalities of politeness; and then, with some lame excuse of the state of the tide, he took a brusque and hasty leave of her. He felt himself guilty for talking to her at all, considering the terms on which he stood with her husband. But Elsie's will overrode everything. When he wrote to Elsie, that letter he had looked forward to so long and eagerly, it was with a heavy heart and an accusing conscience; for he felt somehow, from the forced gaiety of Winifred's ostentatiously careless manner, that things were not going quite so smoothly as a wedding-bell at the Hall already. That poor young wife was ill at ease. However, for Elsie's sake, he would make the best of it. Why worry and trouble poor heart-broken Elsie more than absolutely needful with Winifred's possible or actual misfortunes?

'I didn't meet your cousin himself,' he wrote with a very doubtful hand—it was hard to have even to refer to the subject at all to Elsie; 'but I came across Mrs Massinger one afternoon, strolling in the lane, with her pet pug, and looking very pretty in her light half mourning, though a trifle paler and thinner than I had yet known her. She attributes her paleness, however, to too much gaiety during the London season and to the late hours of our Bohemian society. I hope a few weeks at Whitestrand will set her fully up again, and that when I have next an opportunity of meeting her, I may be able to send you a good report of her health and happiness.'

How meagre, how vapid, how jejune, how conventional! Old Mrs Walpole of the vicarage herself could not have worded it more baldly or more flabbily. And this was the letter he had been burning to write: this the opportunity he had been so eagerly awaiting! What a note to send to his divine Elsie! He tore it up and wrote it again half-a-dozen times over, before he was finally satisfied to accept his dissatisfaction as an immutable, inevitable, and unconquerable fact. And then, he compensated himself by writing out in full, for his own mere subjective gratification, the sort of letter he would have liked to write her, if circumstances permitted it—a burning letter of fervid love, beginning, 'My own darling, darling Elsie,' and ending, with hearts and darts and tears and protestations, 'Yours ever devotedly and lovingly, WARREN.' Which done, he burned the second genuine letter in a solemn

holocaust with a lighted fusee, and sent off that stilted formal note to 'Dear Miss Challoner' with many regrets and despondent aspirations. And as soon as he had dropped it into the village letter-box, all aglow with shame, the *Mud-Turtle* was soon under way, with full canvas set, before a breathless air, on her voyage once more to Lowestoft.

But Winifred never mentioned to Hugh that she had met and spoken to 'that creature Relf,' with whom he had so sternly and authoritatively forbidden her to hold any sort of communication. That was bad—a beginning of evil. The first great breach was surely opening out by slow degrees between them.

A week later, as the yawl lay idle on her native mud in Yarmouth harbour, Warren Relf, calling at the post-office for his expected budget, received a letter with a French stamp on it, and a post-mark bearing the magical words, 'St Martin de Lantosque, Alpes Maritimes,' which made his quick breath come and go spasmodically. He tore it open with a beating heart. 'Dear Mr Relf,' it said simply—'How very kind of you to take the trouble of going to Whitestrand and sending me so full and careful an account of dear Winifred. Thank you ever so much for all your goodness. But you are always kind. I have learnt to expect it.—Yours very sincerely, ELSIE CHALLONER.'

That was all: those few short words; but Warren Relf lived on that brief note night and morning, till the time came when he might return once more in his small craft to the South and to Elsie.

When he did return, with the southward tide of invalids and swallows, Elsie had left the first poignancy of her grief a year behind her; but Warren saw quite clearly still, with a sinking heart, that she was true as ever to the Hugh that was not and that never had been. She received him kindly, like a friend and a brother; but her manner was none the less the cold fixed manner of a woman who has lived her life out to the bitter end, and whose heart has been broken once and for ever. When Warren saw her, his soul despaired. He felt it was cruel even to hope. But Edie, most cheerful of optimists, laughed him to scorn. 'If I were a man,' she cried boldly, and then broke off. That favourite feminine aposiopesis is the most cutting known form of criticism. Warren noted it, and half took heart, half desponded again more utterly than ever.

Still, he had one little buttress left for his failing hopes: there was no denying that Elsie's interest in his art, as art, increased daily. She let him give her lessons in water-colours now, and she watched his own patient and delicate work with constant attention and constant admiration, among the rocks and bays of the inexhaustible Riviera. During that second sunny winter at San Remo, in fact, they grew for the first time to know one another. Warren's devotion told slowly, for no woman is wholly proof in some lost corner of her heart against a man's determined and persistent love. She could not love him in return, to be sure: O no; impossible: all that was over long ago, for ever: an ingrained sense of womanly consistency barred the way to love for the rest of the ages. But she liked him immensely; she saw his strong points; she

admired his earnestness, his goodness, his singleness of purpose, his worship of his art, and his hopeless and chivalrous attachment to herself into the bargain. Its very hopelessness touched her profoundly. He could never expect her to return his love; of that she was sure; but he loved her for all that; and she acknowledged it gratefully. In one word, she liked him as much as it is possible for a woman to like a man she is not and cannot ever be in love with.

'Is that right yet, Miss Challoner?' Warren asked one day, with a glance at his canvas, as he sat with Edie and Elsie on the deck of the *Mud-Turtle*, painting in a mass of hanging ruddy-brown seaweed, whose redness of tone Elsie thought he had somewhat needlessly exaggerated.'

'Why "Miss Challoner?"' Edie asked with one of her sudden arch looks at her brother. 'We're all in the family, now, you know, Warren. Why not "Elsie?"' She's Elsie of course to all the rest of us.'

Warren glanced into the depths of Elsie's dark eyes with an inquiring look. 'May it be Elsie?' he asked, all tremors.

She looked back at him frankly and openly. 'Yes, Warren, if you like,' she said in a simple straightforward tone that disarmed criticism. The answer, in fact, half displeased him. She granted it too easily, with too little reserve. He would have preferred it even if she had said 'No,' with a trifle more coyness, more maidenly timidity. The half is often better than the whole. She assented like one to whom assent is a matter of slight importance. He had leave to call her Elsie in too brotherly a fashion. It was clear the permission meant nothing to her. And to him it might have meant so much, so much! He bit his lip, and answered shyly, 'Thank you.'

Edie noted his downcast look and his suppressed sigh. 'You goose!' she said afterwards. 'Pray, what did you expect? Do you think the girl's bound to jump down your throat like a ripe gooseberry? If she's worth winning, she's worth waiting for. A woman who can love as Elsie has loved can't be expected to dance a polka at ten minutes' notice on the mortal remains of her dead self. But then, a woman who can love as Elsie has loved must love in the end a man worth loving.—I don't say I've a very high opinion of you in other ways, Warren. As a man of business, you're simply nowhere; you wouldn't have sold those three pictures in London, you know, last autumn if it hadn't been for your amiable sister's persistent touting; but as a marrying man, I consider you're *Al*, eighteen carat, a perfect hundred-guinea prize in the matrimonial market.'

Before the end of the winter, Elsie and Warren found they had settled down into a quiet brotherly and sisterly relation, which to Elsie's mind left nothing further to be desired; while to Warren it seemed about as bad an arrangement as the nature of things could easily have permitted.

'It's a pity he can't sell his pictures better,' Elsie said one day confidentially to Edie. 'He does so deserve it; they're really lovely. Every day I watch him, I find new points in them. I begin to see now how really great they are.'

'It is a pity,' Edie answered mischievously. 'He must devote his energies to the harmless necessary pot-boiler. For until he finds his

market, my dear, he'll never be well enough off to marry.'

'O Edie, I couldn't bear to think he should sink to pot-boiling. And yet I should like to see him married some day to some nice good girl who'd make him happy,' Elsie assented innocently.

'So should I, my child,' Edie rejoined with a knowing smile. 'And what's more, I mean to arrange it too. I mean to put him in a proper position for asking the nice good girl's consent. Next summer and autumn, I shall conspire with Mr Hatherley to boom him.'

'To what?' Elsie asked, puzzled.

'To boom him, my dear. *B, double o, m*—boom him. A most noble verb, imported, I believe, with the pickled pork and the tinned peaches direct from Chicago. To boom means, according to my private dictionary, to force into sudden and almost explosive notoriety.—That's what I'm going to do with Warren. I intend, by straightforward and unblushing advertising—in short by log-rolling—to make him go down next season with the money-getting classes as a real live painter. Their gold shall pour itself into Warren's pocket. If he wasn't a genius, I should think it wrong; but as I know he is one, why shouldn't I boom him?'

'Why not, indeed?' Elsie answered all unconscious. 'And then he might marry that nice good girl of yours, if he can get her to take him.'

'The nice good girl will have to take him,' Edie replied with a nod.—'When I put my foot down, I put it down. And I've put it down that Warren shall succeed, financially, artistically, and matrimonially. So there's nothing more to be said about it.'

And indeed when Warren returned to England in the spring, to be boomed, it was with distinct permission this time from Elsie to write to her as often and as much as he wanted—in a strictly fraternal and domestic manner.

CHAPTER XXVII.—ART AT HOME.

That same winter made a sudden change in Hugh Massinger's financial position. He found himself the actual and undoubted possessor of the manor of Whitestrand. Winter always tried Mrs Meysey. Like the bulk of us nowadays, her weak points were lungy. Of late, she had suffered each season more and more from bronchitis, and Hugh had done his disinterested best to persuade her to go abroad to some warmer climate. His solicitude for her health, indeed, was truly filial, and not without reason. If she chose Madeira or Algiers or Egypt, for example, she would at least be well out of her new son's way for six months of the year; and Hugh was beginning to realise, as time went on, a little too acutely that he had married the estate and manor of Whitestrand with all its encumbrances, a mother-in-law included; while if, on the other hand, she preferred Nice or Cannes or Pau, or even Florence, or any nearer continental resort, they would at anyrate have an agreeable place to visit her in, if they were suddenly summoned away to her side by the telegraphic calls of domestic piety. But Mrs Meysey, true metal to the core, wouldn't hear of wintering away from Suffolk. She clung

to Whitestrand with East Anglian persistence. Where was one better off, indeed, than in one's own house, with one's own people to tend and comfort one? If the March winds blew hard at the Hall, were there not deadly Mistrals at Mentone and gusts of foggy Föhn at dreary Davos Platz? If you gained in the daily tale of registered sunshine at Hyères or at Bördighera, did not a superabundance of olive oil diversify the stews at the table-d'hôte, and a fatal suspicion of Italian garlic poison the *fricandeaus* of the second breakfast? Mrs Meysey, in her British mood, would stand by Suffolk bravely while she lived; and if the hard gray weather killed her at last, as it killed its one literary apologist in our modern England, she would acquiesce in the decrees of Fate, and be buried, like a Briton, by her husband's side in Whitestrand churchyard. Elizabethan Meyseys of the elder stock—in frilled ruffs and stiff starched head-dresses—smiled down upon her resolution from their niched tomb in Whitestrand church every Sunday morning: never should it be said that this, their degenerate latter-day representative, ran away from the east winds of dear old England to bask in the sunlight at Malaga or Seville, among the descendants of the godless Armada sailors, from whose wreckage and pillage those stout old squires had built up the timbers of that very Hall which she herself still worthily inhabited.

So Mrs Meysey stopped sturdily at home; and the east wind wreaked its vengeance upon her in its wonted fashion. Early in March, Winifred was summoned by telegram from town: 'Come at once. Much worse. May not live long. Bring Hugh with you.' And three weeks later, another fresh grave rose eloquent in Whitestrand churchyard; and the carved and painted Elizabethan Meyseys, smiling placidly as ever on the empty seat in the pew below, looked forward with confidence to the proximate addition of another white marble tablet with a black epitaph to the family collection in the Whitestrand chancel.

The moment was a specially trying one for Winifred. A month later, a little heir to the Whitestrand estates was expected to present himself on the theatre of existence. When he actually arrived upon the stage of life, however, poor frail little wail, it was only just to be carried across it once, a speechless supernumerary, in a nurse's arms, and to breathe his small soul out in a single gasp before he had even learnt how to cry aloud like an English baby. This final misfortune, coming close on the heels of all the rest, broke down poor Winifred's health terribly. A new chapter of life opened out before her. She ceased to be the sprightly, lively girl she had once been. She felt herself left alone in the big wide world, with a husband who, as she was now beginning to suspect, had married her for the sake of her money only, while his heart was still fixed upon no one but Elsie. Poor lonely child: it was a dismal outlook for her. Her soul was sad. She couldn't bear to brazen things out any longer in London—to smile and smile and be inwardly miserable. She must come back now, she said plaintively, to her own people in dear old Suffolk.

To Hugh, this proposition was simply unendurable. He shrank from Whitestrand with a deadly shrinking. Everything about the estate

he had made his own was utterly distasteful to him and fraught with horror. The house, the grounds, the garden, the river—above all, that tragic, accusing poplar—were so many perpetual reminders of his crime and his punishment. Yet he saw it would be useless to oppose Winifred's wish in such a matter—the whole idea was so simple, so natural. A Squire ought to live on his own land, of course: he ought to occupy the ancestral Hall where his predecessors have dwelt before him for generations. Had not he himself fulminated in his time in the gorgeous periods of the *Morning Telephone* against the crying sin and shame of absenteeism? But if he went there, he could only go on three conditions. The Hall itself must be remodelled, redecorated, and refurnished throughout, till its own inhabitants would hardly recognise it: the grounds must be replanted in accordance with his own cultivated and refined taste: and last of all—though this he did not venture to mention to Winifred—by fair means or by foul, the Whitestrand poplar—that hateful tree—must be levelled to the soil, and its very place must know it no longer. For the first two conditions he stipulated outright: the third he locked up for the present quietly in the secret recesses of his own bosom.

Winifred, for her part, was not wholly averse, either, to the remodelling of Whitestrand. The house, she admitted, was old-fashioned and dowdy. Its antiquity went back only to the 'bad period.' After the æsthetic London drawing-rooms of the Cheyne Row set, she confessed to herself, grudgingly—though not to Hugh—that the blue satin and white-gold paint of the dear old place seemed perhaps just a trifle dingy and antiquated. There were tiny cottages at Hampstead and Kensington that Whitestrand Hall could never reasonably expect to emulate. She didn't object to the alterations, she said, so long as the original Elizabethan front was left scrupulously intact, and no incongruous meddling was allowed with the oaken wainscot and carved ceiling of the Jacobean vestibule. But where, she asked, with sound Suffolk common-sense, was the money for all these improvements to come from? A season of falling rents, and encroaching sea, and shifting sands, and agricultural depression, with Hessian fly threatening the crops, and obscure bacteria fighting among themselves for possession of the cattle, was surely not the best-chosen time in the world for a country gentleman to enlarge and complete and beautify his house in.

'Pooh!' Hugh answered, in one of his heroically sanguine moods, as he sat in the dining-room with his back to the window and the hated poplar, and his face to the ground-plans and estimates upon the table before him. 'I mean to go up to town for the season always, and to keep up my journalistic connection in a general way; and in time, no doubt, I shall begin to get work at the bar also. I shall make friends assiduously with what a playful phrase absurdly describes as "the lower branch of the profession." I shall talk my nicest to every dull solicitor I meet anywhere, and do my politest to the dull solicitor's stupid wife and plain daughters. I'll fetch them ices at other people's At Homes, and shower on them tickets for all the private views we don't care about, and all the first nights at

uninteresting theatres. That's the way to advance in the profession. Sooner or later, I'll get on at the bar. Meanwhile, as the estate's fortunately unencumbered, and there's none of that precious nonsense about entail, or remainders, or settlements, or so forth, we can raise the immediate cash for our present need on short mortgages.'

'I hate the very name of mortgages,' Winifred cried impatiently. 'They suggest brokers' men and bailiffs, and bankruptcy and beggary.'

'And everything else that begins with a B,' Hugh continued, smiling a placid smile to himself, and vaguely reminiscent of *Alice in Wonderland*. 'Why with a B?' Alice said musingly.—'Why not?' said the March Hare.—Alice was silent.—'Now, for my own part, I confess, on the contrary, Winifred, to a certain sentimental liking for the mortgage as such, viewed in the abstract. It's a document intimately connected with the landed interest and the feudal classes; it savours to my mind of broad estates and haughty aristocrats, and lordly rent-rolls and a baronial ancestry. I will admit that I should feel a peculiar pride in my connection with Whitestrand if I felt I had got it really with a mortgage on it. How proud a moment, to be seized of a mortgage! The poor, the abject, the lowly, and the landless don't go in heavily for the luxury of mortgages. They pawn their watch, or raise a precarious shilling or two upon the temporary security of Sunday suits, kitchen clocks, and second-hand flat-irons. But a mortgage is an eminently gentlemanly form of impecuniosity. Like gout and the lord-lieutenancy of your shire, it's incidental to birth and greatness.—Upon my word, I'm not really certain, Winnie, now I come to think upon it, that a gentleman's house is ever quite complete without a History of England, a billiard table, and a mortgage. Unencumbered estates suggest Brummagem: they bespeak the vulgar affluence of the *nouveau riche*, who keeps untold gold lying idle at his bankers on purpose to spite the political economists. But a loan of a few thousands, invested with all the glamour of deposited title-deeds, foreclosing, engrossed parchment, and an extremely beautiful and elaborate specimen of that charming dialect, conveyancers' English, carries with it an air of antique respectability and county importance that I should be loth to forego, even if I happened to have the cash in hand otherwise available, for carrying out the necessary improvements.'

'But how shall we ever pay it back?' Winifred asked, with native feminine caution.

Hugh waved his hands expansively open. When he went in for the sanguine, he did it thoroughly. 'One thing at a time, my child,' he murmured low. 'First borrow; then set your wits to work to look around for a means of repayment.—In the desk at home in London this very moment lies an immortal epic, worth ten thousand pounds if it's worth a penny, and cheap at the price to a discerning purchaser. Ormuz and Ind are perfect East Ends to it. It teems with Golcondas and Big Bonanzas. In time the slow world must surely discover that this England of ours still encloses a great live poet. The blind and battling must open their eyes and look at last placidly about them. They'll then be glad to buy fifty editions of that divine strain, varying

in character from the large paper *édition de luxe* in antique vellum at ten guineas—five hundred numbered copies only printed, and issued to subscribers upon conditions which may be learnt on application at all libraries—to the school selection at popular prices, intended to familiarise the ingenuous youth of this nation with the choicest thoughts of a distinguished and high-minded living author.—Winnie, I'm tired to death of hearing people say when I'm introduced to them: "Oh, Mr Massinger, I've often wanted to ask, are you descended from the poet Massinger?" I mean the time to arrive before long when I can answer them plainly with a bold face: "No, my dear sir, or madam, I am not; but I *am* the poet Massinger, if you care to be told so."—When that time comes, we'll pay off the mortgages and build a castle—in Spain or elsewhere—with the balance of our fortune. Meanwhile, we have always the satisfaction of knowing that nothing on earth could be more correct or squirearchical in its way than a genuine mortgage.'

'I'm not so sure as I once was, Hugh, that you'll ever make much out of your kind of poetry.'

'Of course not, my child; because now I happen to be only your husband. A prophet, we know on the best authority, is not without honour, et cætera, et cætera. But I mean to make my mark yet for all that; ay, and to make money out of it, too, into the bargain.'

So, in the end, Winifred's objections were overruled—since this was not a matter upon which that young lady felt strongly—and the money for 'improving and developing the estate' having been duly raised by the aid, assistance, instrumentality, or mediation of that fine specimen of conveyancers' English aforesaid, to which Hugh had so touchingly and professionally alluded, a fashionable architect was invited down from town at once to inspect the Hall and to draw up plans for its renovation as a residential mansion of the most modern pattern.

The fashionable architect, after his kind, performed his work well—and expensively. He spared himself no pains and Hugh no money on rendering the Hall a perfect example on a small scale of the best Elizabethan domestic architecture. He destroyed ruthlessly and repaired lavishly. He put mullions to the windows and pillars to the porch, and moulded ceilings to the chief reception-rooms, and oaken balustrades to either side of the wide old rambling Tudor staircase. He rebuilt whatever Inigo had defaced, and pulled down whatever of vile and shapeless Georgian contractors had stolidly added. He 'restored' the building to what it had never before been: a fine squat old-fashioned country mansion of the low wind-swept East Anglian type, a House Beautiful everywhere, without and within, and as unlike as possible to the dingy Hall that Hugh Massinger had seen and mentally discountenanced on the occasion of his first visit to Whitestrand. 'You give an architect money enough,' says Colonel Silas Lapham in the greatest romance—bar one—in the English language, 'and he'll build you a fine house every time.' Hugh Massinger gave his architect money enough, or at least credit enough—which comes at first to the same thing—and he got a fine house, as far as the means at his disposal went, on that ugly corner of flat sandy waste at forsaken Whitestrand.

When the building was done and the papering finished, they set about the furnishing proper. And here, Winifred's taste began to clash with Hugh's; for every woman, though she may eschew ground-plans, elevations, and estimates, has at least distinct ideas of her own on the important question of internal decoration. The new Squire was all for oriental hangings, Turkey carpets, Indian durrees, and Persian tiling. But Mrs Massinger would have none of these heathenish gewgaws, she solemnly declared; her tastes by no means took a Saracenic turn. Mr Hatherley and the Cheyne Row men would make fun of her, and call her house Liberty Hall, if she furnished it throughout with such Mussulman absurdities. For her own part, she renounced Liberty and all his works: she eschewed everything east of longitude thirty degrees: inlaid coffee-tables were an abomination in her eyes; pierced Arabic lamps roused no latent enthusiasm: the only real thing in decoration was Morris; and on Morris she pinned her faith unreservedly. She would be utterly utter. She had a Morris carpet and Morris curtains; white ivory paint adorned her lop-sided overmantels, and red De Morgan ware with opalescent hues ranged in long straight rows upon her pigeon-hole cabinets. To Hugh's poetical mind this was all too plaguy modern; out of keeping, he thought, with the wide oaken staircase and the punctilious Elizabethanism of the eminent architect's façade and ceilings. Winifred, however, laughed his marital remonstrances to utter scorn. She hated an upholsterer's house, she said, all furnished alike from end to end with servile adherence to historical correctness. Such puritanical purism was meant for slaves. Why pretend to be living in Elizabethan England or Louis Quinze France, when we're really vegetating, as we all know, in the marshy wilds of nineteenth-century Suffolk? Let your house reflect your own eclecticism—a very good phrase, picked up from a modish handbook of domestic decoration. She liked a little individuality and lawlessness of purpose. 'Your views, you know, Hugh,' she cried with the *ex cathedra* conviction of a woman laying down the law in her own household, 'are just the least little bit in the world pedantic. You and your architect want a stiff museum of Elizabethan art. It may be silly of me, but I prefer myself a house to live in.'

"The drawing-room does look so perfectly lovely," you remember, Hugh quoted quietly from her own old letters. "We've done it up exactly as you recommended, with the sage-green plush for the old mantel-piece, and a red Japanese table in the dark corner; and I really think, now I see the effect, your taste's simply exquisite. But then, you know, what else can you expect from a distinguished poet! You always do everything beautifully!" Can you recollect, Mrs Massinger, down the dim abyss of twelve or eighteen months, who wrote those touching words, and to whom she addressed them?

'Ah, that was all very fine then,' Winifred answered with a pout, arranging Hugh's Satsuma jars with Japanese irregularity on the dining-room overmantel. 'But you see that was before I'd been about much in London, and noticed how other people smarten up their rooms, and formed my own taste in the matter of decoration. I was then in the frankly unsophisticated state. I'd

studied no models. I'd never seen anything beautiful to judge by.'

'You were then Miss Meysey,' her husband answered, with a distantly cold inflection of voice. 'You're now Mrs Hugh de Carteret Massinger. It's that that makes all the difference, you know. The reason there are so many discordant marriages, says Dean Swift, with more truth than politeness, is because young women are so much more occupied in weaving nets than in making cages.'

'I never wove nets for you,' Winifred cried angrily.

'Nor made cages either, it seems,' Hugh answered with provoking calmness, as he sauntered off by himself, cigar in hand, into the new smoking-room.

Their intercourse nowadays generally ended in such little amenities. They were beginning to conjugate with alarming frequency that verb to nag, which often succeeds in becoming at last the dominant part of speech in conjugal conversation.

One portion of the house at least, Hugh succeeded in remodelling entirely to his own taste, and that was the bedroom which had once been Elsie's. By throwing out a large round bay-window, mullioned and decorated out of all recognition, and by papering, painting, and refurbishing throughout with ostentatious novelty of design and detail, he so completely altered the appearance of that hateful room that he could hardly know it again himself for the same original square chamber. Moreover, that he might never personally have to enter it, he turned it into the Married Guest's Bedroom. There was the Prophet's Chamber on the Wall for the bachelor visitors—a pretty little attic under the low eaves, furnished, like the Shunammite's, with 'a bed, and a table, and a stool, and a candlestick'; and there was the Maiden's Bower on the first floor, for the young girls, with its dainty pale-green wardrobe and Morris cabinet; and there was the Blue Room for the prospective heir, whenever that hypothetical young gentleman from parts unknown proceeded to realise himself in actual humanity; so Hugh ventured to erect the remodelled chamber next door to his own into a Married Guest's Room, where he himself need never go to vex his soul with unholy reminiscences. When he could look up at the Hall with a bold face from the grass plot in front, and see no longer that detested square window, with the wistaria festooning itself so luxuriantly round the corners, he felt he might really perhaps after all live at Whitestrand. For the wistaria, too, that grand old climber, with its thick stem, was ruthlessly sacrificed; and in its place on the left of the porch, Hugh planted a fast-growing new-fangled Ampelopsis, warranted quickly to drape and mantle the raw stone surfaces, and still further metamorphose the front of the Hall from what it had once been—when dead Elsie lived there. All was changed, without and within. The Hall was now fit for a gentleman to dwell in.

Only one eyesore still remained to grieve and annoy him. The Whitestrand poplar yet faced and confronted him wherever he looked. It turned him sick. It poisoned Suffolk for him. The poplar must go! He could never endure it. Life would indeed be a living death, in sight

for ever of that detested and grinning memorial. For it grinned at him often from the gnarled and hollow trunk. A human face seemed to laugh out upon him from its shapeless bores—a human face, fiendish in its joy, with a carbuncled nose and grinning mouth. He hated to see it, it grinned so hideously. So he set his wits to work to devise a way for getting rid of the poplar, root and branch, without unnecessarily angering Winifred.

SMITH-OLGY.

WE have all of us, probably, at one time or another in our lives heard some friend speak jocularly of the rarity of the name Smith. Most of us, too, have remarked, upon hearing this observation, that the name certainly was uncommon, but that we had nevertheless heard it before. Although this would-be and time-honoured jest has by frequent repetition come to be what is usually termed 'odious,' but very little research is needed to show that, in the first instance at least, it had a great deal of point. So overwhelmingly numerous, indeed, are the members of the great Smith family, that they are well worthy of being made a special study; and that this study, which may be conveniently termed Smith-ology, is one of no slight interest, the following remarks are intended to show.

Who the original Mr Smith was, it is now impossible to say; but it may safely be presumed of him that he would have been no supporter of the doctrines propounded by Mr Malthus, had that gentleman lived before him. It may also be taken for granted that he derived his now familiar name, etymologically, from his occupation. As an old saw has it:

From whence came Smith, all be he knight or squire,
But from the Smith that forges in the fire?

At the present day we have many smiths of many kinds—goldsmiths, silversmiths, locksmiths, blacksmiths, &c.; and there is no reason to doubt that in early times they were proportionately just as numerous; for we read (2 Kings, xxiv. 16) that the king of Babylon took captive 'all the men of might, even seven thousand, and craftsmen and smiths a thousand.' But however this may have been, there is certainly no scarcity of Smiths in our days. In all English-speaking countries the Smiths outnumber the members of any other family; and they are also very numerous in all European countries. Thus, the German Schmidt is almost as familiar as our Smith; while in other foreign tongues the same well-known name may be detected under many curious disguises. Its various other English forms, as Smithe—which is very uncommon—Smyth, and Smythe, can hardly be spoken of as disguises; for although these spellings of the name nowadays certainly indicate a desire on the part of those so spelling it to show that they come of more ancient and aristocratic or better family than the other Smiths, it is the case that these forms are more ancient than the ordinary modern form. In times when the spelling of personal surnames was made to vary according to the ignorance or caprice of the writer, it was common to spell Smith with a double *i*. This double *ii* was written *y*, as may still be seen in

physicians' prescriptions, and in the name of the Bowyer-Smijths, Baronets, of Hill Hall, Essex, now almost, if not quite, the only family so spelling the name. In the course of time this form, having the dots omitted, became the *y*, as we now see it in Smyth and Smythe.

A few statistical facts relating to Mr Smith's very large family may now be found of interest. Turning to any Peerage of the United Kingdom, we find that not a single peer now bears the name of Smith in any of its various forms, although the father of the present and third Lord Carrington, now governor of New South Wales, assumed the name of Carington, instead of that of Smith, by royal license, in August 1839; and the late Viscount Strangford, who died in 1869, when his titles became extinct, bore the highly distinctive name of Percy Ellen Algernon Frederick William Sidney Smythe. He was Viscount Strangford in the Irish peerage, and Baron Penshurst in the English.

Among the baronets the name is not uncommon, as no fewer than nine bear it in its different forms, though only three in its ordinary, unadorned, plebeian dress. These three are Sir William Cusack Smith, of Newtown, Ireland; Sir Charles Cunliffe Smith, of Suttons, Romford, Essex; and Sir William Smith, late captain of the Worcestershire yeomanry. Three more baronets, however, bear the name Smith in a compound form. These are Sir Lionel E. Smith-Gordon, of St Florence, Pembrokeshire, who assumed the additional surname of Gordon by royal license in 1868; Sir William H. Smith-Marriott, of Down House, Dorset, whose father, the fourth baronet, assumed the additional surname; and Sir C. E. Smith-Dodsworth, of Thornton Watlass, Yorkshire. The three remaining baronets all distinguish themselves by spelling their common name in different ways. They are: Sir J. H. Greville Smyth, of Ashton Court, Somerset, who assumed the name of Smyth, instead of his original name of Upton, in 1852, he being descended from the late Sir John Smyth, whose titles became extinct in 1849; Sir Charles F. Smythe, of Eshe Hall, Durham; and Sir William Bowyer-Smijth, already alluded to, who is descended from the illustrious Sir Thomas Smith, Secretary of State in the reigns of Edward VI. and Elizabeth, and author of *The Commonwealth of England*.

Eight knights also bear the name Smith: they are chiefly colonial knights, and one of them spells it Smyth.

Of the judges on the bench, only a single one is named Smith—namely, the Honourable Sir Archibald L. Smith, judge of the Queen's Bench.

Among the six hundred and seventy members forming the House of Commons at the present time, there are only four Smiths, and one of these—Mr W. Bickford-Smith, the member for the Truro division of Cornwall—bears the name in a compound form. The others are of course: Mr Abel Smith, member for the eastern division of Hertfordshire; Mr Samuel Smith, member for Flintshire, the well-known Liverpool philanthropist; and the Right Honourable W. H. Smith, member for the Strand division of London, and First Lord of the Treasury in the present Government.

On the whole, it cannot be contended that the name of Smith is especially aristocratic, as it is decidedly uncommon among the 'upper ten'; whilst those who do bear the objectionable name exhibit, as a rule, a most marked desire to disguise it by eccentric spelling, or by using it in a compound form. This weakness must, however, be recognised as one not confined to the Smiths alone.

The Medical Register for 1887 enumerates three hundred and four doctors named Smith, nineteen named Smyth, and three named Smythe; or no fewer than three hundred and twenty-six Smiths of all kinds, being about 1·1 per cent. of all the doctors on the list. Some of these, for distinction's sake, have had bestowed upon them some very high-sounding names. Thus, we meet with Aquilla Smith, Campbell Snodgrass Smith, Gordon S. R. V. Smith, Heckstall Smith, Kenneth Rawlings Smith, Opie Smith, Nicholas Scottowd Smith, Protheroe Smith, &c.

Turning next to the last Clergy List, we encounter three hundred and one clerical Smiths, or about 1·2 per cent. of all the names—about twenty-five thousand—on the list. In proportion to their brethren of other names, therefore, the clerical Smiths are almost exactly equal in number to the medical Smiths. Again, too, we come across names evidently intended to stamp their bearers as something superior to the ordinary Smiths, such as Boteler Chernocke Smith, Orlando Spencer Smith, Hely Hutchinson Smith, Augustus Smith, &c.

The army does not seem to be very abundantly officered with Smiths, as only three hundred and twenty Smiths of all kinds appear in the Army List for 1887, these forming no more than about 0·9 per cent. of the total number of names given, including militia, yeomanry, and Volunteer officers.

In the London Directory, which contains one of the most extraordinary lists of names in existence, eighteen hundred and thirty-nine Smiths are enumerated, twelve hundred and sixty-four of them being in the Commercial Directory, and five hundred and seventy-five in the Court. Among them, are 3·2 per cent. of Smyths and Smythes, these being proportionally far more numerous in the Court than in the Commercial Directory. In the list, one comes across some very curious names, perhaps the most amusing being that of Friend Smith—evidently our old friend of that name—who keeps the *Union* public-house in a thoroughfare near Regent Street. In the Court Directory there are enumerated twenty-two Miss Smiths and fifty-two Mrs Smiths; while in the Commercial Directory we meet with Alfred Smith twenty-six times, Charles Smith sixty-one, Edward Smith thirty-eight, Elizabeth Smith ten, Frederick Smith thirty-four, George Smith seventy-eight, Henry Smith eighty-one, James Smith sixty, John Smith ninety-three, Joseph Smith twenty-nine, and William Smith, one hundred and forty-eight times. The number of different trades, too, carried on by some of these gentlemen is very great; thus, Mr George Smith carries on thirty-two; Mr Henry Smith, forty-one; Mr John Smith, forty-nine; and Mr William Smith, fifty-three.

In the Paris Directory, the name Smith occurs

nine times only. In Burke's *General Armory*, another of the most remarkable lists of English surnames in existence, Messrs Smith, Smyth, Smythe & Co., occupy about one per cent. of the space. The Smiths only occupy two pages out of five hundred and eighty-six in Haydn's *Universal Index of Biography* (1870) and only about the one-tenth part of one of the thirty-two volumes of Chalmers's *Biographical Dictionary* (1816). It must be admitted, therefore, that, except for their great numerical strength, the Smiths as a whole have not, so far, greatly distinguished themselves in the world at large. Among the most illustrious members of the great Smith family named in the works above mentioned are the following: Adam Smith, political economist and author of the *Wealth of Nations*; Sydney Smith, divine, critic, and wit, canon of St Paul's, and originator of the *Edinburgh Review*; Sir Thomas Smith, statesman and scholar; and William Smith, 'Father of British geology.' It would be offensive, perhaps, to include with such as these Joseph Smith, founder of Mormonism, as very few Smiths probably would be found to declare that he had conferred any honour upon their well-known name.

In literature alone, however, the Smiths seem to have been tolerably prolific. The titles of their publications fill ten whole volumes of the stupendous catalogue of the British Museum Library, a catalogue which itself extends to over two thousand volumes! The Smith entries, indeed, are so numerous that they have had to be supplied with an 'Index to Smith,' which itself fills one entire volume—an index, that is, to an index! Neither Brown, Jones, nor Robinson is similarly honoured, nor do they altogether occupy above one half so many volumes of the catalogue as does Mr Smith. Among living literary Smiths, we have a brilliant example in Professor Goldwin Smith, the widely-known Professor of Modern History at Oxford. In defunct periodical literature may be noted *Smith's Journal* and *Smith's Luminary*, both edited by Smiths, but both, unfortunately, short-lived. The *Smiths of Northants*—whoever they may be—seem to have been specially studied by a certain Mr F. C. Smith, who has published their genealogy. The *Heraldry of Smith* has been treated at length by a Mr H. S. Grozebrook, while another gentleman has written on the *Heraldry of Smith in Scotland*. 'Smith College' is an educational establishment situated at Northampton, Massachusetts, United States of America. Somewhere in America, too, there is a 'Smith Manufacturing Company.' This Company is not in any way responsible, as might perhaps be supposed, for the present great superabundance of Smiths; it is simply a Company which manufactures agricultural implements, and which—as is common in America—takes its name from its originator, who in this case happened to be a member of that great family which has already originated so many other important undertakings.

Mark Twain, who has evidently observed the great numerical strength of the Smiths, dedicates his *Celebrated Jumping Frog*, as follows: 'To JOHN SMITH, whom I have known in divers and sundry places about the world, and whose many and manifold virtues did always command my esteem, I dedicate this Book. It is said that the man to whom a volume is dedicated always buys a

copy. If this prove true in the present instance, a princely affluence is about to burst upon THE AUTHOR.

In England, probably because names of places had already become fixed before Mr Smith became so ubiquitous, he has given his name to very few localities, though Smithsby and one or two similar names appear in the *National Gazetteer*. In America, however, Mr Smith has indelibly associated himself with innumerable towns and villages. Thus, in De Colange's *National Gazetteer of the United States* we find mentioned ten places simply named Smith, in addition to the following curious medley of names due to the omnipresence of Mr Smith: Smith and Jordan, Smithborough (two), Smithburgh (two), Smith Creek, Smith Centre, Smithdale, Smithfield (seventeen), Smith Grove, Smith Lake, Smithland (five), Smithpoint, Smithport, Smithriver, Smithroad, Smith's (four), Smithsbasin, Smithsborough, Smithsbridge, Smithsburg (two), Smith's Corners, Smith's Creek (three), Smith's Crossing, Smith's Cross Road (three), Smith's Ferry (four), Smith's Flat, Smith's Ford, Smith's Fork, Smith's Gap, Smith's Grove, Smith's Island (two), Smith's Landing (three), Smith's Mill (two), Smith's Mills (seven), Smith's Point, Smith's Rancho, Smith's Ridge, Smith's River (two), Smith's Station (three), Smith's Turn-out, Smith's Valley (two), Smithton (four), Smithtown (two), Smithville (twenty-one), Smithwick, &c. Many of these names speak very clearly the rudeness of the 'Wild West,' of the crudity of the place-nomenclature employed there, and of the bold and enterprising manner in which the Smiths have ever performed the part of pioneers in the wilderness. Fancy-spellings of the name seem to find but little favour in America, as there is only one place spelling its name with a *y*.

Whilst upon this part of the subject, it should be explained that, according to the best authorities, Mr Smith cannot claim the honour of having given his name to Smithfield, that place having had its name corrupted in the course of time from *Smooth-field*, the 'campus planus' of more ancient times.

And now, to crown all: How many Smiths are there in England? It is impossible to answer this question with precision; but there are data from which an approximately correct idea may be obtained. The Registrar-general tells us that in 1856 it was possible to estimate, from certain records in his keeping, that there were then living in England and Wales about 253,600 Smiths, or one in every seventy-three persons composing the entire population. Supposing that this estimate was correct, and that the same proportion has since been maintained, the statement may fairly be made that there are now about 355,814, or over one-third of a million, Smiths in England and Wales. It is not quite easy to realise at once what an enormous number of people these figures represent. A few simple illustrations may serve to make the matter clearer. For instance, there are more Smiths in England and Wales than there are people in Dublin—indeed, excluding London, there are only four towns in the United Kingdom—namely, Birmingham, Glasgow, Liverpool, and Manchester—containing more people than there are Smiths; while twenty-six out of the fifty-two counties of England and Wales, or one half, have fewer people than the immortal house of Smith

has representatives. It is on record, too, that in the seventeen years between and including 1838 and 1854, 286,037 Smiths were registered as having been either born or married or as having died. Although, as every one knows, the Smiths form numerically the strongest tribe in England, there being one Smith to every seventy-three persons comprising the population, still the Joneses run them very close indeed, there being one in every seventy-six persons. Next in order on the list, according to officially compiled statistics, come Messrs Williams, Taylor, Davis, and Brown. Mr Robinson, who is commonly associated with Messrs Brown and Jones, stands eleventh on the list in respect of his relative numerical strength.

It is in the English language alone, however, that the name may be said to have an undistinguished look. The German Schmidt and the Dutch Smid are closely allied to our own form; but in Gaelic it becomes, as all readers of the *Fair Maid of Perth* must remember, Gow. It is in the French and Gipsy tongues, however, that Smith receives its most splendid transformation; for in the former it becomes Lefèvre, and in the latter Petulengro.

MIN:

A RAILROAD STORY OF THE FAR WEST.

CHAPTER III.

MIN ROSSITER had been established at 44-mile just a year, and in some respects she was much such a girl as when she rode up to Macpherson's office in search of the doctor. She was still a thorough girl—a Western girl, full of health and spirits: she still did many things which would hardly have been considered 'correct' by women of the world, even so far west as Chicago: she still indulged in many a scamper over the plains on the bare back of her tough little pony, quite innocent of such superfluities as hat and gloves. Yes, she was still Min.

And yet, on the other hand, she had vastly improved in many ways. Such articles of dress as her wardrobe contained were old and worn, it is true, but they were always scrupulously neat and clean. Be sure there were no artificial aids to graceful dress in Min's meagre outfit; there were many things besides gloves to which the girl's lithe figure and perfectly formed limbs were utterly strange. Restraint of any kind would have been an abhorrence to Min. Yet, as she came more and more under Macpherson's influence, she knew by feminine intuition—though he spoke never a word about such matters—that he was better pleased when she wore shoes and stockings. And then, though she certainly might have been 'plucked' at a Vassar or Girton examination in almost any branch of study, Min was, thanks to Arthur, well informed upon many subjects, and in the science of telegraphy she was really becoming an expert. Besides, although retaining the old animal spirits and keen enjoyment of outdoor life, in many respects she had stepped over the dividing line between girlhood and womanhood. Slowly, but surely, the truth began to dawn upon Arthur that Min was

growing into a woman—a good woman, too, whom he was in danger of placing in an utterly false position.

And Arthur? Well, he was much the same Arthur who alighted from the cars to relieve Ratty Sykes—at least he seemed so. Whether he still cherished a fatherly regard for Min, remains to be seen; indeed, it is doubtful whether he ever stopped to honestly analyse the exact relation in which he stood, morally, socially, and psychologically toward his one friend. Perhaps he did not care to think about it until it should become absolutely necessary.

Have you ever handled a slender piece of cord through which—unknown to you at first—ran a strand of fine wire? Have you ever tried to snap such a piece of cord? If you have, some such remark may have escaped you as, 'I never dreamed of so much strength in a wisp of twine!' Well, it was much the same with Arthur Macpherson and Min: they were drawn together by cords which must be well strained before their strength could be thoroughly proven.

That autumn there was serious trouble on the great Chicago, Rocky Mountain, and Pacific Railroad. There was a strike of locomotive engineers and their firemen. Of course that meant enforced idleness for the vast majority of the other employees; while of those who were retained at their regular duties, there were many who, openly or secretly, evinced sympathy for the strikers. The strikers were at least honest in that they had the courage to back their convictions by their actions: those who openly sympathised with them were also honest to themselves and to the Company. There were others who continued to accept the wages of their employers, who were secretly aiding the discontented men, and among these traitors were several telegraph operators. It is not necessary here to discuss the merits or demerits of this or any strike; it is sufficient for the purposes of this story to know that the strike existed.

Railroad engineers are perhaps the finest class of skilled labourers anywhere to be found, as the nature and responsibility of their duties require a high order of intelligence: they are generally level-headed men; and the striking engineers on the C. R. M. & P. decided to carry their point, if possible, by moral suasion, without recourse to violence or any kind of law-breaking. Most of them respected this resolve of their leaders; but, as there are black-sheep to be found in almost every flock, there were some wild spirits among the engineers who cherished vindictive feelings towards the railroad management, and who chafed under the restraint laid upon them by the law-abiding majority. Macpherson, having no cause for playing false to his trust, remained faithfully at his post, resolved, so long as he filled the agency at 44-mile, to act in the best interests of his employers. No freight-trains were running, though the passenger trains made their usual journeys, as the U. S. government insisted upon the mail contract being carried out. So telegraph operators had very little to do, especially at such unimportant points as 44-mile. But Arthur became aware that a great many cipher messages were being sent over the wire, chiefly from a station west to New Constantinople on

the east. He noticed, too, that these were invariably sent late in the evening, when he was supposed to be 'off duty.' This rather aroused his suspicions, and Mac decided to take off all these cipher messages as they passed over the wire and try to read them. He of course possessed no key to the cipher; but by dint of close attention and a little study, he discovered the secret, and so was enabled to read all the contraband messages.

It was about eleven o'clock on a dark October night when Mac, who was reading, heard his instrument begin to click as a cipher message passed over the wire for New Constantinople. Instantly, Arthur was all attention, and carefully jotted down on paper the apparently senseless medley of letters and figures which followed each other in rapid succession. When it was finished and acknowledged at Constantinople by the sign O. K. (correct), he took from his pocket the key which he had compiled, and deciphered the following: 'Special on the way west from Omaha with officials. They will be at Constantinople about one A.M., and will require a fresh engine. Have Sam Ripley take the run, if possible. He will know what to do.'

Upon reading this very unofficial message, Macpherson knew full well that mischief was in the wind. At first the thought struck him that he might telegraph east and put the occupants of the special train on their guard; but when he recollected that the telegraph circuit which included 44-mile only extended to Constantinople, where all messages were repeated, he knew the attempt would be useless. Constantinople was well known to be a veritable hotbed of the very worst element of the strikers. Only two extra engines were kept at Constantinople, and Sam Ripley was one of the engineers. He was a clever mechanic and a shrewd, wide-awake engineer; but he was perhaps the most unprincipled man in the service. The very fact that he had not 'gone out' with the rest of the engineers, although he was known to be generally dissatisfied, was in itself cause for suspicion.

In a moment Arthur tried to review the whole situation. He knew that the mischief might all take place before the special could reach 44-mile, which was more than an hour's run from Constantinople. Yet, somehow, he thought Ripley would get the train clear of 44-mile—where he knew Arthur remained loyal—before attempting any foul-play. So he resolved to let the train come on, and then signal it to stop—or at least slow up at 44-mile.

Macpherson made his calculations, and figured that the special would be along in about three hours. One hour later he received a message from the Division Train Despatcher to keep the track clear for a special going West. At 1.15 he was notified that the special had left Constantinople. Then he ran over to Min's little cottage and rapped on the door. 'Min, get up quickly and come over to the office!'

Three minutes later the girl stood beside him in the ten-feet square telegraph office, an inquiring look upon her wide-awake face.

'Min,' said Arthur, 'there is some queer business going on. I cannot tell you what it is because I don't know myself. A West-bound

special will be here in a little while, and the engineer is Ripley, of whom you have heard me speak. Well, I have no orders for the special; but I am going to stop her on my own responsibility, and I am going to quietly board the train. You can attend to the station while I am gone, can't you?"

'Well, I should say so!' answered the girl gaily, elated with the idea of being left in charge of what was to her the most important place on earth. But as a second thought flashed through her brain, her face clouded and she asked: 'Will it be safe for you, Arthur?'

'O yes,' he replied cheerily. 'I shall be back in a few hours probably, or, at latest, on the Atlantic Express in about twenty-four hours.—You just attend to the telegraph, Min. Nobody will interfere with you. If any of the trainmen come through and ask questions, you just tell them to mind their own business.'

Arthur all this time had never thought of possible danger to himself, and if he had, he would never have hinted as much to Min. This was the first time those two had parted, even for a few hours, and both felt the occasion keenly; Arthur more than the girl; for, as they sat in the solemn stillness of the dark night awaiting the train, *he* knew that he might never return to 44-mile alive; while *she* had accepted his assurance that it was only for a short time he would be absent. Min was comparatively content. Macpherson was feeling for the first time the strength of the slender cord which bound him to his young companion.

A slight but ever increasing creaking of the rails told them that the special, though still far distant, was approaching. Arthur put on his hat, buttoned up his coat, took a red lantern in his hand, and prepared to step outside the building.

'Good-bye, Min,' he said, grasping her hand in his. 'Keep a good heart, and don't make any mistakes.'

'Good-bye, Arthur,' was the simple rejoinder—but, as Macpherson took a backward step, the girl, without affectation, put one of her plump arms around his neck and drew his face down while she kissed him on the lips. It was the first time she had kissed him, and afterwards he thought a good deal about that kiss.

As Arthur stepped out on to the track, he could see the huge glaring headlight of the locomotive as it thundered along towards him like some demon monster. On it came with terrific noise and speed, causing the track to throb and rattle with the giant vibrations. Up went Arthur's red light, and in a moment a hoarse shriek from the steam-whistle assured him that his signal had been perceived. As the special came up to him at a slow rate of speed, Macpherson noticed that it consisted only of a baggage car and the President's car, drawn by an enormous locomotive known as 'No. 404.' Chiefly, however, he noticed the handsome, even when dirty, face of the traitorous Sam Ripley. As the engineer peered from his perch in the furnace-illuminated cab out into the dark night, he would have made a splendid subject for some such master of weird pictures as Gustave Doré.

'What funny business is this, Mac?' shouted Ripley as he slowly passed Arthur, who was

standing, lantern in hand, outside the dimly lit office. 'I got orders at 'Stan'ople to run to Prairie City.'

'Something wrong, I guess,' said Arthur loudly, so as to be heard above the noise of escaping steam.—'But go ahead, Sam; it's all clear now.'

Ripley drew back and closed the windows of the engine-cab after him; while Arthur, setting his red lantern on the ground, swung himself on to the rear platform of the second car, which was the car occupied by the sleeping officials.

CURIOUS GLEANINGS FROM A BLUE-BOOK.

IN a late discussion in the House of Commons, blue-books were declared to be both voluminous and unreadable—that is to say, not generally interesting. To the bulk of ordinary readers, that is quite an accurate description of these publications. They cannot compete, certainly, in point of popularity with the usual branches of literature, such as fiction, biography, travels, and the like. Still, they have considerable interest of their own kind in various ways; and the particular volume with which it is proposed here to deal contains a good deal of readable and attractive matter. It is the forty-eighth Report of the Deputy Keeper of the Public Records, lately issued, presenting the usual statement of the year's work. The Appendix, which extends to a formidable length, includes several Calendars or lists of state papers; and it is from one of these, a Calendar of Privy Seals, royal proclamations, &c. during four years of the reign of Charles I. (1632-35), that we propose to make some selections.

The most generally interesting of the notices, which are of an infinitely varied description—mechanical, historical, commercial, and social—are those, perhaps, relating to the granting of privileges and patents for new mechanical processes, some of these being curious foreshadowings of modern inventions. Here, on the first page (5th April 1632), is a grant to John Saunders, Nathaniel Waterhouse, and John Ayrs: 'Patent of privilege for their invention of an engine for forcing ships, hoys, &c. against wind and tide.' It would be interesting to know what was the principle of the moving power here. Not steam, it is to be supposed, but rather some sort of mechanical contrivance for moving paddle-wheels. Another privilege, somewhat analogous, is conceded to Richard Norwood in similar terms: 'Patent of privilege for his invention for diving into the sea, or other deep waters, and for raising lost goods,' &c. There is an interesting entry of an agricultural kind which may also be quoted: 'Patent (to William Parham and three others) for the engine invented by them for ploughing land without horses.' Two hundred and fifty years have elapsed since this attempt at improving agricultural operations; but it is only within the last thirty or forty years that the idea of ploughing without horses or cattle has been realised.

Nor is 'high-farming' quite so modern as is generally supposed, as we find noticed in this list of patents 'an invention for fertilising arable

land.' A variety of other schemes of the same nature may be enumerated in a summary way. There are several for draining mines of water, a plan for raising submerged ships, one or two patents for making salt, others for saving fuel, which last read like the advertisements of a newly invented stove. The following has a quaint flavour: 'Patent and privilege (to two Frenchmen) for fourteen years to use a secret for making water-mills upon standing waters, provided it be not inconvenient to the commonwealth, and they keep an English apprentice.' A William Barton has also a privilege for fourteen years for his invention of 'an engine for continuous motion,' a dream of paradoxical physicists in all ages! An invention for making charcoal, or 'charking-coal' as it is termed, also gets a patent; and in another department, a process for making woollen cloth waterproof is mentioned. The dispensation, in the involved style of the period, runs thus: 'Privilege to three persons for fourteen years to put in practice, in England and Ireland, ways by them newly invented for making woollen cloth impenetrable of wet, and serviceable for coaches and wagons.' Some sort of glazing or japanning, probably, such as there still is in the manufacture of wagon-covers.

Monopolies of various kinds are granted in connection with literature, printing, &c. A state-favour of this description is conceded in 1634 to George Latham and two others 'for the sole printing and sale of all set songs, sonnets, &c., to continue twenty-one years.' A preacher and schoolmaster, by name William Brathwaite, gets the sole right to publish music-books. George Sandys, son of an Archbishop of York, and whose name we find among hymn-writers, has granted him a monopoly—copyright, in fact—of the publication and sale of his translation of the Psalter, which is not likely to have proved of great pecuniary benefit. A license to Matthew Cox, for fourteen years, for the sole making of wafers, would be more profitable. A cognate entry appears in favour of 'Edmund Woder, gent.' apparently a teacher of writing: 'Privilege for fourteen years for the sole practice of his new way of teaching to write.' Just below is a proclamation for settling the Letter Office, the designation then of the Post-office.

From a presentation to Stephen Smith we notice the comparative unimportance of the port of Liverpool in 1634. The office to which he was promoted was the Collectorship of Customs at Chester, Beaumaris, and Liverpool! The population of Liverpool was then and for many years afterwards under five thousand! The grandmotherly legislation of these times is amply illustrated by the minute regulations regarding commerce, manufactures, social life, and so on. There are numerous decisions of the Privy Council about the making of girdles, the prices at which butter, cheese, candles, and other commodities were to be sold, what sort of coal was to be used or not used, brewing, and other lofty examples of imperial legislation.

Several prominent names, some of historical and political interest, occur in these old records. There is a presentation to Christopher Wren, father of the great architect, of the Deanery of Windsor. Inigo Jones, for services to art, is exempted from all taxes and tithes, from serving

on juries, and has also a pardon for refusing the honour of knighthood which had been offered him. A pension of two hundred pounds a year is also granted to Sir Anthony Vandyke. Sir H. Vane, father and son, figure here as recipients of the royal bounty, although eclipsed in this respect by William Murray, son of the minister of Dysart, and a youthful companion of King Charles. He is made a Groom of the Bedchamber, gets a pension of five hundred pounds a year, and numerous gifts in the shape of rents of crown lands, produce of taxes, prizes taken in war, and other things. Eventually, he was raised to the peerage by the title of the Earl of Dysart, a dignity still existing. The Dowager-Duchess of Richmond was also specially favoured. She has an annuity of one thousand pounds for ten and a half years, a commutation of her interest in the making and venting (*sic*) of farthing tokens; and in 1635, she and the Duke, her nephew, receive 'a license for twenty-one years to transport woollen cloth undressed.' The two most important names, however, in those notices are those of Laud and Strafford, the two ruling spirits of the day, equally absolute in their political views, and in the end equally unfortunate. Of the Archbishop there is frequent mention. He is promoted to London, thence to Canterbury, and he is the most important member of numerous Commissions both for secular and ecclesiastical purposes. Strafford appears as Viscount Wentworth, Lord Deputy of Ireland, as the title then was.

On the other side of the political stage there are two entries, in February 1633-34, regarding Prynne, the unfortunate author of the *Histrio-Mastix*, a few days after the barbarous punishment inflicted on him by the Star Chamber. In 1632, Lord Baltimore has an important grant of American territory, now forming the State of Maryland; hence the name of the commercial capital, Baltimore; while the province itself owed its name to Queen Henrietta Maria. Another valuable concession, also connected with America, was the monopoly granted to Sir W. Alexander, poet and statesman (afterwards Earl of Stirling), and seven others: 'Demise for thirty-one years of the sole trade into and from the gulf and river of Canada [the St Lawrence now] for beaver-skins, beaver-wools, furs, and skins of wild beasts.' This may be regarded as the precursor of the Hudson's Bay Company, established thirty-seven years afterwards. A very roving commission is also granted to Thomas Young, 'empowering him to explore the undiscovered parts of America.' A singular entry regarding an ancestor of Lord Reay is as follows: 'Revocation of the Commission to Lords Lindsey and Arundel to see the accusation of Donald Mackeay, Lord Reay, against David Ramsey, tried by wager of battle.' This event never took place; both Ramsey and Lord Reay were sent to the Tower.

The successors of George Heriot as the king's jeweller are noticed in these pages. George died in 1624, and was succeeded by his brother James, of whose death there is mention in 1634; and in February 1635, a successor, Jaques Duart, is appointed. In March of the same year, Alexander Heriot is appointed jeweller in ordinary. Pursuing the matter further, there is a record in the first London Directory, dated 1677, of James,

Heriot, a descendant, in the list of 'goldsmiths who keep running cashes ;' that is, bankers.

Among the miscellaneous notices, those relating to eating flesh on fast days are amusing. Sir Henry Clerke has 'a license to eat flesh on fast days, to extend to his wife, their children, and two or three friends at his table, provided he pay thirteen shillings and fourpence yearly at Michaelmas.' Many proclamations occur regarding the time for coming to court to be touched for king's evil. The service of 'the Healing' is to be found in some editions of the Prayer Book about 1710. The form of 'denisation,' or naturalisation, frequently appears. In general, the names are those of foreigners; but Scotsmen were also subject to the same disability, as we find here and there Galloway, Douglas, Kennedy, and other northern names. Licenses to the East India Company to export gold coin are also mentioned, a species of the precious metals not now in circulation in India. Predatory bands of 'broken men' were still giving trouble on the Border, and have a paragraph to themselves. An influential Commission is appointed in 1635 'to arrest and try such persons.' The suppression of profane swearing and cursing is the subject of one or two proclamations, and a Robert Lesley is granted the office of receiver of all forfeitures thus incurred in England and Wales for a period of seven years. Most of these offices, it may be remarked, were granted for 'a consideration,' which in some cases is directly mentioned. That money was frequently scarce in high places there is abundant evidence, and it is likely that most of these privileges would be paid for. Here, in conclusion, is an entry showing that royalty had sometimes to condescend to pawning: 'Commission to Sir W. Boswell, the king's agent at the Hague, and Nathaniel Gerrard, jeweller, to sell certain jewels for twenty-six thousand pounds, and redeem certain others pawned to Francis Vanhoven of Amsterdam.'

Many other interesting items might be quoted; but there is enough, probably, to justify the assertion that blue-books are not always such dry reading as people suppose. The names in the three Calendars included in the volume, dated respectively 1279, 1422-70, 1632-35, numbering several thousands, would themselves form an interesting chapter on English nomenclature; but the subject is too large to be touched on here.

AN INDIAN GHOST.

I WAS very weary, after a long day's work in the scorching, blinding sun among the tea-bushes, and my limbs ached with that dull pain which is the common precursor of malarious fever. I would gladly have slept; but the wind, which had sprung up at sunset, had grown fainter and more faint, and now the air was still and heavy with the damp oppressive heat which foretells a storm. Great banks of black cloud slowly piled themselves in the western sky and blotted out the light of the stars. As I lay before the open door which led into the wide veranda in front of the bungalow, I watched the threatening masses growing higher and higher over the dark belt of forest which formed the boundary of my tea-garden. Outside, I could see wheeling swarms of fireflies lighting up the tea-bushes with fantastic illumina-

tion. Within, all round me was the monotonous murmur of countless mosquitoes. From their venomous sting I was protected by the gauze-net which hung round my bed; but their faint drone dwelt with unwonted persistency upon my overstrung nerves, and effectually dispelled all hope of slumber. Now and again—a hideous relief to the hateful singsong of the mosquitoes—howled a chorus of jackals, now near, now far, but always jarring upon my nerves with a shock of surprise.

I lighted my lamp and tried to read; but my eyes were dazed with the shadeless glare of the day, and my head felt hot and feverish. The words chased each other across the pages, or mixed themselves incoherently with my own wandering thoughts. I felt inclined to wake one of my servants; but the effort of rising was more than I cared to undertake. It seemed easier to lie and watch the storm gathering, to see the distant hills and the brown frothing current of the stream in which the long black masses of the tea-boats were moored, lighted up by lurid flashes of lightning. Save myself, there was not a single soul in the bungalow. It is usual in Indian households for one or two of the servants to lay their simple bedding in one of the doorways or verandas, and there enjoy the sleep which comes so readily to the average oriental by night or day. But my bungalow had the reputation, among the servants and the coolies in the lines, of being haunted. I had not troubled myself to discover the details and the origin of the story. It is enough for an innocent screech-owl to establish herself among the convenient rafters of an Indian roof, to confer a superstitious horror upon the house; and I had not only repressed any faint curiosity I might have felt as to the particular demon or ghost which frightened my servants, but had indulged their wish to keep out of its way. That night, however, my nerves were unstrung; and in spite of repeated efforts to recall my mind to a more rational mood, I felt a sense of solitude and discomfort which hardly amounted to positive terror, but still weighed heavily upon my spirits. I felt vaguely that this unwonted depression of nervous energy, and the dull physical aching which accompanied it, were due to an incipient attack of fever; and, half unconsciously, I got up and helped myself to a dose of quinine from my medicine chest. As I walked across the room I looked automatically in the corner where my spaniel Ponto habitually lay. He was not there; and it was a moment or two before my confused brain remembered that he had been sent away to the native doctor's hut in the lines to be treated for cancer in the ear, a pest to which dogs of his kind are much subject in India. His absence pressed strangely upon my already disordered nerves, and I felt more than ever desirous of some kind of human society.

Meanwhile, the slowly gathering storm seemed to have gathered its strength for the final onset. Far away in the distant woods I heard the sound of rain and wind, growing louder and nearer, and vivid flashes of lightning were followed by deafening rolls of thunder. A cooler air poured through the open door and caused my lamp to flicker and waver. Suddenly the rain and the wind burst upon the bungalow; great drops pattered on the thatched roof, and there was a

sound of rushing sluicing water round the eaves. The open doors began to bang and beat to and fro, and the lamp went out. Outside and inside the bungalow was pitchy darkness, momentarily rent asunder by the piercing whiteness of the flashes of lightning; and in the sudden glare the drops falling from the thatch seemed to stand still. I felt that I ought to get up and close the doors; but in spite of the comparative coolness of the air, which brought with it a revivifying odour of moist earth, I felt loth to stir, and I drew a light quilt over me and languidly watched the lightning. The storm gradually passed its height, and the rushing wind gave place to a steady and strenuous sound of pouring rain. I cursed the foolish fear which prevented my servants from coming to close the jalousies, and listened, in spite of myself, to ascertain if any of them should pluck up courage to come to my aid with a lantern. At last I heard the sound of feet in the veranda at the back and heard the boards creak. I called out, but received no reply. The steps approached my room, and with them, strange to say, I heard the faint clank of a chain. Again I called aloud and again got no reply. The steps came nearer, nearer, and suddenly I felt a heavy weight on my chest, a hot breathing in my face, and the glare of two green eyes close to mine; and then I fainted.

When I came to myself, the lamp was lighted, and my bearer was treading cautiously about the room. Poor Ponto, he said, had been frightened by the storm and had broken loose from his confinement in the doctor's quarters. And then I noticed that Ponto was under my bed, licking my hand as it lay over the edge.

As some excuse for the scare I experienced, I must explain that it was followed by a very severe attack of jungle fever, which compelled me and Ponto to take a change of air and scene. As for my bearer, he believes more firmly than ever that the bungalow is haunted, and has invented a theory that had not Ponto, warned by an instinct keener than human wisdom, come to my aid, his master would have been slain outright by a gigantic and ghastly *bhut*.

THE TELAUTOGRAPH.

America, the land of startling inventions, has just added another to the long list of surprises with which it has favoured the world of science. Professor Elisha Gray, of Highland Park, near Chicago, is reported to have perfected an invention which is destined to displace the telephone for many purposes. The new instrument is called the Telautograph, and by its use a man of business will be enabled to sit down in his office, take up a pencil or pen, write a message, and as his pencil moves, so will a pencil move simultaneously in the office of his correspondent, reproducing in fac-simile the same letters and words. The mode of using the telautograph is as follows: The person wishing to communicate with another pushes a button, which rings an annunciator in the office of the person with whom he desires to hold written communication. Then the first party takes his writing pen or pencil from its holder and writes his message on a roll of paper. As he writes, so writes the pen at the other end of the wire. In writing, the pen or pencil is

attached to two small wires, and these wires regulate the currents which control the pencil at the other end. But these wires give no trouble, and the message may be written just as easily as if they were absent. The writer may use any language; he may write in shorthand, or use a code or cipher; no matter, a fac-simile is reproduced. More than that, if a picture is to be sent by the telautograph, it may be faithfully reproduced. The artist of an illustrated paper may thus transmit a sketch of a railway accident, or any other event, with just as much facility as a reporter telegraphs his description in words. The two pencils move synchronously, and there is no reason why a circuit of five hundred miles cannot be worked as easily as one of ten miles. As observed above, the telautograph will supplant the telephone in many ways, for it will have marked advantages over the latter. It will be noiseless and less affected by induction, and no misunderstanding can arise in its use.

A SONG IN JUNE.

CALM in his chamber the dead man lay,
Shrouded and hid from the face of day.

All fair things in the world outside
Smiled in their fulness of summer pride.

Trees he had loved in his broad demesne,
Stood in their mantle of summer green.

Flowers he had tended, lived and grew,
Welcomed the sunlight and drank the dew.

Children—his own—with prattle and play
Filled the long hours of the sweet June day.

Children too young to grieve or weep,
Knew not the depth of his long quiet sleep.

Day wore on, and the clear cool night
Fell like a veil, with lessening light.

Night passed by, and the pale dawn broke,
Sleeping Earth from her slumber woke.

Through the death-chamber, by sound unstirred,
Trembled the song of a woodland bird—

Song as delightful, and glad, and free,
As a ransomed soul's in heaven might be.

And the mourner—the wife who had lost and loved,
Felt half the weight of her woe removed.

For she said: "Tis an angel sent to tell
That with my Belovèd all is well."

After the night of weeping, she slept.
God save all who such tears have wept!

God send His angel blest to tell
That with their dear ones all is well!

THE FLUSH OF SUMMER.

LAST evening the nightingales were in full song for the first time this season—a soft misty evening, with sweet flower-odours floating in the balmy twilight, and loading the atmosphere with perfume, until it suffused human sensation with dreamy delight in the still warm June gloaming. 'The late sweet air' had been full of the pure liquid song of England's sweetest warbler, and during the short serene night, the sustained length of rapturous melody and clear flexibility of voice, the depth and richness of its flute-like notes, has been heard with little intermission, holding the ear entranced in almost breathless listening, as little by little the shy brown birds have answered each other from the young fir plantations in the coppices, to those hidden in the garden shrubberies. The linked sweetness of plaintive harmony is full of love and joyance as one of Mendelssohn's *Lieder ohne Worte*, or tender and changeful as a Beethoven symphony.

All the short June night I have heard at intervals these full-throated songsters, as also in the earliest dawning, when the stars begin to fade in the purple vault of heaven, which grows paler every minute, and

The Morn,

Waked by the circling hours, with rosy hand
Unbarred the gates of Light.

My blood is on fire with the glory and beauty of the morning, when the flush of summer gladness is over all the earth. I cannot rest in my room; a wild longing comes over me to steal away from the house in the ambient dawning and float down the river—that I can see shimmering not far off—in the swiftly coming light.

For the first time in my life I am staying with a friend in an old country-house, situated on the banks of the Avon, and surely Will Shakespeare never saw a quainter, fairer dwelling-house or a more glorious morning to inspire his genius. The household keeps late hours both night and morning, though buried in the heart of the Mid-

lands; so, scribbling a note to leave on the hall table, and having *carte blanche* to amuse myself as I please for the few days of my holiday from the rush and tear of town-life, I slip down-stairs in the semi-darkness of the closed house, unbar the door, and am standing on the threshold outside. My eyes are dazzled by the sudden flood of sunshine pouring over the dewy garden, that with its first warm rays brings out all the luscious perfume of the wealth of roses, pinks, and faint sweet-scented white hawthorn. As I stand gazing in silent admiration at the fair scene before me, the clock in the hall strikes four. The rays of the sun gleam through the fresh green leafage of the young lindens and kiss them into fluttering gold, and turn the meadow-grass into a sea of waving blossoms. I cross the closely clipped lawn and go down the winding path, through the shrubbery, under huge trees of drooping laburnum and snowy guelder-roses, the pale-green blossoms of the glossy leaved daphnes adding to the wealth of subtle scents that the fresh morning breeze renders so intoxicating. Through a lane with sweet-brier hedges for fifty yards or so, and before me flows the river, on which float a small boat and a couple of canoes in the little sandy pebbly cove, where the bright rippling wavelets lap in soft tidal splashes up to the grassy edge of the lane. Unfastening one of the canoes, I get in and paddle slowly up stream. The birds are revelling in the sunshine, and make a perfect chorus of sweet sounds; numberless larks rise high in the clear blue ether, and sing with wild delirious joy a flood of exhilarating music.

A light breeze springs up, rippling the surface of the green limpid river, and waving the reeds and sedges along the banks, between whose stems trail the myosotis, gazing with forget-me-not eyes up to the bluer sky, that seems clearer and bluer than later in the day. Now I glide along under the ancient pollard willows, with their rough hollow trunks and drooping rain of leaves; among the gnarled and twisted roots the sleek brown water-rats slink suspiciously, or splash into the deep mud-holes. Sometimes I pause beneath the

sweeping boughs of a giant chestnut, still crowned with cones of waxy blooms, or stop to inhale the heavy penetrating scent of the limes, in whose honey-laden flowers hang thousands of honey-laden bees, whose humming makes 'a slumbrous sound that brings the feelings of a dream.'

It is a new and delightful sensation to me to be on the river so early in the day, when the flush and glow and sparkle of the early morning are in their prime, and full of a wealth of hitherto unknown beauties. I can do little but gaze and wonder and enjoy. Surely it was on such a morn that Adam and Eve had the first glimpse of their earthly paradise, and wandered in childlike innocence and faith through the freshly budded woods and flowery hedgerows,

Where the green grew golden above,
And the flag-flowers lighted with laughter,
And the meadow-sweet shook with love.

I hardly realised how long I had been paddling slowly mid-stream, or pausing to take in all the sweet homely sights and sounds of the country, that for the last hour or so had come, mellowed by distance, to my awakened ears: the whistle of the labourer; the sharp bark of a dog and stamping of horses, with the clink of pail or whetting of scythes; the far-off clap of a swing-gate backwards and forwards. Slowly and noiselessly a barge glided past me; a rough-looking man bade me a surly 'Lookout, maister!' as the cord trailed over the canoe and barely escaped capsizeing my frail bark. Sitting on the barge was a gypsy-faced, black-eyed woman, with a ragged hat tilted over her eyes; by her side stood a chattering, laughing, blue-eyed child, over whose lint-white locks four summers had barely passed. She was feeding with ravenous appetite on bits of bread and bacon, cut from a big hunch in the woman's hand, the imperious baby voice calling impatiently for 'More, more!' after every mouthful. A shock-headed boy of ten or twelve lay extended half over the barge, beating the water with a stick.

Whether it was the sight of the little one's keen enjoyment of the homely fare, I know not, but suddenly I became conscious I had been fasting some hours in the morning air, and wondered if I could obtain food anywhere. A few yards farther, turning a bend of the river under a huge cluster of elder bushes, I saw on the bank a dozen or two of cottages, an old church on the hill, and within twenty yards of the bank, a rambling whitewashed inn, called the *Three Pigeons*. It might quite as correctly have been called the Hundred Pigeons, from the great number of those birds that were perched upon the quaint, red-tiled, gable-ended roof, and nestling upon every coign of vantage under the broad eaves, sunning their glossy purple-and-green plumage; the pure white fantails and strutting pouters congregating round the stone trough of the ivy-covered pump, in the sunny strip of courtyard. Here I had a big meal of homely country dainties—ham and fresh eggs, sweet home-made bread and butter, and best of all, a jug of warm new milk. I was very glad of some food, for I had been fasting fourteen hours,

and the fresh breeze on the river for five hours had given me a tremendous appetite.

Afterwards, I sauntered through the hamlet to the queer little one-sided stone church. The door was locked; but I looked in through the narrow grated windows of muddy-green glass. It seemed a bare barn of a place, with high narrow pews and dark and gloomy interior, probably from the sharp contrast outside of the brilliant midsummer sunshine pouring down so joyously upon the moss-grown headstones and grassy mounds of the primitive 'God's-acre,' where a few sheep were contentedly nibbling the short thymy herbage. All round could be seen a fair sweep of green undulating slopes and meadows and leafy woods, the gleaming river winding in and out till it became a tiny silver streak, lost in the misty blue distance.

Down below was the village, a veritable 'Sleepy Hollow,' for any sign of life to be heard or seen. Only behind one cottage a stout red-faced woman was hanging clothes, on lines stretched between rows of beehives; and inside another was heard the drowsy hum of young voices counting to some rhyme, mingled with the jingle of bobbins on the lace pillow. In the distance sounded the dreamy monotonous cry of the cuckoo; from the woods and hills echoed the soft 'wandering voice,' till the wooing summer breeze seemed full of the murmurings.

Gaining the river once more, I paddled slowly along, idly watching the darting swifts and skimming swallows, and drinking in the balmy air, now full of the scent of new-mown hay. About half a mile from the village, a slip of a girl, with a faded blue frock and bright pink sun-bonnet, sat upon the bank amongst the reeds. Her lap was full of cuckoo-flowers, her brown hands as well, the bare brown feet dipping into the water. She might have sat for Mrs Browning's 'Little Ellie,' with her wide blue-eyed smiling face gazing wonderingly at the paddle flashing in the water, and wishing for 'her lover on a red-roan steed.' But no such thought had yet come to the open childish face; the sweet shrill voice was singing 'Shall we gather at the river,' when a woman suddenly called loudly from the next field: 'Sally, Sally, come here!' The singing stopped abruptly; and with a sly grin at me, 'Sally' slipped herself down among the reeds and rushes till she was hidden from view, and with the cuckoo-flowers gathered up in her blue frock, crept along the shelving bank till she was behind a clump of osiers.

On and on in the still hot sunshine of mid-summer. A soft misty haze suffuses the far-reaching hills of which I catch glimpses in the bends of the river, now one side, now the other. Everywhere is the scent of hawthorn and freshly cut grass; past waving fields of young grain, luscious patches of beans in full blossom, glorious sweeps of red clover, coppices of hazel and birch; an old, pleasant-looking farmhouse, nestled under half-a-dozen magnificent beech-trees, on one bank; three or four low crouching thatched cottages on the other; and from up a narrow back-water, come the sound of a rushing mill-wheel and splash of water over the sluice. Somewhere over the fields I can see the brown spire of another church; here a sheltered nook, where

the blue kingfisher yet lingers ; there, a shallow, where cows stand knee-deep in water. Then a dense wood comes in sight ; a little nearer, and I find a small stream under the thick tangle of undergrowth, where I can run the canoe, that rustles the broad leaves of the hartstongue ferns, growing in rich luxuriance, amongst the deep soft moss and water-weeds.

After the clear brilliant sunshine on the river, under these trees it looks pleasantly cool and dim. The grass is soft and green. I fetch my rug from the canoe, spread it at the foot of a giant beech, a monarch of the woods, and stretch myself, with a delicious sense of rest and ease. Overhead, the young leaves are whispering songs of blue skies and golden weather ; the coo of the stockdoves and caw of rooks sound far above me. I close my eyes and dream. Barely sixty hours ago I was in the midst of the tide and rush of business life in London, with the unceasing roar of city traffic in my ears. Now I am out of reach of all sounds save those of Nature—the soft slumberous rustle of

Leaves around, a little stirred,
A sense of music which was rather felt than heard.

With this mingled the flow of water, or the sibilous noise of the yellow willow-wren, that haunts the tops of the beech, singing its queer grasshopper note. Full twenty years have passed since I, a boy of fifteen, last heard that note ; but the rapid association of ideas bridges over time quickly as a flash of electricity from London to Paris, and recalls incidents in those long-forgotten years, with all the clinging memories of youth, when our future life seemed one long vista of fulfilled successes. Ah ! how refreshing is this dreamy rest of mind and body, this ‘silence and stillness, the sweetest of human joys’ under the cool dim shadowy trees. Like as of old to our forefathers was ‘the shadow of a great rock in a weary land,’ so are the ‘green pastures and still waters’ to those amongst us that are compelled to bear the burden and heat of the day in the close warehouses and offices of the city.

Lulled by the cooing doves and tired with the long hours in the open air, I must have insensibly passed from waking dreams to those of sleep. I woke, rested and refreshed, to find it was nearly six o’clock. In a few minutes I was again in the canoe and paddling back at a rapid pace towards Longmead ; but I had come much farther than I imagined ; and it was past eight before I reached the sandy cove whence I started in the dewy morning sunshine. The sweet-brier hedge exhaled its ravishing perfume as I lingered with loitering steps towards the shrubbery path, loth to break the spell of the long peaceful midsummer day. As I stood under the laburnums watching the golden splendour of the setting sun over the distant hills, a liquid note or two greeted my ears, a pause, a *roulade* of joyous music followed ; then the long-sustained, mellow, tender, half-melancholy, flute-like song breaks forth ; clear, keen, and high it mounts like the note of a violin in a master’s hand, as full of bewildering beauty as on the previous night. As one after another of the shy brown warblers takes up the rich cadences, I listen with rapt ears, unconscious of the footsteps approaching, till John Fane lays his hand on my shoulders and says quietly : ‘I began to think

you were lost or drowned. Come in now. You must be famishing.’ With a laugh I turned and followed him. I did not lie and listen to the nightingales that night ; I slept soundly for ten hours without waking.

THIS MORTAL COIL.

CHAPTER XXVIII.—REHEARSAL.

MEANWHILE, when the house was all finished and decorated throughout, Hugh turned his thoughts once more, on fame intent, to his great forthcoming volume of verses. Since he married Winifred, he had published little, eschewing journalism and such small tasks as unworthy the dignity of accomplished squiredom ; but he had been working hard from time to time at polishing and repolishing his *magnum opus*, *A Life’s Philosophy*—a lengthy poem in a metre of his own, more or less novel, and embodying a number of moral reflections, more or less trite, on the youth, adolescence, maturity, and decrepitude of the human subject. It exactly suited Mr Matthew Arnold’s well-known definition, being, in fact, an exhaustive criticism of life, as Hugh Massinger himself had found it. He meant to print it in time for the autumn book-season. It was the great stake of his life, and he was confident of success. He had worked it up with ceaseless toil to what seemed to himself the highest possible pitch of artistic handicraft ; and he rolled his own sonorous rhymes over and over again with infinite satisfaction upon his literary palate, pronouncing them all, on impartial survey, of most excellent flavour. Nothing in life, indeed, can be more deceptive than the poetaster’s confidence in his own productions. He mistakes familiarity for smoothness of ring, and a practised hand for genius and originality. It is his fate always to find his own lines absolutely perfect ; in which cheerful personal creed the rest of the world mostly fails altogether to agree with him.

In such a self-congratulatory and hopeful mood, Hugh sat one morning in the new drawing-room, holding a quire of closely written sermon-paper stitched together in his hand, and gazing affectionately with parental pride at his last-born stanzas. Winifred had only returned yesterday from a shopping expedition up to town, and was idling away a day in rest and repair after her unwonted exertion among the crowded bazaars of the modern Bagdad. So Hugh leaned back in his chair at his ease, and, seized with the sudden thirst for an audience, began to pour forth in her ear in his rotund manner the final finished introductory prelude to his *Life’s Philosophy*. His wife, propped up on the pillows of the sofa and lolling carelessly, listened and smiled as he read and read, with somewhat sceptical though polite indifference.

‘Let me see, where had I got to ?’ Hugh went on once, after one of her frequent and trying critical interruptions. ‘You put me out so, Winnie, with your constant fault-finding ! I can’t recollect how far I’d read to you.’

"Begotten unawares:" now go ahead,' Winifred answered carelessly—as carelessly as though it was some other fellow's poems he had been pouring forth to her.

"Or bastard offspring of unconscious nature, Begotten unawares," Hugh repeated pompously, looking back with a loving eye at his much-admired manuscript. 'Now listen to the next good bit, Winifred; it's really impressive.—

XXXII.

When chaos slowly set to sun or planet,
And molten masses hardened into earth;
When primal force wrought out on sea and granite
The wondrous miracle of living birth;
Did mightier Mind, in clouds of glory hidden,
Breathe power through its limbs to feel and know,
Or sentience spring, spontaneous and unbidden,
With feeble steps and slow?

XXXIII.

Are sense and thought but parasites of being?
Did Nature mould our limbs to act and move,
But some strange chance endow our eyes with seeing,
Our nerves with feeling, and our hearts with love?
Since all alone we stand, alone discerning
Sorrow from joy, self from the things without;
While blind fate tramples on the spirit's yearning,
And floods our souls with doubt.

XXXIV.

This very tree, whose life is our life's sister,
We know not if the ichor in her veins
Thrill with fierce joy when April dews have kissed her,
Or shrink in anguish from October rains;
We search the mighty world above and under,
Yet nowhere find the soul we fain would find;
Speech in the hollow rumbling of the thunder,
Words in the whispering wind.

XXXV.

We yearn for brotherhood with lake and mountain,
Our conscious soul seeks conscious sympathy;
Nymphs in the coppice, Naiads in the fountain,
Gods on the craggy height or roaring sea.
We find but soulless sequences of matter;
Fact linked to fact in adamantine rods;
Eternal bounds of former sense and latter;
Dead laws for living gods.

'There, Winifred, what do you say to that now? Isn't that calculated to take the wind out of some of these pretentious fellows' sails? What do you think of it?'

'Think?' Winifred answered, pursing up her lips into an expression of the utmost professional connoisseurship. 'I think "granite" doesn't rhyme in the English language with "planet;" and I consider "sentience" is a horribly prosaic word of its sort to introduce into serious poetry.—What's that stuff about liquor too? "We know not if the liquor in her something." I don't like "liquor." It's not good: bar-room English, only fit for a public-house production.'

'I didn't say "liquor,"' Hugh cried indignantly. 'I said "ichor," which of course is a very different matter. "We know not if the ichor in her veins." Ichor's the blood of the gods in Homer. That's the worst of reading these things to women: classical allusion's an utter blank to them.—If you've got nothing better than that to object, have the kindness, please, not to interrupt me.'

Winifred closed her lips with a sharp snap;

while Hugh went on, nothing abashed, with the same sonorous metre-marked mouthing:

XXXVI.

'They care not any whit for pain or pleasure
That seem to men the sun and end of all.
Dumb force and barren number are their measure:
What can be, shall be, though the great world fall.
They take no heed of man, or man's deserving,
Reck not what happy lives they make, or mar,
Work out their fatal will, unswerved, unswerving,
And know not that they are.

'Now, what do you say to that, Winifred? Isn't it just hunky?'

'I don't like interrupting,' Winifred snapped out savagely. 'You told me not to interrupt, except for a good and sufficient reason.'

'Well, don't be nasty,' Hugh put in, half smiling. 'This is business, you know—a matter of public appreciation—and I want your criticism: it all means money. Criticism from anybody, no matter whom, is always worth at least something.'

'Oh, thank you, so much. That is polite of you. Then if you want criticism, no matter from whom, I should say I fail to perceive, myself, the precise difference you mean to suggest between the two adjectives "unswerved" and "unswerving." To the untutored intelligence of a mere woman, to whom classical allusion's an utter blank, they seem to say exactly the same thing twice over.'

'No, no,' Hugh answered, getting warm in self-defence. '"Unswerved" is passive; "unswerving" is active, or at least middle: the one means that they swerve themselves; the other, that somebody or something else swerves them.'

'You do violence to the genius of the English language,' Winifred remarked curtly. 'I may not be acquainted with Latin and Greek, but I talk at least my mother-tongue. Are you going to print nothing but this great, long, dreary incomprehensible *Life's Philosophy* in your new volume?'

'I shall make it up mainly with that,' Hugh answered, crest-fallen, at so obvious a failure favourably to impress the domestic critic. 'But I shall also eke out the title-piece with a lot of stray occasional verses—the *Funeral Ode for Gambetta*, for example, and plenty of others that I haven't read you. Some of them seem to me tolerably successful.' He was growing modest before the face of her unflinching criticism.

'Read me *Gambetta*,' Winifred said with quiet imperiousness. 'I'll see if I like that any better than all this foolish maundering Philosophy.'

Hugh turned over his papers for the piece 'by request,' and after some searching among quires and sheets, came at last upon a clean-written copy of his immortal threnody. He began reading out the lugubrious lines in a sufficiently grandiose and sepulchral voice. Winifred listened with careless attention, as to a matter little worthy her sublime consideration. Hugh cleared his throat and rang out magniloquently:

'She sits once more upon her ancient throne,
The fair Republic of our steadfast vows:
A Phrygian bonnet binds her queenly brows;
Athwart her neck her knotted hair is blown.
A hundred cities nestle in her lap,
Girt round their stately locks with mural crowns:
The folds of her imperial robe enwrap
A thousand lesser towns.'

"Mural crowns" is good,' Winifred murmured satirically: 'it reminds one so vividly of the stone statues in the Place de la Concorde.'

Hugh took no notice of her intercalary criticism. He went on with ten or twelve stanzas more of the same bombastic, would-be sublime character, and wound up at last in thunderous tones with a prophetic outburst as to the imagined career of some future Gambetta—himself possibly:

'He still shall guide us toward the distant goal;
Calm with unerring tact our weak alarms;
Train all our youth in skill of manly arms,
And knit our sires in unity of soul:
Till bursting iron bars and gates of brass
Our own Republic stretch her arm again
To raise the weeping daughters of Alsace,
And lead thee home, Lorraine.'

'Well, what do you think of *that*, Winnie?' he asked at last triumphantly, with the air of a man who has trotted out his best war-horse for public inspection and has no fear of the effect he is producing.

'Think?' Winifred answered. 'Why, I think, Hugh, that if Swinburne had never written his Ode to Victor Hugo, *you* would never have written that Funeral March for your precious Gambetta.'

Hugh bit his lip in bitter silence. The criticism was many times worse than harsh: it was true; and he knew it. But a truthful critic is the most galling of all things.

'Well, surely, Winifred,' he cried at last, after a long pause, 'you think those other lines good, don't you?—

And when like some fierce whirlwind through the
land
The wrathful Teuton swept, he only dared
To hope and act when every heart and hand,
But his alone, despaired.'

'My dear Hugh,' Winifred answered candidly, 'don't you see in your own heart that all this sort of thing may be very well in its own way, but it isn't original—it isn't inspiration; it isn't the true sacred fire: it's only an echo. Echoes do admirably for the young beginner; but in a man of your age—for you're getting on now—we expect something native and idiosyncratic.—I think Mr Hatherley called it idiosyncratic.—You know Mr Hatherley said to me once you would never be a poet. You have too good a memory. "Whenever Massinger sits down at his desk to write about anything," he said in his quiet way, "he remembers such a perfect flood of excellent things other people have written about the same subject, that he's absolutely incapable of originality." And the more I see of your poetry, dear, the more do I see that Mr Hatherley was right—right beyond question. You're clever enough, but you know you're not original.'

Hugh answered her never a single word. To such a knock-down blow as that, any answer at all is clearly impossible. He only muttered something very low to himself about casting one's pearls before some creature inaudible.

Presently, Winifred spoke again. 'Let's go out,' she said, rising from the sofa, 'and sit by the sea on the roots of the poplar.'

At the word, Hugh flung down the manuscript in a heap on the ground with a stronger expression than Winifred had ever before heard fall from his lips. 'I hate the poplar!' he said angrily;

'I detest the poplar! I won't have the poplar! Nothing on earth will induce me to sit by the poplar!'

'How cross you are!' Winifred cried with a frown. 'You jump at me as if you'd snap my head off! And all just because I didn't like your verses.—Very well then; I'll go and sit there alone.—I can amuse myself, fortunately, without your help. I've got Mr Hatherley's clever article in this month's *Contemporary*.'

That evening, as they sat together silently in the drawing-room, Winifred engaged in the feminine amusement of casting admiring glances at her own walls, and Hugh poring deep over a serious-looking book, Winifred glanced over at him suddenly with a sigh, and murmured half aloud: 'After all, really I don't think much of it.'

'Much of what?' Hugh asked, still bending over the book he was anxiously consulting.

'Why, of that gourd I brought home from town yesterday. You know Mrs Walpole's got a gourd in her drawing-room; and every time I went into the vicarage I said to myself: "Oh, how lovely it is! How exquisite! How foreign-looking! If only I had a gourd like that, now, I think life would be really endurable. It gives the last touch of art to the picture. Our new drawing-room would look just perfection with such a gourd as hers to finish the wall with." Well, I saw the exact counterpart of that very gourd the day before yesterday at a shop in Bond Street. I bought it, and brought it home with exceeding great joy. I thought I should then be quite happy. I hung it up on the wall to try, this morning. And sitting here all evening, looking at it with my head first on one side and then on the other, I've said to myself a thousand times over: "It doesn't look one bit like Mrs Walpole's. After all, I don't know that I'm so much happier, now I've got it, than I was before I had a gourd of my own at all to look at."'

Hugh groaned. The unconscious allegory was far too obvious in its application not to sink into the very depths of his soul. He turned back to his book, and sighed inwardly to think for what a feeble, unsatisfactory shadow of a gourd he had sacrificed his own life—not to speak of Winifred's and Elsie's.

By-and-by Winifred rose and crossed the room. 'What's that you're studying so intently?' she asked, with a suspicious glance at the book in his fingers.

Hugh hesitated, and seemed half inclined for a moment to shut the book with a bang and hide it away from her. Then he made up his mind with a fresh resolve to brazen it out. 'Gordon's *Electricity and Magnetism*,' he answered quietly, as unabashed as possible, holding the volume half-closed with his forefinger at the page he had just hunted up. 'I'm—I'm interested at present to some extent in the subject of electricity. I'm thinking of getting it up a little.'

Winifred took the book from his hand, wondering, with a masterful air of perfect authority. He yielded like a lamb. On immaterial questions it was his policy not to resist her. She turned to the page where his finger had rested and ran it down lightly with her quick eye. The key-words showed in some degree at what it was driving: 'Franklin's Experiment'—'Means of Collection'

—'Theory of Lightning Rods'—'Ruhmkorff's Coils'—'Drawing down Electric Discharges from the Clouds.'—Why, what was all this? She turned round to him inquiringly. Hugh shuffled in an uneasy way in his chair. The husband who shuffles betrays his cause. 'We must put up conductors, Winnie,' he said hesitatingly, with a hot face, 'to protect those new gables at the east wing.—It's dangerous to leave the house so exposed. I'll order them down from London to-morrow.'

'Conductors! Fiddlesticks!' Winifred answered in a breath, with wifely promptitude. 'Lightning never hurt the house yet, and it's not going to begin hurting it now, just because an Immortal Poet with a fad for electricity has come to live and compose at Whitestrand. If anything, it ought to go the other way. Bards, you know, are exempt from thunderbolts. Didn't you read me the lines yourself, "God's lightnings spared, they said, Alone the holier head, Whose laurels screened it," or something to that effect? You're all right, you see. Poets can never get struck, I fancy.'

'But "Mr Hatherley said to me once you would never be a poet,"' Hugh repeated with a smile, exactly mimicking Winifred's querulous little voice and manner. 'As my own wife doesn't consider me a poet, Winifred, I shall venture to do as I like myself about my private property.'

Winifred took up a bedroom candle and lighted it quietly without a word. Then she went up to muse in her own bedroom over her new gourd and other disillusionments.

As soon as she was gone, Hugh rose from his chair and walked slowly into his own study. Gordon's *Electricity* was still in his hand, and his finger pointed to that incriminating passage. He sat down at the sloping desk and wrote a short note to a well-known firm of scientific instrument makers whose address he had copied a week before from the advertisement sheet of *Nature*.

WHITESTRAND HALL, ALMUNDHAM, SUFFOLK.

GENTLEMEN—Please forward me to the above address, at your earliest convenience, your most powerful form of Ruhmkorff Induction Coil, with secondary wires attached, for which cheque will be sent in full on receipt of invoice or retail price-list.—Faithfully yours, HUGH MASSINGER.

As he rose from the desk, he glanced half involuntarily out of the study window. It pointed south. The moon was shining full on the water. That hateful poplar stared him straight in the face, as tall and gaunt and immovable as ever. On its roots, a woman in a white dress was standing, looking out over the angry sea, as Elsie had stood, for the twinkling of an eye, on that terrible evening when he lost her for ever. One second, the sight sent a shiver through his frame, then he laughed to himself, the next, for his groundless terror. How childish! How infantile! It was the gardener's wife, in her light print frock, looking out to sea for her boy's smack, overdue, no doubt—for Charlie was a fisherman.—But it was intolerable that he, the Squire of Whitestrand, should be subjected to such horrible turns as these.—He shook his fist angrily at the offend-

ing tree. 'You shall pay for it, my friend,' he muttered low but hoarse between his clenched teeth. 'You shan't have many more chances of frightening me!'

A VISIT TO 'LA CONCIERGERIE,' STATE PRISON OF PARIS.

IN the early part of June last year, a friend and myself wandering in that portion of old Paris famous for its historical associations, stayed our steps before the gilded portals of the newly restored Palais de Justice, one of the most imposing monuments in that fairest of cities. It is superfluous to attempt to narrate all the purposes to which that building has been put since the period of its occupation by the kings of France up to the present time. The portion which more particularly demands our attention for the present is the 'Conciergerie,' the gloomy old Paris prison, and one of the most famous in the annals of France. The ancient prison of the royal palace, its name is derived from the *conciierge* (keeper). Occupying the left wing of the Palais de Justice, running parallel with the Seine, it is one of the principal existing monuments of the Great Revolution. A permit bearing the signature of the prefect of police being necessary before admittance could be gained, our first care was to call at the Prefecture, where on presentation of our cards the required authorisation bearing our names was accorded us. Crossing the broad open courtyard of the police barracks, we retraced our steps to the Quai de l'Horloge, which runs parallel to the river Seine. On the north-east corner of the Tour de l'Horloge, near the Pont au Change, is fixed the oldest public clock in France, having been constructed in 1370 by Henry de Vie, a German clockmaker, and restored in 1852. It is flanked by two figures representing Justice and Piety.

A short walk along the bank of the river brought us to a sentry of the Garde Republicaine on duty before a heavily barred gate. The bell was rung; and presenting our authority to a gate-keeper, we were duly admitted within the precincts. We traversed a rectangular courtyard, and on turning to the right, noticed a pointed doorway secured by a heavily barred door, on the top of which, in stone letters, was the word 'Conciergerie.' We then handed our permit to a warder, and were admitted into the ancient guardroom of St Louis, still used as such by the guardians on duty. After scrutinising our ticket, he opened another barred gate; and descending some steps, we found ourselves in the famous state prison where the principal scenes of the revolutionary drama of 1789 to 1795 were enacted. In a large and lofty hall with Gothic pillars and groined ceiling, we awaited the official conductor who was to show us round.

On the right of the entrance two staircases lead to the Council Chamber on the one side, and to the director's apartments on the other. These two rooms facing the quay are respectively situated in two pointed turrets, called Tour de Castille and Tour de César. The rooms in the Tour de César were used as a prison for Prince Pierre Bonaparte in 1870, and in January 1883 for Prince Jerome Napoleon. The third turret is known as Tour d'Argent, formerly used as the king's treasury, and originally the apartments of

Queen Blanche, the mother of St Louis. The fourth, at the extreme end of the building, in olden days used as a torture chamber, is derisively called *La Tour de Bonbec*, because the prisoners' cries were often heard piercing the thick walls with agonising shrieks. Listeners used to exclaim, '*Il a bon bec*;' alluding to the cries of the hapless and suffering victims.

Quitting the entrance hall, a second broad hall dimly lighted, separated by a *grille* from the first, is entered.

It bears the historic name of the *Rue de Paris*, because during the Reign of Terror two hundred and fifty prisoners were huddled together in this passage. We were informed by the warder who showed us through—a man upwards of seventy years of age, and who has held nearly fifty years the post of keeper at the *Conciergerie*—that the late Emperor, when Prince Napoleon, after his unlucky manifesto, used here to take his daily exercise, no doubt pondering on the vicissitudes of his eventful life. To the left, the visitor looks down into the *Salle St Louis*, a large Gothic crypt, with groined ceiling, and supported upon stone pillars in the same style of architecture. At each angle of the hall are four immense open fireplaces, and a staircase, which formerly led to the *Seine*. This hall was formerly used as a refectory for the servants and others of the king's household. It was recently proposed to have cells placed in this hall; but as it was originally ten feet lower than the level of the quay, it was judged unsatisfactory from a sanitary point of view, and was abandoned.

After viewing this ancient hall, we passed into a small corridor, the walls being whitewashed and kept very clean. It is here that the prisoners' bread is stored. The officials say with a charmingly self-satisfied air: 'Here is made the best prison-bread in the world.' According to their opinion, '*Messieurs les prisonniers*' are not badly treated in the *Conciergerie*. At the end of this corridor in which the bread is kept, an old iron gateway, now blocked up, is seen. This, we were told, was the old *Conciergerie* entrance. Through here, *Marie-Antoinette* went to the scaffold on the 16th of October 1793, in the dreaded *tombereau* vehicle, which called there daily for its human freight to feed the hungry guillotine.

To the right of this corridor is a small square room, the furniture composed of a rusty stove and some camp bedsteads. In this dark room was imprisoned the celebrated *Marquis de Lavalette*, condemned to death for joining the Emperor Napoleon on his return from *Elba* in 1815, but who, on the day before that fixed for his execution, in December of that year, escaped in his wife's clothes, leaving her hidden in his prison bed. Three Englishmen who aided him in his escape were subsequently sentenced to three months' imprisonment. *Lavalette* returned to Paris in 1820, and died in retirement ten years later. In an adjoining room, now used as a kitchen for one of the officers of the prison, Marshal *Ney* was confined, when he used to disturb the *Marquis de Lavalette* by playing the flute. On the 7th of December 1815, the gallant marshal was shot in the garden of the *Luxembourg* for joining the Emperor. When an attempt was made to blind-fold him, he tore away the bandage and

indignantly exclaimed: 'Have you forgotten that for twenty-six years I have lived among bullets?' and laying his hand upon his heart, called out with a steady voice: 'Aim true. France for ever! Fire!' In this cell was also detained the famous poet, *André Chénier*.

Outside is a large square courtyard, in the middle of which stands a circular stone: this is the last vestige of the *Montgomery Tower*—finally demolished in 1789—where the unfortunate Count *Montgomery*, who accidentally, but mortally wounded *Henry II. of France*, was imprisoned after the fatal tournament.

In one corner of this courtyard stands a heavy stone trough, pompously called a fountain. In this basin, during the Revolution, the court ladies and aristocratic beauties were in the habit of washing their linen *en famille*. The courtyard at that time was nicknamed by the Republicans the *Boulevard de Gand*, an ironical allusion to the then fashionable promenade.

Many notable persons left the *Conciergerie* during that sanguinary period, among whom were the *Duc d'Orleans*, *Madame Du Barry*, *Madame Roland*, *Danton*, and others, without mentioning *Robespierre*, *Custine*, *St Just*, and others of the *Revolutionary Tribunal*. Opposite *André Chénier's* window, as they still call it at the prison, are the grated bars behind which *Louis Napoleon*, and his faithful friends, *Morny* and *Conneau*, were put under lock and key. This courtyard is deeply interesting when we hear the illustrious names of those who have paced its stone flags unwillingly, and fain would we linger a little longer here; but the most interesting portion of the prison, *Marie-Antoinette's* cell, remains to be visited. Proceeding along another dimly-lighted passage, at the end of which is a large square opening and a dead wall, stand, on the left, two dirty yellow doors. One is condemned; the second closes with a ponderous lock. From his girdle our guide takes the self-same key as that used at the time of the imprisonment of *Marie-Antoinette*, and we are ushered into the last earthly dwelling-place of that unfortunate queen. The doorway is very low, and we are obliged to stoop in passing through. This was so arranged—we were told—in order to force the proud and royal head to bend before her persecutors. Tradition states that as the queen left her cell on her way to the scaffold in her sweeping robes, she failed to stoop low enough, and so struck her forehead against the top of the doorway as she passed out. Be it true or not, it is certainly accepted by the Austrian royal family; for at the time of *Princess Christine's* passage through Paris on her way to *San Sebastian* to meet her royal fiancé, the young *Princess* and her mother the *Archduchess of Austria* went to the cell of their illustrious ancestress and knelt before the marble monument erected by *Louis XVIII.* to the royal lady's memory; and the young *Princess*, ere quitting the cell, stooped and reverently kissed the spot where a few of *Marie-Antoinette's* gray hairs are said to have been found sticking on the blood-stain left by the blow. The cell, after the Restoration in 1816, was transformed into a small chapel. It is paved with dark-red bricks of a corrugated pattern, the same as existed in 1793. The white marble monument before mentioned, on the left of

the entrance, is surmounted by an urn with a Latin inscription, stating that in this cell Marie-Antoinette-Joséphine-Jeanne d'Autriche, wife of Louis XVI., was confined for seventy-six days before her execution. On an altar stand a crucifix and two candlesticks. The crucifix still occupies the position it did in the hapless queen's day, and no doubt many a time was fervently embraced by her in her hour of fearful trial. A lamp is also suspended from the ceiling.

There are in this cell two paintings, one by Drolling, representing the queen partaking her last sacrament; the other representing her removal from the Temple to the Conciergerie. The queen's furniture at that epoch consisted of a wooden table, a straw-chair, and a truckle bedstead placed against one of the walls. The last-named has since been removed.

A second cell, supposed to have been Marie-Antoinette's oratory, contains a portrait of the unfortunate queen. In the recess of the window in this cell, out of reach of the vandals, is an old-fashioned armchair, the favourite seat of the queen at the Tuileries. It was sent to the prison by Louis XVIII., to be kept there as a relic. It is in the Louis XVI. style, covered with silk, but so faded as to be almost colourless. From this cell we enter the chapel, furnished with rows of wooden pews, and a marble altar like a sarcophagus surmounted by brass candelabra. This chapel is interesting from its associations with the massacre of the Girondists on the 2d of September 1792. The small doorway through which the victims walked out, one after the other, and were foully murdered outside, still exists in the chapel. On the walls at either side may still be seen the remains of the autographs, now almost entirely effaced, traced by the hands of the brave and ill-fated victims when in here on the eve of their execution. Mass used to be said here; and at the far end, above the stone archways, may still be seen the places where the female prisoners attended divine worship. A wonderfully realistic painting, by Müller, of this chapel with prisoners huddled together, used to hang in the Museum of the Luxembourg, entitled 'Last Days of the Reign of Terror.'

At the present time, prisoners are now only kept at the Conciergerie who are awaiting trial. The prisoners are on the spot for their lawyers' visit. After trial, if they be found guilty, they are transferred to different penitentiaries, such as La Roquette, Mazas, &c. A few are brought in the morning, and reinstated in their various places of seclusion in the evening, when awaiting their trial. Sometimes they are brought for days in succession, for they never know the exact time they will be tried. They arrive in what the Parisians strangely call the *Panier à Salade*, better known amongst us as the 'Black Maria,' a closed vehicle, with a series of compartments for one person on each side, with room in the middle for a soldier to keep watch.

The Conciergerie contains about sixty-three cells, constructed in 1864. They are built on a concrete foundation, facing the large windows that look out upon the river Seine, and are said to be among the finest in Europe. They are occupied by prisoners awaiting their trial at the courts, which are held in another part of the building. During our visit, the notorious murderer Fran-

zani was confined there. Our guide informed us that during his time he had had many noted and distinguished prisoners under his charge, including, among others, Orsini and, as we have said, the late Emperor Napoleon; whilst his reminiscences were both many and varied.

MIN:

A RAILROAD STORY OF THE FAR WEST.

CHAPTER IV.

WHEN Macpherson entered the great palace car, all was still as death, save for the swaying of the car, as with increasing velocity it was hauled after the huge locomotive. All the curtains of the sleeping berths were closely drawn, and even the darkey porter was snoring away the hours, seated snugly in a reclining chair. Arthur approached the sleeping man of colour, and by means of a powerful shaking managed to awake the woolly-headed fellow, who started up, vaguely imagining that he had at last fallen into the hands of Western train-robbers.

'Now, don't make a fuss, my lad. If you had kept awake and attended to your business, you would have seen that I got aboard at a regular station. I am one of the agents of this Company, and I have business with the Superintendent. Is he aboard?'

'Ye-ye-yes, sah,' tremblingly replied the half-awakened porter.

'Well, you get him up as quickly as you can. Tell him the 44-mile operator is on the train with an important message.'

Two minutes later, Superintendent Ferris, without coat, collar, or shoes, stood beside Macpherson, whom he eyed closely, much as he had done in his Chicago office more than a year before. It was the first time the two men had met since, for the official had never redeemed his promise to visit 44-mile. Beyond this scrutinising glance, there was nothing strange in the greeting of the Superintendent, who was cool and collected, as became a Western railroad magnate.

'You have a message for me?'

'Yes, sir. Not directly either—but read that.' As he spoke, Arthur handed the official his translation of the last cipher message.

'Very good. Make yourself comfortable. We will see what comes of this.—By the way, where are we now?'

'We are, I should judge,' said Arthur, 'about ten miles west of my place, and about twenty-five miles east of Prairie City, the next station.'

The official proceeded to complete his toilet, and then lit a cigar, which he smoked in silence.

Seven or eight minutes passed, when suddenly Macpherson crossed the car to where the Superintendent sat. 'You know of Ripley, sir—the man who is on the engine?'

'I have heard of him.'

'Well, we are slowing. Perhaps you have hardly noticed it yet. There is no station, no

telegraph cabin or any water-tank near here ; neither is there any level crossing or up-grade. I have good reason for suspecting that the mischief will come in right here, though just what shape it will take I cannot even guess. The boys on the road understand you to be a fearless man : if that is so, follow me. Have you got a revolver—and loaded ?

'Yes.'

'That's good ; you may need it.—Are you a dead-shot ?'

'No.'

'Then give me the revolver. For a short time, try to forget that you are managing this road, and obey my orders.'

Macpherson took the official's pistol, and led the way through the train until they stood upon the front platform of the forward coach—the baggage car.

'I suppose,' said Arthur, 'you are willing that we should at all hazards preserve this train from destruction and get her through in safety ?'

'Of course.'

'Then climb on to the locomotive with me and be prepared for anything.'

The train was now running at a rate of not more than fifteen miles an hour, so that the two men managed to raise themselves on to the tender of the locomotive with comparative ease. As they crawled over the stacks of firewood, both master and man took in the situation at a glance. The engineer was at that instant turning on a full head of steam ; the fireman was closing the door of the furnace which he had just filled up with coal. Both were preparing to desert the engine !

As the two men lay stretched on the top of the tender, Macpherson motioned the Superintendent to keep very still. The fireman made a move to get down from the left-hand side of the engine. 'Come !' shouted Arthur ; and quick as a flash rushed for the fireman, helping that individual to the track by a heavy blow. Almost in the same instant he turned to the engineer, who, though not so far advanced in his movements as the fireman, was preparing to descend the steps on the right-hand side of the engine. Placing the revolver close to the renegade engineer's ear, he shouted : 'Get back there and do your work ! Attend to anything beside your business, even for a moment, and I'll fire !—Furthermore, if this train is not at Prairie City in time, I will see that we have a tarring and feathering exhibition in the station yard.—You need not take your hand off the lever, for I have brought you a fireman—the Superintendent. He will be stoker, while I watch you !'

The engineer was completely cowed. The train, with half-a-dozen valuable lives, was saved from a fearful destruction, and the special, drawn by locomotive No. 404, rolled into Prairie City on schedule time.

It is almost needless to remark that Sam Ripley was discharged at Prairie City, where the Superintendent decided to stay until another crew could come and take the engine. It is almost unnecessary to state that Arthur Macpherson, for his prompt action and personal bravery, received the hearty thanks, not only of Superintendent Ferris, but of the five or six directors who were passengers on the special—among them being the pompous

President of the C. R. M. & P. Of course these important personages immediately thought of cancelling their indebtedness to Arthur by bestowing upon him some sort of a reward. Naturally, promotion for the plucky and faithful agent seemed the easiest and most satisfactory *quid pro quo* with which to balance the account. So the President of the Company very graciously informed Arthur that they were on their way West to try and adjust the difficulty with their engineers, but instructions would be given Mr Ferris to stop at 44-mile on his return trip, when the Superintendent would be authorised to make Mr Macpherson an offer of something better in the way of a position on the C. R. M. & P.

It was in October that Arthur Macpherson saved the special from the destruction planned for it by Sam Ripley and his confederates. Now a year had passed away, and Mac was still at 44-mile ; but how changed the place seemed to him ! What an unsatisfactory period of time his second year had been, as compared with the first ! True, his duties were not more arduous, and, true enough, when the directors learned that he preferred 44-mile to promotion, they agreed that his salary must be substantially advanced—and it was. He still had his office and his 'furnished room,' and there at a little distance was the tiny cottage he had built for Min. But Min ?

There was where the difference lay, and what a difference ! No, she was not dead ; sometimes Arthur almost wished the girl *had* died, for then he would have had her still near him. At least he would have had her grave to tend and care for, and he would have had the satisfaction of knowing that if she had not been his, in the fullest sense of the word, she was no other's. As it was, he knew nothing certainly, except that Min was a thousand miles away—a surpassingly beautiful girl in a great city. Yes, he knew one other thing as certainly as he knew of his own existence : he knew that he loved Min Rossiter—not as a father or as a brother or as a friend, but with all the ardent, whole-souled affection that comes to men and women but once in a lifetime. Arthur began to suspect as much the first quiet hour he spent after the incident on the locomotive, when he thought upon the thrill that ran through him as the girl put her arm around his neck and kissed him. A week later, he knew it all ; for, a week later, Min was gone.

As the President promised, the Superintendent had stopped at 44-mile on his way East, to talk with Arthur. Mr Ferris was much impressed with the girl—as, indeed, most men were who met her afterwards—and became especially interested after learning her history. With Arthur the official could do nothing, as Mac was bent upon staying at the quiet station on the plains. But when he offered Min a place in his own important office in Chicago as his private telegraph operator, with a salary far exceeding that paid to Arthur ; and when he supplemented the financial inducement by picturing to the girl in glowing language the exciting social life of the gay and luxurious Western city, with the promise to assist her to the personal acquaintance of many influential ladies in the world of society—Min succumbed. She was only a girl, and, girl-like, she wanted to see the world. So she went.

Do not think, reader, that Min was ungrateful. Many a sharp twinge of regret did she experience on Arthur's account, and more than once she came near telegraphing Mr Ferris that she had changed her mind. But then she could not look at both sides of the question, and, ignorant of Arthur's unselfish affection for her, she thought that it would be positively wrong to refuse so exceptional a chance of making herself independent. She had no relatives, and really had no claim on Arthur; she ought to be at work in the world, with thoughts for the future. So she reasoned, and Arthur could not do otherwise than uphold her reasoning.

Why not? Why could he not have told her of his love and ask her to be his wife? Well, he might have done that; but such is not the manner of men like Arthur Macpherson. To him such a course would have seemed like taking advantage of the girl's isolated position and her ignorance of the world and its ways. No; he would let her go: he would let her mingle with all sorts and conditions of men: he would let her have all the opportunity possible of seeing the various combinations in the kaleidoscope of life: she should be admired by other men, and—if it must come to that—she should be loved by other men. At present, Arthur was far from certain that Min cared for him with a feeling deeper than gratitude; indeed, he was rather doubtful whether the girl knew the real meaning of love. If she did understand it, and if she did experience it—for him—then Mac thought he knew Min well enough to feel quite safe as to the ultimate issue. And if, after all the tinsel and glare of life in Chicago, he should discover that Min's love was for him alone, then he would join his love with hers, and consider the honours and emoluments of the world well lost for the one prize desired by him.

So Arthur helped her to start—helped her in many ways—with his advice and with his purse. For Min's wardrobe was considerably augmented after a day which she spent in the rather heterogeneous stores of New Constantinople, at Arthur's positive command; and if the girl was not ultra-fashionably dressed when she started away on the Atlantic Express, she appeared far from unbecoming in the outfit which Arthur's thoughtfulness had procured for her. It was two o'clock in the morning when Min boarded the train at the lonely little 44-mile depot; and if her eyes were very red from crying when the express stopped at breakfast-time, I think that something very like a tear trickled down Arthur Macpherson's sunburnt face as, for the first time for more than a year, he made coffee for *one*.

The months passed away, and Arthur became more accustomed to his lonely life, though always there remained the aching void, the incessant longing for the girl who was all he cared for in the world. True, he got many letters from Min; long letters, filled with glowing accounts of her successes, socially and in business. He learned by them that Mr Ferris was very kind and attentive, and that everything possible had been done by him to make Min feel comfortable amid her new surroundings. He had found her a home with a widow and her daughter, and many ladies of his acquaintance had called upon her. Altogether, Arthur came to the conclusion that Min

was really having what she called 'a good time.' Once, one of the conductors, who frequently passed through 44-mile, told Arthur that he had recently visited Chicago, where he saw Min and heard a good deal about her. This man told Macpherson rumour had it that the Superintendent was 'sweet' on his telegraph operator, and was going to marry her. This was not good news for Arthur. Such news is not pleasant for any man to hear. Men with love of a most utterly hopeless nature will feel a keen pang when they learn that the object of their love is to marry another. So Arthur suffered acutely when the conductor told him of the rumour that had come to his ears. It seemed more than a rumour when, a few weeks later, Superintendent Ferris himself made his appearance at 44-mile and plied Arthur with a number of questions relating to Min; and, although the Superintendent did not tell Arthur his object in so many words, a man of less perception and with not half so much interest in the matter could have read Robert Ferris's motives.

When the official had gone, Arthur attempted to reason himself into looking at the matter philosophically. 'Whatever is, is best,' he said, and tried to stop there; but he could not. 'It's hard though, very hard. I did all that a man could do for *him*. I gave him more than fortune, or even life itself. I gave him my name and my reputation, with all my chances in life—which were as good as, ay, better than his. Yet he is not satisfied. He has to come to my lonely hiding-place out here in the wilderness and steal away my one treasure. It's hard! And yet—even now I might—No; never!' And again his thoughts would revert to the girl herself, and he would wonder much that she had not taken him into her confidence on so important a matter as her possible marriage. Poor Arthur!

And Min? Amid all her surroundings, her thoughts continually sped westward to the little station on the plains and her old friend Arthur. She was but a girl, and a young girl at that, and naturally enough she thoroughly enjoyed the novelty of city life. Being a healthy girl, with warm youthful blood coursing through her veins, she entered with zest into all the entertainment and amusement which came in her way. She liked to dance, and she liked to attend the theatre; she liked pleasant company, and she liked to be admired; she liked to remember that she was young and pretty, and she liked to know that others cared to think well of her. But these superficial 'likes' did not represent the innermost feelings of Min's soul. It was not in her nature to forget the man who had stood her in such good stead when she had no other friend in the world. Nay, more than that; Min had discovered, as well as Arthur, that when the strain was laid upon the cord which bound them together, there was a hidden strength which it was utterly impossible to snap. The comparisons which the girl made between Macpherson and all the men, great and small, she met in Chicago were invariably in Arthur's favour; and after an entire year of absence, she found that she still cared more for Arthur Macpherson than for any man she had yet seen. In the summer-time she had tried to arrange for leave of absence, so that she might visit 44-mile; but Mr Ferris had persuaded

her to put off her vacation, on the score of pressing business; so October had come, and she was still at her daily duty in the Superintendent's office.

THE ANIMAL ALKALOIDS.

THE alkaloids are substances which occupy a very important place in the chemistry of life. When absorbed into the animal system, they act most powerfully upon it, some of them being among the direst poisons known to us, while others are invaluable medicines. In order to give the reader a general idea of their nature, it is only necessary to refer to a few typical examples of the class. Take, for instance, nicotine, one of the most poisonous of the alkaloids: this substance is the active principle of the tobacco plant, and is familiar to every smoker, if not by name, at least physiologically; for it is the cause not only of the soothing effects of smoking on the system, but also of the sickness which supervenes upon over-indulgence in the pipe. Strychnine and curarine are also good examples of the more poisonous of the alkaloids. The former is principally derived from the seeds of a plant called *Strychnos Ignatius*, or St Ignatius' bean; while the latter is the poison which gives their deadly character to the arrows used by the natives of certain tropical countries. On the other hand, however, there are included among this class of substances some of the most valuable medicines we possess in these times, such as quinine, which is extracted from the bark of certain species of trees called the Cinchonas; and morphine, one of the alkaloids of opium.

It will be observed that all the substances instanced above are of vegetal origin. Indeed, until very recently, it was thought that plants were the sole agents in the manufacture of alkaloids. Substances of a character very similar were, it is true, frequently detected in animal matter; but their presence there was in the eyes of most people satisfactorily explained by the supposition that they got into the system from without, through the consumption of vegetable matter, or otherwise. Strong arguments in favour of a different explanation might easily have been obtained; for cases of poisoning from animal food in which the symptoms were exceedingly like those which customarily followed overdoses of the known alkaloids, were of by no means rare occurrence. But no regular experiments were undertaken to find out the true cause of the phenomena observed in such cases; and until very recently it does not seem to have been suspected that alkaloids might be elaborated in the tissues of the animal body as well as in those of plants.

The first person who boldly hazarded the hypothesis that substances belonging to the same chemical genus as the vegeto-alkaloids could be elaborated in animal matter was Armand Gautier, a Frenchman. This scientist—who has earned for himself a world-wide reputation for his researches on this subject—about the year 1870 made some interesting observations, which led him to suspect that alkaloids were invariably elaborated during the course of putrefaction of albuminoid matter. Now, by far the greater part of the solid matter of which the animal body is made up consists of

albuminous substances; so that it did not require much straining of argument to show that it was extremely probable that alkaloids would also be formed in decaying animal matter. This probability seems to have at once attracted Gautier's attention; for he soon carried on a series of experiments on fibrin of the blood—that is to say, the albuminous substance which separates from the blood after it has left the body in consequence of the putrefaction, which in such circumstances it quickly undergoes; and from this fibrin, about 1872, he succeeded in obtaining various complex alkaloidal extractives. Thus was his grand hypothesis proved by facts; and the new substances which he discovered were called *ptomaines*, a name clearly indicative of their origin, for it is derived from the Greek word signifying a corpse.

About this same period, Professor Selmi, the famous Italian toxicologist, was engaged in independent researches, which led to a result exactly similar to that obtained by Gautier. This is shown by the communication which Selmi made to the Academy of Science of Bologna early in 1872, the main conclusion of which was, that in the bodies of persons who had died from natural causes were to be found substances which when tested chemically gave evidence of being closely allied to the alkaloids extractable from plants. When it became known that both Gautier and Selmi had arrived at precisely similar results by totally different methods—for the one approached the subject chemically, whereas the other came to his conclusions in consequence of observations made for legal purposes on bodies suspected to have been poisoned—the greatest interest was excited in the scientific world; and this interest was much increased when, shortly after, it was seen that these discoveries would play a most important part in criminal investigations. Selmi himself was engaged in one of the first cases where the question came up. The prosecution had endeavoured to make out that the cause of death was strychnia, one of the vegetable alkaloids; but Selmi, who was called on behalf of the suspected persons, pointed out conclusively that there were certain important differences between strychnia and the poison under examination, and gave his opinion that the compound found was a *ptomaine*. It can easily be seen that if the two kinds of alkaloids are so similar in constitution, it must be very difficult to ascertain which species is actually present in any case, and that much might hang upon the degree of care with which the tests were applied. Many attempts, consequently, were made to discover means whereby the animal and vegetable alkaloids might be distinguished from one another. At one time, it was thought that the requisite tests had been discovered; but the most recent researches seem to show that the chemical constitution of both classes is very similar, and that some at least of the *ptomaines* are identical with the vegetal alkaloids. For example, muscarine, an alkaloid formerly thought to be only derivable from certain poisonous mushrooms, has been discovered by Brieger to be a product of the decomposition of fish, and has even been artificially prepared from other chemical substances.

The origin of these *ptomaines* seems now to be clearly explained. That they arise from

albuminoid material in a state of putrefaction is undoubted, seeing that they have been artificially produced from it. One of Gautier's great scientific triumphs was the separation of various *ptomaines* from pure albumen, which he had allowed to undergo putrefaction free from atmospheric contact, so that there could be no suspicion of their coming from without. But that it would be wrong to assert that putrefaction was the sole means whereby the animal alkaloids were created, was soon to be made evident. With this new departure the name of Gautier is again associated; and it is due to the experiments which this veteran observer undertook between the years 1882 and 1886 that we are now in a position to affirm that it is not only in dead animal matter that cadaveric alkaloids are developed, but that they are also regularly elaborated in healthy tissues in which there is no trace of putrefaction, the vital processes being of themselves quite sufficient to cause their formation.

Suspecting that the poisonous nature of the bites of snakes and other animals was due to alkaloids, Gautier made various experiments in order to come to some conclusion on the subject. One of the most important of these consisted in the extraction from the fangs of the cobra di capello of various substances, which, when injected into mice and birds, even in very minute doses, caused death, preceded by symptoms very similar to those resulting from bites by that species of snake. Finding his suspicions so far correct, he next turned his attention to the human body, and in the course of various experiments on healthy muscular tissue he succeeded in obtaining five new alkaloids. To these newly discovered *vital* alkaloids, as we might term them, he gave the name of *leucomaines*, a word formed from the Greek for albumen, their connection with this latter substance being now firmly established. It only remains in this connection to add, that the varieties of both *ptomaines* and *leucomaines* which have been already discovered are many; but there is here a wide field for further research, not only with a view to finding new alkaloids, but to classifying and fixing upon the chemical constituents of those already detected.

To the importance of these recent discoveries in a legal sense, reference has already been made. From a medical point of view, however, they are likely to be more important still. It is not difficult to understand that there is here a subject the branches of which may be made, without the exercise of much imagination, to extend to almost every corner of pathology. We know as a matter of fact that the other natural waste products of the body, such as urea, carbonic acid, &c., when accumulated in excess in the system cause marked types of disease. Now, if that is so with respect to these substances, surely products of, in general, so poisonous and intricate a character as the *ptomaines* and *leucomaines* must also exercise a most appreciable effect on the system; and if not regularly and constantly eliminated, must undoubtedly cause ill-health. It is a familiar fact that persons constantly fall into states of ill-health which are extremely difficult to cure, and the real cause of which doctors cannot clearly explain. When, however, the symptoms accompanying many of these cases are considered, there is to be seen a wonderful likeness to those

following upon alkaloidal poisoning. The subject is still new, and it would be hazardous to prophesy too much at present with respect to the next advance; but of this we may be certain, that when the influence which these substances exert on the system becomes better known, a complete reform in the medical treatment of many diseases may be anticipated.

THE STORY OF A CRYPTOGRAM.

MR and MRS RONAYNE were generally considered by their friends and acquaintances to be an exceptionally happy and fortunate couple. They had a pretty house at Chiswick, got up in the latest æsthetic-fashionable style. Mrs Ronayne drove out daily either in her neat victoria or neater brougham, drawn by the most spanking pair of chestnuts that ever came out of Tattersall's. Mr Ronayne was known to be 'something in the City,' though what the 'something' was no one knew precisely; but the resulting income must be, every one argued, considerable. No small economies were apparent in their ménage, even to the eyes of the most critical and prying of spinster ladies. Mrs Ronayne had her gowns made at the best of West End 'houses,' and her bonnets and other accessories of attire were quite beyond reproach. As for Ronayne himself, Poole and Smalpage tailored for him, Hoby shod him, and Lincoln and Bennett covered his slightly bald cranium with the most immaculate and glossy of silk hats.

The little dinners given by this fortunate pair were quite epicurean in their way. Though limited as to the number of guests—for it was seldom that more than ten or twelve sat down to the Ronaynes' exquisitely decked table—the hostess was noted for her skill in getting pleasant people together, and therefore her invitations were rarely, if ever, declined, and her guests were never bored. All the married folks of their acquaintance quoted them to each other as a realised ideal of matrimonial felicity.

'Oh Arthur, if you treated me with half the deference and affection with which Mr Ronayne treats his wife,' said Mrs Fitzsharp to her mild-faced lord and master, 'what a happy woman I should be!'

'My dear Mathilda, can't you get a gown to fit you as Mrs Ronayne's fit her? But I suppose it's not the fault of your gowns, after all; it's the dowdy woman inside them,' snarled Mr Brown to his patient spouse, whose only answer was a weary sigh. 'Ronayne is a lucky fellow.'

And so the Fitzsharps and the Browns thought themselves very much to be pitied, while their more fortunate neighbours were to be envied, admired—and toadied.

Everybody was civil, nay, more than civil, to the Ronaynes. Mrs Ronayne's gowns and bonnets were copied by all the maids and matrons in Linden Park; her drawing-room was always full to overflowing on her 'At Home' days, and compliments and pretty speeches floated like incense on the air whenever she put her daintily-shod foot inside her neighbours' doors.

The fortunate Mrs Ronayne lacked nothing; her two children were as pretty and picturesque

as any to be seen portrayed in all the glory of golden hair, plush, and well-turned legs on the walls of Burlington House. Just as a rose looks best with an unfolded bud or two near it, so a pretty woman never looks more charming than when a flower-faced child or two hangs about her. Mrs Ronayne knew this, and 'darling Evie' and 'darling Robbie' were generally to be seen in the drawing-room on her Thursday afternoons, or in the carriage when she drove in the Park. Was there any locked cupboard holding its grinning, bony inmate in that gorgeously furnished suburban villa? Was there one little rift in the lute that made music for the Ronaynes? one crumpled leaf in their couch of roses? one black coarse thread in the cloth-of-gold web of their lives? Let us peep, like Asmodeus, under the Ronaynes' roof and see.

The breakfast hour at Honeywood Villa was nine o'clock, rather an early hour for Londoners, but Mr Ronayne liked to get down to his office by half-past ten, and Mrs Ronayne liked to preside over her husband's matutinal repast, pouring out his coffee with her own fair hands, and casting a solicitous, not to say curious, glance at him as he looked over his correspondence. Indeed, so anxious was she that her lord should lack none of the *petits soins* which were his due, that she always entered the breakfast-room at least a quarter of an hour before him, and cast a housewifely regard over the table, to see that everything was arranged in accordance with his somewhat fastidious taste. At the same time, and for her own satisfaction, she was in the habit of scrutinising pretty closely the covers of all Mr Ronayne's letters.

One bright spring morning Mrs Ronayne emerged fresh and fair as Aurora's self from her chamber, and descending the stairs rather more quickly than usual, entered the cosy little breakfast-room, and went straight to the table where Mr Ronayne's extensive correspondence was spread out imposingly. Running the array of letters over rapidly, she finally singled one out. 'At last!' she said, her colour deepening and her fine eyes growing bigger and brighter as she fixed them indignantly on the address of the letter. 'Post-mark, London, W., and the same handwriting. I should know those *ps* and *ys* anywhere. I will find out who is the writer!' And she slipped the letter in question into the pocket of her artistic morning-gown; and then, as she caught the sound of her husband's footsteps crossing the hall, she turned nonchalantly towards the window and bent over a *jardinière* of white and pink primulas that were putting forth their delicate blossoms to enjoy the morning sunshine.

Mr Ronayne sauntered into the room and went at once to look at his letters. A slight shade of disappointment crossed his face as he shuffled them about like a pack of cards, and he uttered an impatient exclamation.

'What is the matter, dear?' said his wife sweetly. 'Has anything gone wrong?'

'A letter which I expected hasn't come, that's all,' replied Mr Ronayne in a tone of vexation.

'Perhaps it will come by the next post. Was it a very important letter—a business letter?' inquired Mrs Ronayne, looking her husband full in the face.

'Well, yes—it would be rather an important letter—at least it might be.'

'I wonder how much of that is true?' thought his wife. Aloud she said: 'I am so sorry, Dolph.—But eat your breakfast; here are some of the *rognons sautés* you like so much.'

But that morning Mr Ronayne had no appetite; he trifled for a few minutes with his knife and fork, then gulped down his coffee, opened and read some of his letters, none of which seemed to give him any satisfaction, glanced hastily at the *Times*, and finally went off to the City without bestowing upon his wife a single caress, or uttering one of those endearing epithets the constant and public use of which had won for the Ronaynes the reputation of being 'such a happy pair.'

When her Adolphus had taken his departure, Mrs Ronayne ran up to her boudoir, locked the door, and took the purloined letter out of her pocket. 'It's a woman's handwriting—I know it is,' she said to herself as she held it between her trembling fingers. 'Now, I should like to know what business my husband has to receive letters from any woman but his wife.' She turned the offending missive over and looked at the back. It was not sealed, only secured in the ordinary manner. Nothing could be easier than to open it in such a way that none could suspect that it had been tampered with. Running down-stairs, she re-entered the breakfast-room and held the letter to the steam of the kettle, which still stood on the brass trivet beside the fire. In five minutes the envelope had been forced to yield its secret, and Mrs Ronayne was free to indulge her curiosity. With a quickly beating heart she unfolded the single sheet of note-paper the envelope contained, ran her eyes over it, then read word by word what follows:

'3 cannot you realise 10 road run ground mile quarter scarlet runner police and shares 5 in the ambush fine †††† 7 condition so will come enforced sound mine 13 break from my heart to years ago thoroughly prepared so doubtless unavailing fall 20 makes me indeed scattered exception to multitudes little solitude puffs to have spent seven in all ivory remember please impending.'

That was all. There was neither date nor signature to the letter. Mrs Ronayne read it over at least a dozen times, and her delicately pencilled brows drew together in a puzzled frown. What on earth did it all mean? Was the letter a foolish hoax? Was it written by some inmate of Bedlam or Colney Hatch? Or, stay.—Yes; this surely explained the mystery. The letter was in cipher, a cryptogram of the Donnelly-Bacon-Shakespeare order.

'I'll find it out!' panted Mrs Ronayne fiercely.—'I'll find it out—and then tax Adolphus with—with'

As she had not yet settled in her own mind the precise nature of the crime of which her Adolphus had been guilty, Mrs Ronayne could not complete her sentence. All sorts of conjectures were floating in her excited brain. Perhaps it was on this account that although she spent the whole morning in puzzling over the purloined letter, the only thing she got out of it was a racking headache, which not even her favourite remedy, sal-volatile, could cure.

When Mr Ronayne came back from the City about five o'clock, he found his wife reclining gracefully on the sofa in her boudoir, looking pale and heavy-eyed.

'What's the matter, Julia?' he asked kindly. 'You seem seedy.'

'I've a horrid headache,' she answered crossly. '—You don't look particularly bright either,' she added, glancing at Mr Ronayne's puckered forehead and haggard eyes.

'Oh, I've been rather bothered to-day—about business. Nothing of much consequence.'

'Oh—is that all?' answered Mrs Ronayne with one of her quick suspicious glances. She had passed the afternoon shut up there in her room alone, and had worked herself into a perfect fever of doubt and surmise, and finally of jealousy, for jealousy was charming Mrs Ronayne's besetting weakness. It is no doubt very flattering to a man's vanity that his wife should think so highly of his personal attractions that she is in constant dread lest some other woman should fall a victim to them. But, on the other hand, it is a dreadful nuisance when one can't address half-a-dozen words to a pretty girl, or remark that Mrs So-and-So is a very agreeable woman, without enduring a subsequent *peine forte et dure* of reproaches and sneers—and tears.

Mrs Ronayne pored perseveringly over that, to her, nonsensical and unintelligible letter, and at length arrived at the conclusion that it was a cryptogramic love-letter. The handwriting was undoubtedly feminine, and why, argued Mrs Ronayne, should a woman write a letter in cipher to her husband unless she desired to hide something disgraceful.

Mrs Ronayne made up her mind to solve that wicked cryptogram or perish in the attempt. She resolved also to watch her husband carefully during the next few days. Now, Julia Ronayne, though quite clever enough to hold her own in the conventional small-talk conversation usual in her set, had never guessed a conundrum or solved an acrostic in her life. To puzzle out a cryptogram of the simplest nature was quite beyond her power. Baffled and angry, she was at last compelled to own herself nonplussed by the ingenuity of the woman who had written that horrid letter. She, however, resolved to carry out the other part of her plan of campaign—namely, to watch her husband.

Certainly, Adolphus was greatly changed since the eventful morning when she had possessed herself of that queer letter. Each day saw him looking more anxious and careworn and *distrait*.

'He must be very fond of that—that creature,' thought Mrs Ronayne angrily. And she hardened her heart against her husband. She felt that things were coming to a crisis of some sort. Adolphus was evidently depressed and wretched. He ate little and slept less; even the children's chatter failed to rouse him from his fits of gloom. At last the crash came. One evening he returned earlier than usual from the City and went straight up to his wife's boudoir. Mrs Ronayne saw at once that some catastrophe had befallen. Disaster was written on her husband's white, drawn face.

'Julia,' he said huskily—'Julia, my dear'—he took her hand and gazed wistfully into her face—'do you care very much for—for all this?' He

just indicated the luxurious furnishing of the room with a gesture of his left hand.

'What do you mean, Dolph?' asked Julia, startled out of her usual lazy indifference.

'I mean, dear, would it distress you very much to leave Honeywood Villa—and give up'—

'O Dolph, something has happened!' interrupted his wife with a scared look. 'Something has gone wrong in the City.'

Mr Ronayne smiled a wan tired smile. 'Yes, Julia,' he said quietly, 'something has gone wrong—very wrong. I am ruined for'—

'Ruined!' almost shrieked Mrs Ronayne. 'O Dolph, you have been speculating! Haven't I warned you a hundred times against that horrid Stock Exchange? Haven't I often begged you to devote all your energies to the business?'

'Don't cry "I told you so" at me now, Julia,' said Mr Ronayne wearily. 'It is so easy to be wise after the event. This speculation would have made a millionaire of me had it not been for a most unlucky *contretemps*.'

'Of course! That is always the case,' wailed his wife, hiding her face in her pocket-handkerchief and dissolving into tears.

'Come, come; don't cry, my dear,' said Mr Ronayne, who hated to see his wife cry, which was perhaps the reason why she did it so often. 'Things mayn't turn out so badly after all.—You didn't let me finish my sentence just now. I was going to say that I am ruined for the time being. But with a year or two of retrenchment and hard work, I shall pull through, I daresay. What troubles me most is that I must deprive you of so much that I know you care for—your pretty house, your carriage—and unlimited credit at Madame Eulalie's,' he added with a smile.

'How did it happen? Tell me all about it,' said Mrs Ronayne, drying her eyes. Curiosity put grief to flight. She looked up at him with the tears hanging on her lashes and her rosy lips parted eagerly. She had never looked prettier. 'Was it this tiresome business that has made you look so anxious lately?' she added quickly.

'Yes; you see, all this trouble might have been averted had it not been that an important letter miscarried.'

Mrs Ronayne's heart stood still for an instant and then beat furiously. 'An important letter—miscarried,' she repeated in a dazed tone.

'Yes; it was like this. You remember the Thurstons? Well, Thurston and I invested largely in Fourcross Mine shares last year. It's a long story, and I know you don't like business details, so I'll cut it as short as I can. The Fourcross Mine is in South America, and Thurston went over a couple of months ago to see whether the thing was *bonâ fide* or not—whether the shares were worth sticking to, or only good for speculation.—You know the sort of woman Mrs Thurston is?'

'O yes; a dreadful dowdy, and wears spectacles,' interpolated Julia contemptuously.

'A shrewd woman of business though—Thurston's right hand. It was arranged that Mrs Thurston should communicate to me the result of her husband's investigations, which he sent to her by cable in cipher. I daresay you can guess why I did not wish him to communicate with me direct: it was imperative that my connection with him should be kept secret. Unluckily, a

few weeks ago scarlet fever broke out among the Thurston children, and I would not go to the house for fear of bringing the infection here; therefore, Mrs Thurston agreed to write to me in a cipher of a very simple kind, but which would not be intelligible to every one in case any of the letters were tampered with'—

'O Dolph, will you ever forgive me?' burst out Mrs Ronayne suddenly, throwing herself on her husband's breast. 'It was I who stole the letter—it is I who have ruined you!'

'You!' cried Mr Ronayne incredulously.

Julia drew back with a pale frightened face; she dared not meet her husband's eyes. Then she rose mechanically, unlocked her *escritoire*, and took from it the letter, which she tremblingly put into his hand.

'There it is, Dolph,' she said in a low voice.

He took the letter, opened and read it in silence. 'How did you get it?' he said at last, fixing his eyes sternly on his wife's tear-stained face. 'Julia, I can scarcely believe that even you could be such a fool as to have intercepted this letter.'

'I did. But, O Dolph! it was in a woman's handwriting—and I thought—I thought'—

'It's that idiotic jealousy of yours, I suppose!' he interrupted. 'Look here! Will this convince you that Mrs Thurston hasn't written me a love-letter?' he added with grim irony. Then he held the letter towards her, and with a shaking forefinger, indicated first the numerals and then the corresponding words of the cryptogram. 'It's a very simple cipher. *Realise shares Fourcross Mine. Fall impending.* If I had received this letter a week ago, I should have sold the shares at a high figure, and realised a fortune. As it is they are little better than waste paper; if you look at this morning's Money Market you will see why. The Thurstons are all right; for I happened to hear to-day that Mrs Thurston—acting on the private information she had received—instructed her broker to sell a week ago—at the time when she wrote me this letter. But for your folly—or my anxiety about the children, if you like to put it that way—I should have been able to retire from business altogether. As it is, we must let this house for a few years, and live in lodgings as cheaply as we can.—It will be a hard trial for you, my poor girl; but I hope it will have cured you once and for always of your foolish and groundless jealousy.—And,' he added with a smile, 'perhaps in future you won't think it necessary to tamper with my letters.'

TEARS IN LITERATURE.

TEARS have played no unimportant part in literature, especially in high-flown novels and sentimental poems. For some considerable time it was the custom to make the characters weep copiously upon every possible occasion. Tears of joy, tears of grief, tears of anger, tears of indignation—tears, in short, whenever they could be dragged in, were with the writers of a past generation a standing rule; and in those days the character whose 'grief is too deep for tears' would have been regarded as a glaring anomaly, and as an absurd and impossible creation. Carlyle very truly observed that the eighteenth century was an age of 'shams and

windy sentimentalities;' but it must be noted that the great feature of the age was a reaction against false sentiment. This really set in during the latter half of the seventeenth century, at a period when *The Rehearsal* was produced to ridicule the extravagances of the 'heroic' plays of the Restoration. Other burlesques aimed at the same objects soon followed. Ten years before Fielding held up to ridicule 'the puny Cockney bookseller' who poured forth 'endless volumes of sentimental twaddle,' his *Tom Thumb* was produced; and in some notes which he added afterwards, he has transmitted to us many amusing examples of the stilted language of the plays then in vogue. In the first act of Fielding's burlesque, *King Arthur* says to Queen Dollalolla:

Ha! what wrinkled sorrow
Hangs, sits, lies, frowns upon thy knitted brow?
Whence flow those tears fast down thy blubber'd
cheeks,
Like a swollen gutter, gushing through the streets?

In explanation of this, the author observes that floods of this character are very frequent in the tragic writers, and quotes these examples from plays of the period:

Near to some murmuring brook I'll lay me down,
Whose waters, if they should too shallow flow,
My tears shall swell them up till I will drown.

Pouring forth tears at such a lavish rate,
That were the world on fire, they might have drown'd
The wrath of heaven, and quench'd the mighty ruin.

From another extract it would seem that the waters of grief may soon be changed to those of joy:

These tears, that sprung from tides of grief,
Are now augmented to a flood of joy.

The tears of another character drown the whole world:

Our swelling grief
Shall melt into a deluge, and the world
Shall drown in tears.

Sterne was, as everybody knows, an extensive dealer in tears, and his reference in *Tristram Shandy* to the tears of the recording angel is as well known as any passage in literature. Barham cleverly and characteristically parodied this in the *Lay of St Nicholas*:

The accusing Byers 'flew up to heaven's Chancery,'
Blushing like scarlet with shame and concern;
The archangel took down his tale, and in answer, he
Wept—(see the works of the late Mr Sterne).

Indeed, it is said, a less taking both were in
When, after a lapse of a great many years,
They book'd Uncle Toby five shillings for swearing,
And blotted the fine out again with their tears!

To compile an index to the references to tears in Sterne's works would be no slight task, because most of his characters were of what Mr Charles Jeames Yellowplush would call a 'mist constitution.' But to Mackenzie's *Man of Feeling*—much of which is written after the manner of the author of *Tristram Shandy*—there has been appended an index to the tears shed in the course of the attractive story, and a very interesting compilation it is, showing conclusively that, as Professor Henry Morley has observed, it can scarcely be called a

'dry' book. The compiler of this odd contribution to the curiosities of literature, who is careful to state that chokings, &c., are not counted, gives no fewer than forty-seven references to tears in that short work. In one instance, it will be remembered, Mr Atkins' daughter falls to the ground and 'bathes' her father's feet with her tears; while there are also several references to 'showers' of tears. As Mackenzie afterwards assisted in writing tracts against the doctrines of the Revolutionists—of which this absurd sentiment, so freely indulged in by Rousseau and Sterne, was a serious reflection—we may take it that his opinions with regard to tears underwent a change.

In the writings of those great realists in English fiction, Fielding and Smollett, tears do not play a very important part, nor do Scott and other great novelists deal much in extravagant sentiment; but for many years there was plenty of high-falutin' in the productions of some of the lesser fry. The famous Minerva Press poured out stuff of this kind in great quantities, keeping a number of the customary phrases ready composed in type, to facilitate printing, as Sydney Smith said, because the proprietor of the Press well knew that such phrases must form a part of every story he printed. Macaulay, who could read anything, used to skim through many of these sentimental novels, a specimen of one of the catastrophes in which has been recorded by his biographer. Literature of this character must have inspired a clever little skit, entitled *The Tears of Sensibility*, which Macaulay wrote; but the people to whom it was sent took it in sober earnest!

Of more modern novelists, Lytton undoubtedly stands at the head of the sentimental school. Whether he deserves all Thackeray's satire is, however, another matter. Thackeray himself was by no means sparing in his use of tears. In the course of *Vanity Fair* there are a good many instances in which the 'green eyes' of Becky Sharp 'looked up to heaven and filled with tears;' and as to sentiment, Alexander Smith said that the only faculty with which the great novelist gifted his good women was the supreme faculty of tears. Without going so far as this, it must be confessed that Thackeray's women are, to use his own phrase, 'uncommonly watery,' although they do not shed 'showers' or 'rivers' of tears, like the heroines of a past generation.

Every novelist has some pet idea, just as every man has some pet word or phrase; and Dickens's pet resource for producing humour was tears, of which he avails himself largely. Nearly all his humbugs are gifted with the power of producing at least one tear at command; and in *Martin Chuzzlewit* he runs through the whole gamut of tears—the tears of grief, the tears of joy, the tears of sentimental drunkenness, the tears of indignation ("Indignation," observed Mr Pecksniff, "will bring the scalding tear into the honest eye, I know"—he wiped his own elaborately), and the tears of hypocrisy—although perhaps the tears of indignation should be included with the latter. Of his use of tears for producing humour, only two examples need be quoted. Bailey junior expressed his contrition on a memorable occasion by 'affecting to wipe away scalding tears with his apron, and afterwards feigned to wring a vast amount of water out of that garment.' Of a letter which he intended to write to his aunt, Dick Swiveller

said: 'I mean to blot it a good deal and shake some water over it out of the pepper-caster, to make it look penitent. "I'm in such a state of mind that I hardly know what I write"—blot—"if you could see me at this minute shedding tears for my past misconduct"—pepper-caster—"my hand trembles when I think"—blot again.—If that don't produce the effect, it's all over.' These are two instances out of many in which Dickens makes use of tears with inimitable effect, and with all the little embellishments of which he was such a master. Dickens's humbugs, with their unlimited power of shedding crocodile tears, have frequently evoked criticism; but in the course of a controversy that has recently taken place on the 'Anatomy of Acting,' it was stated that anybody with a week's practice can produce tears at will. If this be true, the 'hebdomadal conferrers of immortality' are indeed confounded.

Obviously, Dickens often meant to ridicule the idea that tears are indispensable adjuncts to true feeling; and no doubt much of his satire in this direction accomplished its purpose. What influence his writings alone had in moulding the character of the fiction of to-day it is impossible accurately to determine; but that influence was undoubtedly great, and the fashion in literature at present is certainly not the ultra-sentimental. Emphatically, then, tears 'have had their day.' We have now, it is true, the novel of sentiment, the novel of romance, and what Mr Justin M'Carthy calls the 'conundrum sort' of novel; but we are all 'realists' so far as sentiment is concerned, and 'shams and sickly sentimentalities' are not at all likely to achieve any great popularity whilst the public taste remains as it is at present.

THEN AND NOW.

I.

Dost thou remember, love, how pale and wan
This lakelet ere the wintry days were gone,
With one green isle of glistening lily-leaves?

Dost thou remember, love, that starless night
When the winds ceased their sighing, in affright,
And birds were silent under cottage eaves?

Remembering, strive a moment, love, to guess
The woe of hearts unloved, their loneliness,
Their deathless pain no hour of rest relieves.

II.

How gleams the lake now in the summer light,
While drifting lilies, golden-hued and white,
Fling back a kindred splendour to the sun!

Ere that great darkness awed us into fear,
The silver moon soared slowly, full and clear,
To skies where night was ended, just begun.

So mayst thou know how gladly I saw afar
Thy own sweet face shine like a splendid star;
What peace closed round me when the prize was won.

BADGERS AND OTTERS.

HAZELHURST was a long line of woodland, on one side skirted by the sea, and on the other by a crumbling limestone escarpment. It was woodland with the deep impress of time upon it—a forest primeval. The branches and boles of the oaks were tortured out of all original conception. Save for colour, they might have been congealed water or duramen muscles. Down in the hollows there are deep moss, elastic and silent over all.

For centuries the pines had shed their needles undisturbed. These and the pine-trunks sent up a sweet savour from the earth, an odour that acted as a tonic to the whole being. There were sun-flashes in the grassy glades, where the jays chattered and the cushats cooed, and where ever and anon a rabbit rustled through. Often over these the kestrel hung and vibrated its shadow on the spot beneath; or the sparrow-hawk, with its clean-cut figure, stood with its foot on its prey on a dead pine bough. In the summer, red creatures that were bits of light gracefully glided among green tassels, and the chatter of squirrels was heard. The older trees attracted woodpeckers, and the nuthatch threw out fine fibres of rotten wood. Sometimes a pheasant or a partridge would startle, getting heavily up from its olive eggs by a log left by the charcoal-burners. Thus rudely disturbed, it has no time to scatter leaves over its nest, as is its wont. The shaggy and corrugated bark of the old trees was larvæ-haunted, and consequently mouse-like creepers abounded. These little creatures on every trunk showed conspicuously as they ran their marvellous adaptation to an end, and fulfilled it perfectly. All the wood-birds were there—the white-throat, the wood and the willow wren, the chiff-chaff and garden-warbler. These sang from the leafy boughs. But higher up towards the escarpment the floor of the wood was rugged and rock-strewn. Boulders had rolled from above, and among these dwelt weasels and ermines. There were at least a pair of martens,

and foxes from the fells had their tracks through the woods.

A primitive mansion had once stood in the wood, but now it was gone. It had been large; and green mounds, now laid low, marked out its dimensions. Old oak panellings, with long-gone dates, were sometimes dug up, and these were covered with carvings quaint and curious—‘all made out of the carver’s brain.’ Lying round this had been an extensive orchard, the rich though old trees of which remained. And now in this glorious summer-time the golden fruit fell unheeded to the ground. For Hazelhurst was long distant from town or nearest village. Brambles held their luscious fruit, and every species of ground-berry grew here. No wonder it was a paradise to mice and squirrels and birds. They revelled in nature’s ample provision, and were undisturbed.

Here, in the days of our immediate ancestors, badgers were plentiful. Now, where a ridge of rock ran through the wood there was a hole, the entrance to a somewhat spacious cavity. This could be seen for the seeking, not otherwise. Brambles protected it and ground-ivy. Black bryony and woodbine twisted up every available stem, and a knot of blackthorn grew over all. The spot was protected and dense. One day we invaded it; but after long crawling and sticking fast, had to return. In it lived the badgers—had done so time out of mind, and the few poachers who knew it called it ‘Brockholes.’ ‘Brock’ is the old north-country word for badger, and, as we have said, everything testified to its presence. In this wild-fruit paradise, at least two pairs of badgers bred. Each pair had more than one apartment—at least the young were not produced in that which formed the general abode. These were at the ends of the burrow, where were the beds, composed of roots and dried grass. The young were brought forth in April, and after about six weeks, might have been seen sitting about the mouth of their hole, or accompanying their dam to short distances when on her evening rambles. We always found the badgers un-

offending harmless creatures, unless first attacked. They fed almost entirely on roots, wild fruits, grain, and occasionally insects. They were, however, extremely shy and wary. Beautiful it was to see these creatures in summer searching for food among the bushes, occasionally giving a low grunt when some favourite root was turned up. When insects came within their reach they were snapped up somewhat after the manner of a dog catching flies.

The life of the badger is eminently that of a peaceful creature, harmless in all its ways, unoffending, interesting in its life-history, useful, and, above all, filled with a quiet contentment almost human. The body of the badger is long and heavy, and its legs short, which give it an awkward shambling appearance when running. Its beautifully shaped head has two long lines running from the snout to the tips of the ears. The upper parts of its body are light gray, becoming darker below; the under parts are quite black. The total length of a fully grown male badger is about thirty-six inches. Especially is the structure of the badger adapted to its mode of life, this being shown in the slender muzzle with movable snout which is employed in digging. It is when thus occupied, too, that the short stout limbs are seen fulfilling their end; and when no natural cavity exists, it is these limbs and snout that provide one. Both are brought into frequent requisition when digging for roots, of certain of which the badger is particularly fond.

Badgers are quite susceptible of domestication, and a friend had a pair which he led about in collars. They are possessed of great affection for their young, and rush blindly into danger, or even suffer themselves to be killed in attempting to rescue them.

We have stretched our length along a slab of rock which margins the bank and recedes far under it. The stream for the most part is rapid, but here narrows to slow black depth. Ever and ceaselessly does the water chafe and lap among the shelving rocks, and this, with the constant 'drip,' only makes the silence audible. Fungi and golden mosses light up our dark retreat. Never was green more green or lichen tracery more ravishing. Close-clinging and rock-loving is all life here. Water percolates through the bank and spreads its silver filament over all. Far out and beyond the deep wood it comes from the scaurs, and the limestone sends its carbonate to dome our retreat. Miniature stalactites hang from the roof, and bright bosses rise from the floor. Frail fern-fronds depend from the crevices; and as the light rushes in, masses of golden saxifrage gild all the chamber. The beams will not long stay, for the sun dips in the western woods.

From the mouth of our recess we take in a silent river-reach. It is thickly embowered and overhung. Long drooping racemes of green tree-flowers attract innumerable insects, especially those of the lime, and intent upon these, a fly-catcher sits lengthwise upon a branch. How beautiful in its short flights, the iridescence of its plumage, its white eye-lines, and barred forehead! Numerous small waterfalls, the gauze and film veils of which when the wind blows, and dripping moss, have attracted the dippers. Kingfishers too, in their green flight dash over the

still stream. The remote pines have lost their light, and stand black against the water. Sundown has come, and it is the hour of vesper hymns. The woods are loud-swelling volumes of sound. Behind us is a woodland enchanted, though with no sadder spirit than blackbirds and thrushes that whistle to cheer it. This loud evening hymn lasts for an hour, and then subsides, and the woods hush. The stem of the silver birch ceases to vibrate to the blackbird's whistle. The polyglot wood-thrush is dreaming of gilded fly and dewy morn, and finally that last far-off song has ceased. Silence—an intense holy calm—is over the woods. Chill comes, the dew rises, and twilight!—and the night-side of nature. How rich and varied is that of the stream-side! The fern-owls, with their soft plumage and noiseless flight, come out, as do the great moths and bustards.

This prevalence of life at the same time is as nature would have it—the one acting as food for the other. The beat of unseen pinions is heard above, but no object visible—some night-haunting bird flying off to its feeding-ground. Through the short summer night snipe whistle and wail. Newly arrived crakes call from the meadows, and a disturbed lapwing gets up crying from the green corn-stalks. Maybe the disturber was the hare, whose nearly human cry now comes from thorn-fence. For it, the corn-sprouts have come for the last time, and soon it will be in the poacher's wallet. A loud splash comes from the water, and a great black trout has sucked down its prey. This is a large-winged night-fly. The first splash is a token of more abundant night-food, and soon the reach boils. The crescent moon shows a bit of light at intervals; soon masses of cloud intervene. A faint whistle, unlike that of any bird, comes up stream, and although imperceptible, the dark still water is moved. The trout cease to rise. The whistle comes nearer, and then a rustle is heard. The osier beds are stirred, and some long dark object makes its way between the parted stems. It is an otter. He has been sent to reconnoitre, and all is safe. Then others come paddling down stream, and, arriving at the pool, stop, tumble and frolic, rolling over and over and round and round, and performing the most marvellous evolutions. They swing on the willow-spray, and dash with lightning velocity at a piece of floating bark, tumble with it, wrestle with it, and go through a hundred wonderful movements. They are motionless, then begin to play, and so continue for nearly an hour, when, as if suddenly alarmed, they rush down stream to their fishing-grounds, and leave us cold and benumbed. We plod through the meadow beneath the moon and stars, chilled to the marrow by the falling dew.

Otters are still abundant on the banks of most northern streams, as also among the rocks and boulders of the coast-line. Human invasion drives them from their haunts, although, where waters remain unpolluted, they not unfrequently pass up the rivers by towns and villages during the still night. Fitted for an aquatic existence, the structure of the otter beautifully exhibits the provisions suitable to its mode of life. On land it can travel swiftly, though the water is its best element. Immersed in this, its coat appears smooth and glassy. In pursuing its prey it performs the most graceful movements, doubling and

diving so rapidly that it is difficult to follow its movements. When fishing, its object is to get beneath the object pursued, as, from the construction of its eyes, which are placed high in the head, it is better enabled to follow its prey. This it seldom fails to secure. Its uniform dusky brown coat has, like all aquatic creatures, a soft underfur with long hair above.

The otter generally takes possession of a natural cavity, a drain, or a hole made by the inundation of the stream. The entrance is usually under water, and inclines towards the bank. Situations where the latter is overhung with bushes and with tall water-plants in the vicinity are generally chosen. From this, the young, when three or four weeks old, betake themselves to the water. If captured now, they may easily be domesticated. One of our friends has to-day a couple of young otters, which he leads about in a leash. At Bassenthwaite, a man and his son trained a pair of otters to fish in the lake. They would return when called upon, or follow their masters home when the fishing was over. The males in spring fight desperately; and once when hidden, we witnessed a fight which lasted two hours, and so engrossed did the combatants become, that we approached and, taking the part of the lesser, shot its aggressor.

And now a word as to the food of the otter. That it destroys fish we are not about to deny. But this liking for fish has become such a stereotyped 'fact' in natural history that it is glibly repeated, parrot-like, and so continues until most persons have come to accept it. The otter destroys but few fish, using the word in its popular acceptation. What it destroys are for food, and not out of love of killing. The greater part of its diet consists of fresh-water crayfish, thousands of which it destroys, and it is for these that long journeys are so frequently made. Many miles in a night are traversed for these crustaceans, the beds of mountain and moorland streams being tracked to their source, almost every stone on the way being examined. And at least upon two occasions have we found the remains of the water-hen after an otter's meal.

THIS MORTAL COIL.

CHAPTER XXIX.—ACCIDENTS WILL HAPPEN.

DURING the whole of the next week, the Squire and a strange artisan, whom he had specially imported by rail from London, went much about together by day and night through the grounds at Whitstrand. A certain air of mystery hung over their joint proceedings. The strange artisan was a skilled workman in the engineering line, he told the people at the *Fisherman's Rest*, where he had taken a bed for his stay in the village; and indeed sundry books in his kit bore out the statement—weird books of a scientific and diagrammatic character, chokefull of formulæ in Greek lettering, which seemed not unlikely to be connected with hydrostatics, dynamics, trigonometry, and mechanics, or any other equally abstruse and uncanny subject, not wholly alien to necromancy and witchcraft. It was held at Whitstrand by those best able to form an opinion in such dark questions, that the new importation was 'summat in the electric way;' and it was certainly matter

of plain fact, patent to all observers equally, that he did in very truth fix up an elaborate lightning-conductor of the latest pattern to the newly-thrown-out gable-end at what had once been Elsie's window. It was Elsie's window still to Hugh: let him twist it and turn it and alter it as he would, he feared it would never, never cease to be Elsie's window.

But in the domain at large, the intelligent artisan with the engineering air, who was surmised to be 'summat in the electric way,' carefully examined, under Hugh's directions, many parts of the grounds of Whitstrand. Squire was going to lay out the garden and terrace afresh, the servants conjectured in their own society: one or two of them, exceedingly modern in their views, even opined in an off-hand fashion that he must be bent on laying electric lights on. Conservative in most things to the backbone, the servants bestowed the meed of their hearty approval on the electric light: it saves so much in trimming and cleaning. Lamps are the bugbear of big country houses: electricity, on the other hand, needs no tending. It was near the poplar that Squire was going to put his installation, as they call the arrangement in our latter-day jargon; and he was going to drive it, rumour remarked, by a tidal outfall. What a tidal outfall might be, or how it could work in lighting the Hall, nobody knew; but the intelligent artisan had let the words drop casually in the course of conversation; and the *Fisherman's Rest* snapped them up at once, and retailed them freely with profound gusto to all after-comers.

Still, it was a curious fact in its own way that the installation appeared to progress most easily when nobody happened to be looking on, and that the skilled workman in the engineering line generally stood with his hands in his pockets, surveying his handicraft with languid interest, whenever anybody from the village or the Hall lounged up by his side to inspect or wonder at it.

More curious still was another small fact, known to nobody but the skilled workman *in propria persona*, that four small casks of petroleum from a London store were stowed away, by Hugh Massinger's orders, under the very roots of the big poplar; and that by their side lay a queer apparatus, connected apparently in some remote way with electric lighting.

The Squire himself, however, made no secret of his own personal and private intentions to the London workman. He paid the man well, and he exacted silence. That was all. But he explained precisely in plain terms what it was that he wanted done. The tree was an eyesore to him, he said, with his usual frankness—Hugh was always frank whenever possible—but his wife, for sentimental reasons, had a special fancy for it. He wanted to get rid of it, therefore, in the least obtrusive way he could easily manage. This was the least obtrusive way. So *this* was what he required done with it. The London workman nodded his head, pocketed his pay, looked unconcerned, and held his tongue with trained fidelity. It was none of his business to pry into any employer's motives. Enough for him to take his orders and to carry them out faithfully to the very letter. The job was odd: an odd job is always interesting. He hoped the experiment might prove successful.

The Whitestrand labourers, who passed by the poplar and the London workman, time and again, with a jerky nod and their pipes turned downward, never noticed a certain slender unobtrusive copper wire which the strange artisan fastened one evening, in the gray dusk, right up the stem and boles of the big tree to a round knob on the very summit. The wire, however, as its fixer knew, ran down to a large deal box well buried in the ground, which bore outside a green label, 'Ruhmkorff Induction Coil, Elliott's Patent.' The wire and coil terminated in a pile close to the four full petroleum barrels. When the London workman had securely laid the entire apparatus, undisturbed by loungers, he reported adversely, with great solemnity, on the tidal outfall and electric light scheme to Hugh Massinger. No sufficient power for the purpose existed in the river. This adverse report was orally delivered in the front vestibule of Whitestrand Hall; and it was also delivered with sedulous care—as per orders received—in Mrs Massinger's own presence. When the London workman went out again after making his carefully worded statement, he went out clinking a coin of the realm or two in his trousers' pocket, and with his tongue stuck, somewhat unbecomingly, in his right cheek, as who should pride himself on the successful outwitting of an innocent fellow-creature. He had done the work he was paid for, and he had done it well. But he thought to himself, as he went his way rejoicing, that the Squire of Whitestrand must be very well held in hand indeed by that small pale lady, if he had to take so many cunning precautions in secret beforehand when he wanted to get rid of a single tree that offended his eye in his own gardens.

The plot was all well laid now. Hugh had nothing further left to do but to possess his soul in patience against the next thunderstorm. He had not very long to wait. Before the month was out, a thunderstorm did indeed burst in full force over Whitestrand and its neighbourhood—one of those terrible and destructive east-coast electric displays which invariably leave their broad mark behind them. For along the low, flat, monotonous East Anglian shore, where hills are unknown and big trees rare, the lightning almost inevitably singles out for its onslaught some aspiring piece of man's handiwork—some church steeple, some castle keep, the turrets on some tall and isolated manor-house, the vane above some ancient castellated gateway.

The reason for this is not far to seek. In hilly countries the hills and trees act as natural lightning-conductors, or rather as decoys to draw aside the fire from heaven from the towns or farm-houses that nestle far below among the glens and valleys. But in wide level plains, where all alike is flat and low-lying, human architecture forms for the most part the one salient point in the landscape for lightning to attack: every church or tower with its battlements and lanterns stands in the place of the polished knobs on an electric machine, and draws down upon itself with unerring certainty the destructive bolt from the overcharged clouds. Owing to this cause, the thunderstorms of East Anglia are the most appalling and destructive in their concrete results of any in England. The laden clouds, big with electric energy, hang low and dark above one's very head,

and let loose their accumulated store of vivid flashes in the exact midst of towns and villages.

This particular thunderstorm, as chance would have it, came late at night, after three sultry days of close weather, when big black masses were just beginning to gather in vast battalions over the German Ocean; and it let loose at last its fierce artillery in terrible volleys right over the village and grounds of Whitestrand. Hugh Massinger was the first at the Hall to observe from afar the distant flash, before the thunder had made itself audible in their ears. A pale light to westward, in the direction of Snade, attracted, as he read, his passing attention. 'By Jove!' he cried, rising with a yawn from his chair, and laying down the manuscript of *A Life's Philosophy*, which he was languidly correcting in its later stanzas, 'that's something like lightning, Winifred! Over Snade way, apparently. I wonder if it's going to drift towards us?—Whew—what a clap! It's precious near. I expect we shall catch it ourselves shortly.'

The clouds rolled up with extraordinary rapidity, and the claps came fast and thick and nearer. Winifred cowered down on the sofa in terror. She dreaded thunder; but she was too proud to confess what she would nevertheless have given worlds to do—hide her frightened little head with sobs and tears in its old place upon Hugh's shoulder. 'It's coming this way,' she cried nervously after a while. 'That last flash must have been awfully near us.'

Even as she spoke, a terrific volley seemed to burst all at once right over their heads and shake the house with its irresistible majesty. Winifred buried her face deep in the cushions. 'O Hugh,' she cried in a terrified tone, 'this is awful—awful!'

Much as he longed to look out of the window, Hugh could not resist that unspoken appeal. He drew up the blind hastily to its full height, so that he might see out to watch the success of his deep-laid stratagem; then he hurried over with real tenderness to Winifred's side. He drew his arm round her and soothed her with his hand, and laid her poor throbbing aching head with a lover's caress upon his own broad bosom. Winifred nestled close to him with a sigh of relief. The nearness of danger, real or imagined, rouses all the most ingrained and profound of our virile feelings. The instinct of protection for the woman and the child comes over even bad men at such moments of doubt with irresistible might and majesty. Small differences or tiffs are forgotten and forgiven: the woman clings naturally in her feminine weakness to the strong man in his primary aspect as comforter and protector. Between Hugh and Winifred the estrangement as yet was but vague and unacknowledged. Had it yawned far wider, had it sunk far deeper, the awe and terror of that supreme moment would amply have sufficed to bridge it over, at least while the orgy of the thunderstorm lasted.

For next instant a sheet of liquid flame seemed to surround and engulf the whole house at once in its white embrace. The world became for the twinkling of an eye one surging flood of vivid fire, one roar and crash and sea of deafening tumult. Winifred buried her face deeper than ever on Hugh's shoulder, and put up both her small hands to her tingling ears, to crush if possible the

hideous roar out. But the light and sound seemed to penetrate everything: she was aware of them keenly through her very bones and nerves and marrow; her entire being appeared as if pervaded and overwhelmed with the horror of the lightning. In another moment all was over, and she was conscious only of an abiding awe, a deep-seated after-glow of alarm and terror. But Hugh had started up from the sofa now, both his hands clasped hard in front of his breast, and was gazing wildly out of the big bow-window, and lifting up his voice in a paroxysm of excitement. 'It's hit the poplar!' he cried. 'It's hit the poplar! It must be terribly near, Winnie! It's hit the poplar!'

Winifred opened her eyes with an effort, and saw him standing there, as if spellbound, by the window. She dared not get up and come any nearer the front of the room, but, raising her eyes, she saw from where she sat, or rather crouched, that the poplar stood out, one living mass of rampant flame, a flaring beacon, from top to bottom. The petroleum, ignited and raised to flashing-point by the fire which the induction coil had drawn down from heaven, gave off its blazing vapour in huge rolling sheets and forked tongues of flame, which licked up the crackling branches of the dry old tree from base to summit like so much touchwood. The poplar rose now one solid column of crimson fire. The red glow deepened and widened from moment to moment. Even the drenching rain that followed the thunder-clap seemed powerless to check that frantic onslaught. The fire leaped and danced through the tall straight boughs with mad exultation, hissing out its defiance to the big round drops which burst off into tiny balls of steam before they could reach the red-hot trunk and snapping branches. Even left to itself, the poplar, once ignited, would have burnt to the ground with startling rapidity; for its core was dry and light as tinder, its wood was eaten through by innumerable worm-holes, and the hollow centre of mouldering dry-rot, where children had loved to play at Hide-and-seek, acted now like a roaring chimney flue, with a fierce draught that carried up the circling eddies of smoke and flame in mad career to the topmost branches. But the fumes of the petroleum, rendered instantly gaseous by the electric heat, made the work of destruction still more instantaneous, terrible, and complete than it would have proved if left to unaided nature. The very atmosphere resolved itself into one rolling pillar of fluid flame. The tree seemed enveloped in a shroud of fire. All human effort must be powerless to resist it. The poplar dissolved almost as if by magic with a wild rapidity into its prime elements.

A man must be a man come what may. Hugh leaped towards the window and flung it open wildly. 'I must go!' he cried. 'Ring the bell for the servants.' The savage glee in his voice was well repressed. His enemy was low, laid prone at his feet, but he would at least pretend to some spark of magnanimity. 'We must get out the hose!' he exclaimed. 'We must try to save it!' Winifred clung to his arm in horror. 'Let it burn down, Hugh!' she cried. 'Who cares for the poplar? I'd sooner ten thousand poplars burned to the ground than that you should venture out on such an evening!'

Her hand on his arm thrilled through him with horror. Her words stung him with a sense of his meanness. Something very like a touch of remorse came over his spirit. He stooped down and kissed her tenderly. The next flash struck over towards the sandhills. The thunder was rolling gradually seaward.

Hugh slept but little that eventful night; his mind addressed itself with feverish eagerness to so many hard and doubtful questions. He tossed and turned and asked himself ten thousand times over—was the tree burnt through—burnt down to the ground? Were the roots and trunk consumed beyond hope—or rather beyond fear—of ultimate recovery? Was the hateful poplar really done for? Would any trace remain of the barrels that had held the tell-tale petroleum? any relic be left of the Ruhmkorff Induction Coil? What jot or tittle of the evidence of design would now survive to betray and convict him? What ground for reasonable suspicion would Winifred see that the fire was not wholly the result of accident?

But when next morning's light dawned and the sun arose upon the scene of conflagration, Hugh saw at a glance that all his fears had indeed been wholly and utterly groundless. The poplar was as though it had never existed. A bare black patch by the mouth of the Char, covered with ash and dust and cinder, alone marked the spot where the famous tree had once stood. The very roots were burned deep into the ground. The petroleum had done its duty bravely. Not a trace of design could be observed anywhere. The Ruhmkorff Induction Coil had melted into air. Nobody ever so much as dreamed that human handicraft had art or part in the burning of the celebrated Whitestrand poplar. The *Times* gave it a line of passing regret; and the Trinity House deleted it with pains as a lost landmark from their sailing directions.

Hugh set his workmen instantly to stub up the roots. And Winifred, gazing mournfully next day at the ruins, observed with a sigh: 'You never liked the dear old tree, Hugh; and it seems as if fate had interposed in your favour to destroy it. I'm sorry it's gone; but I'd sacrifice a hundred such trees any day to have you as kind to me as you were last evening.'

The saying smote Hugh's heart sore. He played nervously with the button of his coat. 'I wish you could have kept it, Winnie,' he said not unkindly. 'But it's not my fault.—And I bear no malice. I'll even forgive you for telling me I'd never make a poet; though that, you'll admit, was a hard saying. I think, my child, if you don't mind, I'll ask Hatherley down next week to visit us.—There's nothing like adverse opinion to improve one's work. Hatherley's opinion is more than adverse. I'd like his criticism on *A Life's Philosophy* before I rush into print at last with the greatest and deepest work of my lifetime.'

That same evening, as it was growing dusk, Warren Relf and Potts, navigating the *Mud-Turtle* around by sea from Yarmouth Roads, put in for the night to the Char at Whitestrand. They meant to lie by for a Sunday in the estuary, and walk across the fields, if the day proved fine, to service at Snade. As they approached the mouth they looked about in vain for the familiar landmark. At first they could hardly believe

their eyes: to men who knew the east coast well, the disappearance of the Whitestrand poplar from the world seemed almost as incredible as the sudden removal of the Bass Rock or the Pillars of Hercules. Nobody would ever dream of cutting down that glory of Suffolk, that time-honoured sea-mark. But as they strained their eyes through the deepening gloom, the stern logic of facts left them at last no further room for syllogistic reasoning or *a priori* scepticism. The Whitestrand poplar was really gone. Not a stump even remained as its relic or its monument.

They drove the yawl close under the shore. The current was setting out stronger than ever, and eddying back against the base of the roots with a fierce and eager swirling movement. Warren Relf looked over the bank in doubt at the charred and blackened soil beside it. He knew in a second exactly what had happened. 'Massinger has burned down the poplar, Potts,' he cried aloud. He did not add, 'because it stood upon the very spot where Elsie Challoner threw herself over.' But he knew it was so. They turned the yawl up stream once more. Then Warren Relf murmured in a low voice, more than half to himself, but in solemn accents: 'So much the worse in the end for Whitestrand.'

All the way up to the *Fisherman's Rest* he repeated again and again below his breath: 'So much the worse in the end for Whitestrand.'

(To be continued.)

THE LAND OF FIRE.

READERS of the recently published *Life of Charles Darwin* will remember that during his voyage in the *Beagle* the great naturalist saw something of Tierra del Fuego; and the account he gives of the country serves to remind us what an unimportant and little known part of the world it is. We have most of us a vague notion that it is a desolate region in the extreme south of South America, inhabited by savages; but few of us are prepared to commit ourselves to any more definite statements regarding it. Even geographical specialists have, until recently, known but little about the country, as, since its discovery by Magellan in 1520, it has remained almost unnoticed and unexplored, the occasional efforts which have been made in that direction having been partial and unsuccessful. For this, physical causes are largely responsible. Owing to the rough seas and persistent winds which during a great part of the year prevail along its shores, sailing vessels doubling Cape Horn have taken care not to approach the land too closely, and as a rule sight only some small islands off the south, which English sailors know as the Digarameries, a corruption of Diego Ramirez, the name bestowed on them by the Spaniards. The passage through the Strait of Magellan is, owing to currents and devious channels, only practicable for steamers, and even this class of vessels has only recently begun to make use of that route. It is not surprising, therefore, that Tierra del Fuego has hitherto attracted but little attention, and that the busy world has been content to let it alone. Of late, however, circumstances have arisen which give

the country interest and supply information about it.

Within the past five years it has been the subject of more thorough and scientific investigation than has ever been previously attempted. Lieutenant Bové, of the French navy, has, by permission of the Argentine government, and partly under its patronage, made an expedition to the south-east portion of Tierra del Fuego; and his labours have resulted in a valuable Report on the fauna, flora, and general characteristics of the country, and the condition and language of the people. Another even more valuable contribution to our knowledge on the subject has been made by the Rev. Thomas Brydges, a Church of England missionary, who has lived in the south-eastern part of Tierra del Fuego for over twenty-five years, and has during that long residence accumulated an important amount of information about the country and its inhabitants. Mr Julius Popper, a man of scientific antecedents, has also, on behalf of a Mining Company, recently made an expedition right across the country from Useless Bay on the west to San Sebastian on the east, and thence along the coast. Lastly, Don Ramon Lista, a well-known explorer, and a member of the Geographical Society of Buenos Ayres, has just returned from a scientific and geographical expedition to the east and south-east coasts, undertaken at the instance of the Argentine government. These combined sources of information have served to correct many errors hitherto current about the country, and to add to our knowledge in many important respects.

The group of islands which form the archipelago of Tierra del Fuego have an area of about eighty thousand square miles, nearly the same size as England and Scotland. Darwin describes the country as 'a mountainous land, partly submerged in the sea, so that deep inlets and bays occupy the place where the valleys should exist. To find an acre of level land in any part of the country is most rare.' Don Ramon Lista, however, who has had greater and more recent opportunities of investigation, thinks this description a mistaken one. He describes Argentine Tierra del Fuego as presenting two aspects: in the north, there are valleys more or less extensive, covered with splendid groves, and irrigated by large rivers, some of which are navigable; this region enjoying an agreeable temperature, with very little snow during the winter. South of this he reports that the appearance of the country changes, and extended forests appear, where the grass is not so abundant or the rivers so large. The face of the land is in this part something like Switzerland, with small lakes, elevated mountains, and valuable timber forests. He seems to think the country capable of great development, for he adds: 'On the plains there will yet be planted a great pastoral industry, while I believe the mountains will be found to contain valuable mineral deposits.'

The geological formation of Tierra del Fuego corresponds with that of Patagonia; its mountains are the continuation and southern extremity of the Andes; whilst the plains and uplands correspond to the Patagonian steppes. In some parts the formation is decidedly volcanic; pumice-stone is found in large quantities, and granite and quartz are abundant. On the other

hand, limestone, iron, and coal seem to be wanting. Gold has been found in considerable quantities in the north, and for a number of years the enterprising Chilians have been washing it at the foot of the chain of hills which forms the coasts of Useless and Future Bays. The climate is certainly not the best in the world, but its disadvantages seem to have been a good deal exaggerated by casual visitors, who have perhaps been unfortunate as to times and localities. Mr Brydges tells us that in the humid regions of the west, frosts are almost unknown; while in the central and eastern parts, where the sky is nearly always cloudless, there is intense cold during the four months from June to September. He adds, that the want of sufficient heat in summer is the great drawback to the climate, and is a greater inconvenience than the cold in winter, which has never been known to be lower than twelve degrees Fahrenheit, while the highest summer temperature is only seventy-five degrees. If it were not for the raw, damp winds, the climate of Tierra del Fuego would be much better than that of Canada. While there are probably few streams in the country which are of sufficient size ever to be utilised for navigation, there is a large number of small rivers and watercourses, which carry off the rains and melted snow from the mountains, and thus assist to irrigate the lower plains.

Travellers' reports as to the inhabitants of Tierra del Fuego have been conflicting. Some visitors have reported the natives to be stalwart, fine-looking men, and others have described them as small and abject beings. Darwin, whose scientific investigations were confined to the south of the country, says that 'one can hardly believe them to be fellow-creatures and inhabitants of the same world.' On the other hand, other explorers in the north and north-west describe the Fuegians as powerful men of large stature and warlike instincts. This apparent discrepancy seems to be due to the fact that the land is inhabited by two very distinct races of Indians. Mr Brydges, whose long residence in the country enables him to speak with authority on this point, assures us that there are two separate and distinct tribes dwelling in Tierra del Fuego. He calls them, as they call themselves, Onas and Yahgans; the former living in the north, and the latter in the south. The Onas seem to be almost identical in character, manners, and language with the Tuelche Indians of Patagonia. Like them, they use bows and arrows in the chase, and are muscular, active, and well formed. Their number is now much reduced, an epidemic of measles having been very fatal among them a few years ago, and the whole tribe probably does not now number more than five hundred persons. They are nomadic, and live principally in portable tents, covered with guanaco skins. Mr Popper did not form a high opinion of their intellectual faculties, judging from the primitive nature of their implements. He describes their tools as consisting for the most part of pieces of iron, taken from some vessel cast on shore, and tied to pieces of wood by leather thongs. They have no canoes, and do not fish, though they pick up on the shore such fish as are left behind after heavy tides. Their only water-vessels are large shells; but they display some ingenuity in making arrows and baskets.

The Yahgans, who inhabit the southern portion of Tierra del Fuego, are an altogether different people from the Onas, and have with some reason been considered as the most miserable species of humanity in the western hemisphere. They are quarrelsome and treacherous, and are governed entirely by their desires and passions. Very dexterous in the management of canoes, they live largely by fishing, but are very destitute even of the simplest appliances for cooking and comfort. Some of the tribe are of fair size, but others are extremely diminutive and abject looking. Mr Brydges, however, who has lived among them nearly a quarter of a century, says they are not so degraded as they have been represented, and he particularly repudiates the charge of cannibalism which has been made against them. They have been found capable of some small measure of civilisation, but, like the Onas, have suffered severely from epidemics, especially from smallpox. Their number is now considerably below three thousand. Mr Brydges describes their language as 'soft, rich, and very full;' how rich and full, may be inferred from his almost incredible statement that he has accumulated a vocabulary of no fewer than thirty thousand words. To find such a wealthy language among so low a race is a curious circumstance, and one worthy of consideration by ethnologists.

Such are a few of the latest particulars about this little-known territory. Even the name by which it is known is a misnomer, it being a land of frost rather than a land of fire. It received the latter title from its discoverer, Magellan, who, when passing its northern coasts, noticed night after night a succession of small fires, which he supposed to be due to some mysterious natural causes. In reality, they were beacons lighted by the natives; but the original mistake has given a permanent name to the country, and is typical of many other mistakes which have since been made about it.

MIN:

A RAILROAD STORY OF THE FAR WEST.

CHAPTER V.—CONCLUSION.

It was towards the close of the afternoon, and Mr Ferris was preparing to leave his office for the day, when the door opened to admit a man who was rather 'seedy' in his appearance, and whose once handsome face bore unmistakable traces of recent dissipation. The Superintendent turned an inquiring glance at his visitor, whom he evidently did not recognise; but Min, who was the only other occupant of the room, felt sure that she had seen the fellow before. It was Sam Ripley, the discharged engineer of No. 404! Ripley was not actually intoxicated, but he had evidently reached that stage of chronic drunkenness when the brief intermissions of comparative sobriety are so nearly akin to intoxication, that steadiness of step and clearness of speech are impossible achievements. For some reason or other, the ex-engineer felt disposed to be insolent. Without removing his cap, he addressed Superintendent Ferris: 'How do, boss!'

'Well, my man, what is it?'

'Don't take a feller up so short, boss—don't sound well. My name's Ripley—Samuel J. Ripley. Don't 'pear to remember old acquaintances? Strange, too. You orter know me, 'cause you fired for me one night when I handled the throttle of old 404 an' took your special from 'Stan'ople to Prairie City. Good joke on you as well as on me, wasn't it?—Ah, I see you remember!'

'Yes, sir; decidedly I remember it all. I wonder that you have the consummate impudence to come into my office, when, if your deserts were dealt to you, a gaol should hold you. Doubtless, you have some extraordinary reason for intruding—let's hear it.'

'Very good, boss. I came for a pass to Prairie City.—Yes, sir, I said a *pass*. Write it out favour of Samuel J. Ripley, Chicago to Prairie City, Nebraska; an' if you feel like throwing in a five-dollar bill, so much the better.'

'Are you crazy, man?' inquired the official.

'No, mister, I am *not* crazy—not even "chuck" at the present moment; an' if you will listen to me for a minute, I think you will fill out the pass.'

Here Ripley winked in the direction of Min—in whom he had not recognised the prairie waif he had often seen at 44-mile—as much as to ask if he should speak out before the girl.

Ferris understood the gesture. 'You can speak before that young lady,' he said. 'She hears all my business, and can keep it to herself.'

'Very good, boss; it don't make no difference to me. Now, I'm bound to get down Prairie City way. You see, whisky's pretty nearly got the best o' me, an' before long I expect to turn up my toes to the daisies. Before that there melancholy time arrives, I've got a leetle bizness to transact with that darned meddlin' operator who spoiled my little game that night with the special.—Don't say a word, boss; I hain't got nothin' against *you* for that. You was the boss—it was your bizness to checkmate us, if you could. But that there sneakin' agent—bah! What bizness had he to interfere with us fellers? It was none o' *his* funeral! So I'm goin' to have a leetle bit of a reck'nin'. Mebbe I'll git the worst of it—mebbe I won't. He played his cards; now, I'll play mine; an' if I can take the odd trick, why, Sam Ripley'll be ahead of the game. Very well. I ain't strong enough to tramp over a thousand miles, and I've got no money; consequently, I must have a pass.'

'This is all idle talk and wasted breath, Ripley,' said the Superintendent. 'I care nothing about your private grudges, and in any case would not assist you in your evil designs against a man who did his duty, and perhaps saved my life.—No, sir; no pass.'

'Stop a minute, boss,' interrupted Ripley. 'So far my story hasn't interested you, and hasn't done me much good. You're a big man amongst railroaders, and you've got a big record all through the West for being a smart, shrewd, and conscientious manager. That's so, isn't it?'

Ferris nodded his head, in assent.

'Well, be careful you never lose that record. Listen! About twelve years ago I was working on a railroad in Indiana. There were a couple of clever boys, brothers, in the Train Despatcher's Office. The oldest was the Chief

Despatcher himself, and the younger was his assistant. One night there was a nasty collision.' Ripley paused as he noticed Robert Ferris's face grow deathly pale, while his hands trembled violently.

Ferris recovered his composure quickly, though his voice was rather unsteady as he asked: 'What is all this twaddle to me?'

'Oh, nothing, nothing, boss.—Shall I go on?'

'Yes; but cut it short.'

'Very good, boss.—I think you know that story pretty well. Perhaps you don't know that the young fellow is still alive, and sees you once in a while?—Oh, he's no friend of mine; curse him! and I shouldn't get the story into the newspapers to help *him*.—But if I should take it into my head to resurrect that little affair, and start some smart Chicago reporter investigating, it might prove rather embarrassing for that older brother, don't you think?'

But Robert Ferris was already filling out a blank trip pass, which he handed to Ripley together with a five-dollar bill. 'Be careful, my lad,' said the Superintendent, as the whisky-soaked rascal shambled out of the office.

Min had heard every word of this strange conversation, and it came to her as a painful two-fold revelation. She could not doubt that Ripley meant to harm Macpherson in some way; nor could she believe otherwise than that Robert Ferris was the elder brother for whom Arthur had given up name and fame. Either of these discoveries was sufficient to decide Min as to her future course. She must warn and assist Arthur, which she could only thoroughly do by at once proceeding to 44-mile; and her sense of pride, as well as loyalty to Arthur, would not permit her to retain a position in the office of such a man as Robert Ferris.

The Superintendent had left, having followed closely on the heels of Ripley. Min did not mind that, however, for she would not have accepted the favour of a pass at his hands, and she did not feel like bidding him a courteous farewell. So she left a note on Ferris's desk, telling him that she had left Chicago as well as his employ, and that she would write to him shortly, giving her reasons in detail. That night she bought a ticket, and boarded the Pacific Express on the C. R. M. & P.

About thirty-six hours later, the long and heavy train drew up at 44-mile, and agent Macpherson was greatly surprised to find that it became necessary for him to assist a young lady to alight. She was a very pretty and very graceful young lady, becomingly apparelled in a perfect-fitting dress and sacque, while upon her head she wore a hat that displayed the good taste of a graduate in the milliner's art. Arthur thought there must be some mistake, till he saw the well-remembered face. 'Min!'

'Dear old Arthur!'

They held each other's hands as the train steamed away across the prairie, from which the night-mists were rolling before the morning sunlight, and then, hand in hand, they walked into the little office. For several minutes neither spoke; but in those first moments, as they gazed each into the other's eyes, all secrets and all misunderstandings seemed to roll away and disappear with the prairie mists outside: they loved

with a deep, true, and lasting love that was intensely mutual—and both knew it.

‘I’ve come back, Arthur—to you.’

And for answer Arthur took her in his arms and kissed the fresh red lips which were to be his for evermore. The lonely life, that had been hungering and thirsting for love, was more than satisfied.

Of course there were many questions to ask and to answer, Min perhaps having the most to tell. ‘I know everything now, Arthur. I know who you are, and who Mr Ferris is. I know, too, that Sam Ripley will find it hard work to do you much harm, when he discovers that he has two to fight instead of one. Besides, forewarned is forearmed, and if I ever see Mr Ripley around this place, I shall let him know that it was I who sat in the Superintendent’s office and overheard the recital of his schemes.

Later in the day, Min disclosed a plan of her own. ‘Now, Arthur, you know I am not a “child of the plains” any longer. I am a Chicago young lady, who cannot plead ignorance of the proprieties. I want to stay right here, and never leave 44-mile again until we leave together. But to do that we must be married—you did ask me, didn’t you?—and I want the wedding to be in the dear old depot. The Atlantic Express still goes through at two o’clock in the morning, I believe? Very well. You take that train to New Constantinople, hunt up a minister, and bring him out here as soon as you can.—You might bring Ratty Sykes along as a witness. Isn’t that a good and practicable plan?’

‘It is splendid,’ said Arthur, highly delighted to find that the girl was so thoroughly in earnest. ‘Only you will have to take charge of the station while I am gone.’

‘Of course. From now, on, I resume my position as assistant-operator at 44-mile.’

So at two o’clock on the dark and chill October morning, Arthur took the train as a passenger for Constantinople. When he boarded the front coach he did not notice in the darkness a man who alighted from the rear car; nor did the passenger who disembarked see the agent as he stepped on to the train. The new arrival at 44-mile evidently wished to remain unnoticed, for, instead of entering the little depot, he ensconced himself behind a pile of firewood which stood perhaps a dozen yards from the shanty. The man bore a striking resemblance to the ex-engineer Sam Ripley, and he repeatedly muttered to himself as he eyed the little curtained window of the telegraph cabin, behind which the light was dimly burning.

Min stood just inside the doorway as she watched Arthur take his departure; then she stepped in and closed the door. The morning was very chilly, and the fire had burned quite low. Upon the wall she saw an old hat and coat of Arthur’s which she remembered well. She had often worn them in the days gone by; why not now? So she put them on, and somehow, the familiar dress of the man she loved seemed to make her less lonely. Then she sat down upon the worn kitchen-chair at the shabby ink-stained telegraph table, and with the finger of an expert rattled off a message to Constantinople, informing them that the Atlantic Express had left 44-mile. That done, she threw herself

into Arthur’s armchair, which stood exactly midway between the lamp and the low window on the west side of the room. Her back was toward the window, and the light threw the shadow of her head and shoulders upon the curtain. So she sat, and gave her fancies loose rein, as they carried her forward into the future—the future which would know her as Arthur Macpherson’s wife.

Outside, in the cold night, the man behind the woodpile muttered and cursed. He was shivering, and, as he shivered, his courage—such as it was—began to ooze away. ‘Curse him! why not? He spoiled my game, and lost me my job. He ruined me and sent me to the dogs. He might as well have killed me.—Ah, no better chance than this! This is luck, Sam, my boy!’ The villain spoke thus as the shadow of a man’s head and shoulders fell distinctly across the window. Ripley knew that hat; he had seen Macpherson wearing it many times. He pulled from his hip-pocket a loaded revolver; he cocked it, levelled it, and fired. With the crack of the report, there was the noise of shattered glass, but never a cry or a sound from the girl who had sat in that chair dreaming her happy day-dreams. The bullet had done its work well. Min was dead.

This was Min’s home-coming! Of Arthur’s, a few hours later, why should we write? Why prolong the details of this simple and sad record of a girl’s short life? To this day there is a station at 44-mile, and Arthur Macpherson, a broken-hearted man, is still the agent and operator. The mills of the gods have not yet brought Robert Ferris beneath their ponderous wheels; for Arthur’s silence will last till death, and the bones of the only other man who held the secret of the collision lie bleaching on the prairies.

The sweet breezes of summer and the howling blizzards of winter, as they sweep around the lonely cabin at 44-mile, also kiss—gently or fiercely—a white marble slab upon which is chiselled MIN.

THE SPONGE-FISHERIES OF THE MEDITERRANEAN.

THE following interesting information as to the sponge-fisheries of the Mediterranean, which appeared in *The Board of Trade Journal*, is extracted from a paper contained in the Proceedings of the Constantinople Chamber of Commerce:

The principal places from which sponges are exported are situated in the eastern portion of the Mediterranean. The only exception is the Bahamas, in the West Indies. The Bahama sponges, however, are the poorest in quality which reach the market. The sponge of Tunis, from the extreme resistance of its tissue, is an article of general utility, for it can be put to the commonest uses. The most valuable sponges, however, are those which come from the coast of Syria and the Greek Archipelago.

The depth of the water beneath which it is found has a great influence on the quality of the sponge. That which is gathered on a rocky or sandy bottom is much superior to that which grows upon a muddy ground. The best Tunis sponges are of the former character, and are prin-

cipally found near Kerkeni and on the rocks of the little island of Kamontes. The inferior quality comes from the Gulf of Gabes, where the bottom is muddy, and these have unhealthy-looking red roots. In a natural condition, the Tunis sponge is black and covered with a viscous matter which forms the polyp of the sponge, and contains a considerable quantity of sand and mud.

In the Tunisian waters the sponge-fishery is carried on most actively and profitably during the months of December, January, and February. The late autumnal storms have by that time cleared the sponges of the seaweeds and other plants which concealed them, and the eye can easily detect them. It is considered, calm weather and a transparent sea being indispensable, that not more than forty-five days can be counted upon each season. The men employed in the Tunisian sponge-fishery are almost exclusively Greeks or Sicilians, and the former are found the more skilful. There are several modes of collecting sponges. They are plucked with the hand by help of a diving-bell, they are harpooned, or they are dragged up with an instrument which resembles the sort of drag used for fishing up oysters. The diving-bell can only be used where there is a hard bottom, and the harpoon is the instrument mainly employed by sponge-fishers.

The Arabs go out in parties of five, six, or seven persons in a small boat. One man holds the trident and watches the bottom of the sea, striking where he sees a sponge; but the Arabs are rarely successful in a depth of more than eight or ten metres. The method of the Sicilians is almost the same as that of the Arabs, except that their boats take only two men, one to row and the other to strike. The Sicilians fish in deeper water than the Arabs, and secure more sponges than they, and of a better quality. The Greeks, who for the most part come from Kalimno and Syria, are the chief employers of the drag. But the great majority of these also hold to the trident, which they use with extraordinary cleverness.

The island of Kalimno, on the south-western coast of Asia Minor, between Cos and Leros, contains a population of about twelve thousand, all the adult males being engaged in the sponge-fishery. They leave the island in May, and return in September at the latest. The islanders of Kalimno exercise their profession of sponge-fishers off the shores of the islands of the kingdom of Greece, of the Southern Sporades, and specially of Rhodes, of Crete, of the whole extent of Syria, of the island of Ruad, and finally of Tunis, where their vessels are so large and so well manned that they drive the Arabs and Sicilians completely out of the field. They take the sponges back to Kalimno, where they are sold, the council of the island constituting a court which decides all differences between fishermen, captains, proprietors, merchants, and retail purchasers. The Kalimniotes usually fish at a depth of from fifteen to twenty feet; below this there are no sponges which possess any commercial value. The divers have to be men of adult age and of great physical strength; they can in no case remain at the maximum depth of twenty feet for more than two minutes. They select the good from among the bad sponges by touch, tearing away those which seem to be the best, and place them in a pouch

fastened round the neck. Quite recently a new method has been adopted, the wearing of a water-tight diving-dress called a *scaphandro*, made of metal and provided with glass windows; in this dress men are able to remain at the bottom of the sea for two or three hours and collect the sponges at their ease.

The Kalimniote fishermen are in the habit of dividing the sponges which they sell into three classes—those of fine quality, those which are large in size, and those which are inferior in quality, which they call *tsimouches*. The island possesses two hundred vessels engaged in this industry. The Kalimniotes find that the largest and most delicate sponges are discovered on the coast of the little island of Stambalia, off Amorgo, and on one or two spots on the African littoral. The second quality are those of Crete, of Bengazi, of Rhodes, and of Syria. The sponges of the Kalimniotes find their way into almost all the markets of the world. England is the largest consumer; and France, Germany, Russia, Austria, and Italy follow.

An industry in artificial sponges is in process of creation. M. Oscar Schmidt, Professor at the University of Grätz, in Styria, has invented a method by which pieces of living sponge are broken off and planted in a favourable spot. From very small cuttings of this kind, Professor Schmidt has obtained large sponges in the course of three years and at a very small expense. One of his experiments gave the result that the cultivation of four thousand sponges had not cost more than two hundred and twenty-five francs, including the interest for three years on the capital expended. The Austro-Hungarian government has been so much struck with the importance of these experiments that it has officially authorised the protection of this new industry on the coast of Dalmatia.

A MILITARY MANŒUVRE.

CAPTAIN HUGH FLUKER was a quiet, unobtrusive man, upon whom certain youthful subalterns had bestowed the cognomen of 'the fossil.' Though he was steady and prosaic, nevertheless everybody in the Royal Slopshire Regiment voted him one of the best officers that ever held Her Majesty's commission. He was rather elderly, with iron-gray hair, a well-trained military moustache, and a pleasant expression; he dressed faultlessly, and was always the pink of politeness. Frequently he might have been seen walking along the shady side of the High Street at Blankford, where the regiment was quartered, and upon such occasions he peered a good deal under the bonnets of the pretty women; but there was a demure expression in his glance which withered any rising feeling of resentment. His age and his unmistakably sympathetic half-smile gave him an immunity which would not be extended to younger and bolder men.

At the mess of the Royal Slopshire the merits and demerits of the damsels of Blankford, marriageable and otherwise, were nightly discussed, and more than once had 'the fossil' been twitted with his apparent lack of interest in the fair sex. But he had shaken his head, and replied with a grave smile, almost of sadness, that his days of flirtation were over, that such

things must be left to the boys. His brother-officers had not failed to notice his gravity, and hence the popular belief that he had been crossed in love. Though Captain Fluker was a member of the Blankford Club—an institution where everybody knew everybody else, and where old fogies played whist for points not exceeding one penny—and his conduct in public was most exemplary, yet somehow he had but few friends. The men who ought to have been in his set—or of whose set he ought to have been—did not care for his company. Nor did the female leaders of Blankford society give him great countenance, for, if the truth must be told, he was 'horribly slow,' and it was generally admitted that there was something queer about Fluker. Though he led the almost idyllic life of a grave, sedate, old bachelor, yet somehow Blankfordians had an indefinable distrust in him which was utterly unaccountable.

The denizens of Blankford were a set of cheerful people who clubbed together their resources to make the time pass pleasantly, and who made no attempt to outshine one another. But on the arrival of the Royal Shropshire from Egyptian deserts, everything suddenly changed, and the residents—especially those possessed of the marketable commodities yclept 'marriageable daughters'—began to show off and give junketings upon the most approved principle, presumably in the hope of capturing some of the heroic officers. Those holding commission in the regiment thoroughly enjoyed themselves; but Captain Fluker held aloof from most of these pomps and vanities, and shunned the husband-huntresses.

This sort of thing went on for a year, when a whispered rumour caused much consternation in the garrison. It was, that 'the fossil' had actually entered for the matrimonial stakes. Such a proceeding was so unlikely, that it was considered a huge joke, until somebody at mess announced as a positive fact that the fair lady was none other than Miss Prudence Grimes. This was greeted by a good deal of laughter, for the lady in question was a rawboned spinster of fifty, who lived with her sister in a prim little cottage on the London Road.

'By Jove,' exclaimed the Honourable Bertie Oofington, an affected and moustacheless young sub, 'always thawt "the fossil" would go in for lucre and ugliness. But he's been confoundedly quiet over it.'

'Yes; they say he's been engaged to her for months, and that's why he don't mix with the gay element of ours,' remarked his neighbour.

'Engaged! is he?' echoed a dozen voices.

'Yes; going to marry her in a few weeks, if all I hear be true.'

'Suppose he'll retire on his wife's income,' observed Oofington. 'But I say, you Johnnies, I wish we could have a spree with him before he's spliced.'

A dozen voices assented to this proposal; and various modes of hoaxing 'the fossil' were at once suggested.

Whilst this conversation was in progress, Captain Fluker sat in the cosy little drawing-room at Yew Cottage. He had negotiated a *recherché* dinner just to his taste, and was now alone with his *fiancée*. Prudence Grimes was by no means a giddy young thing. She wore dresses of brocade

silk; and her hair was dressed in long corkscrew curls upon each side of her face. But before marriage, a multitude of faults are hidden, and Hugh Fluker considered her the only woman in the world that he could make his wife. Their courtship was always of the most formal character, and as they were sitting together she was saying: 'I vowed I would never marry, for, until I met you, Hugh, dear, I never saw a man whom I could trust.'

'And you trust me, Prudence?' he said.

'Yes,' she answered. 'It is because I trust you that I accepted your offer of marriage. But I wish to speak more seriously, more privately to you. You have told me that you possess no income beyond your pay, have you not?'

'That is true, alas!' he said.

'Well,' said she hesitatingly, 'my income is a good one; the expenses attending our marriage will be great, and therefore I want you to accept a small sum from me.'

He looked at her in astonishment, wondering what she could mean.

'Yes,' she continued; 'I am a woman of business, you know. Now, I want you to take Holly Lodge, furnish it properly, and have a wedding which cannot be sneered at all over the town. This, of course, cannot be done for nothing; so I have paid in one thousand pounds to a London bank in your name.'

'What!' he exclaimed. 'A thousand pounds for me?'

'Yes,' she replied, walking over to her davenport. 'Here's the pass-book and cheque-book. You can, if you like, for convenience, transfer the money to the Blankford Bank.' And she handed him the books.

'Well, really, Prudence, this is indeed very thoughtful of you,' replied the captain. 'I hardly like to accept the money, for'—

'But you must. I insist upon it. I want a costly and fashionable wedding, and I'll have it.'

'Why cannot I pay for it?'

'I will pay myself, because I do not wish to cripple your resources,' said she, smiling pleasantly as she added, 'of course you will not be offended?'

'No, no; not in the least, Prudence. It is awfully good of you, though, yet I suppose it will be all the same after we are married.'

Captain Hugh Fluker went to the bank on the following day, and negotiated the matter as Miss Prudence had suggested.

It is needless for us to dilate upon the manner in which his brother-officers greeted the news of his approaching marriage, how they chaffed him, or how good-humouredly he took it all. Of course the financial matter was a secret, though he told them he had taken Holly Lodge and was about to furnish it.

Preparations for the marriage were proceeding apace, and a month had already passed, when a very pretty young damsel arrived in Blankford and took up her duties as assistant to the local postmaster. Ethel Ellsworth was decidedly handsome; and within a week of her arrival, the golden youth, both military and civil, had lost their hearts to her. Never before was the post-office so well patronised, for during office hours the place was filled with the masher element,

who bought stamps and postal orders, sent telegrams, or required letters weighed, as an excuse for basking for a few seconds in the winning smiles of the siren behind the brass network. Chief amongst the worshippers at this shrine was young Bertie Oofington of the Slopshire, for he visited the post-office not less than a dozen times a day.

As may be imagined, this idolatry of a common post-office clerk caused the noses of many of the young ladies in the higher walks of life to be considerably elevated, as they waxed exceeding wrath that their attractions should be so totally eclipsed. At the officers' mess of the Slopshire she was the chief topic of conversation, and the subs one and all were exerting every effort to outdo each other in gaining her affection. Showers of presents in the form of fans, perfumes, flowers, and other trifles they poured in upon her, yet they could not fail to recognise the fact that she gave more encouragement to Oofington than to anybody else, and were very envious in consequence. They sorrowfully abandoned all hope of success, however, when it was made known that Bertie was her chosen admirer.

The Honourable Bertie Oofington, the pet of the Royal Slopshire, was the eldest son and heir of Lord Heaviswell, a rich old peer; and Blankford society was all agog when, within three weeks of her arrival, it was announced that he was actually engaged to be married to her. There was one man who remonstrated with him: it was Fluker.

'Look here, Bertie,' he said one evening as he was smoking with him in his quarters. 'The whole place is poking fun at you for flirting with that little girl at the post-office. What do you really mean to do?'

'Mean to do? Why, marry her, of course,' replied he.

'Well, my boy,' said Fluker gravely, 'I'm some years your senior, and my advice to you is, break the engagement before it goes too far.'

'I certainly shan't do that,' exclaimed the younger man; 'neither do I see any reason why you should interfere with my private affairs, even if you were my great-grandfather.'

'Forgive me. I advise you for the best.—What would his lordship say to such a *mésalliance*?'

'My father has nothing whatever to do with the matter. I love her, and by Jove, I'll marry her in spite of everything.'

'Very well,' replied Fluker, puffing vigorously at his cigar; 'but remember, I have given you my advice.' And the subject was allowed to drop.

The banns had been duly published between Hugh Fluker, bachelor, and Prudence Grimes, spinster, and no objection was made, although the parson requested all who might see any impediment to come forward and declare it.

One evening, Oofington went down to meet Ethel; but found, to his astonishment, that she had gone out half an hour earlier than usual. She had distinctly told him to meet her at eight o'clock, and yet she did not keep her appointment. Could she be playing him false, after all? The green-eyed monster rose within him, and he resolved to watch for her return. He had waited for nearly two hours in the shadow on the opposite side of the street, when he saw two

figures approaching. As they came nearer, he recognised his *fiancée* and Fluker! His first impulse was to rush across the road and confront them, but on a moment's reflection, he remained concealed. He saw Fluker speaking to her very earnestly, then he kissed her, shook hands, and she let herself in with a latchkey, whilst her companion strode away in the direction of the barracks. The Honourable Bertie muttered a curse, and soon overtook his rival. 'Now, Fluker,' stammered he, white with dismay and fury, 'what do you mean by daring to take Miss Ellworthy for a walk? I understand now why you were so anxious I should give her up. You wanted her yourself.'

The man addressed turned coolly round and said: 'I have advised you to have nothing more to do with her, and I fancy you'll find I'm right after all. But it's no use getting out of temper over it; so good-night.' And he walked away.

The young lieutenant, boiling over with indignation, turned on his heel, and muttering a savage threat, retraced his steps.

Next morning the gossips of Blankford had a titbit of scandal to relate, for Ethel Ellworthy had eloped with Captain Fluker. They had taken the early morning train to London.

When the news was broken to Miss Prudence, she had a fit of hysterics straight away; but she quickly recovered, and almost speechless with indignation, she cried: 'The monster! the swindler! He has robbed me of my heart, and swindled me out of my money. Oh, what a fool I was to part with that thousand pounds! But I'll bring an action for breach of promise, that I will.'

'Yes, to think that he should have lowered himself to run away with that minx only three days before his marriage,' said her sister. 'Long ago, I told you, Prudence, that these military men are all deceivers.'

'And well I know it,' moaned Miss Prudence. —'Oh, to think he should leave me in this manner.'

Later that day, she went down to the local bank in the hope of recovering some of the money she had given him, but found, to her dismay, that on the previous day it had all been drawn out. So she returned to Yew Cottage in a most unhappy frame of mind.

On the evening of the day previous to that fixed for the wedding, Hugh Fluker returned to Blankford alone, and at once sought his bride. He knocked, and was admitted to the drawing-room to await her.

In a few minutes she appeared. Her face wore an unutterable look of disgust, and she drew herself up to her full height as she said: 'Captain Fluker, I consider it the greatest presumption on your part to come here after your scandalous conduct.'

'Scandalous conduct!' he exclaimed in amazement. 'I'm at a loss to understand what you mean, my dear.'

'Don't address me in that manner, sir. Do you think I am not fully aware of your journey to London, and of your, your—companion?'

'Yes, that is true. I have been to London upon some business connected with our marriage; but as for my companion, I don't think you need have any cause to be jealous of her.'

'Indeed, and why not?'

'Well, merely because she is my sister,' replied the captain with a smile.

'Your sister!'

'Yes, my sister, by my mother's second husband. I did not tell you before, as I was not anxious that the fellows of ours should know that I had a sister in a post-office.'

'Oh, Hugh dear!' exclaimed Miss Prudence, 'I judged you harshly. Pray, forgive me; but I really thought you had eloped with her.'

'Well, there isn't much harm in taking one's sister up to town,' said Fluker; 'but the fact is, young Oofington is in love with her, and I'm trying to save him from making an ass of himself without his father's consent. I have seen his father Lord Heaviswell, and informed him of the facts. Ethel will be back to-morrow in time for our wedding.'

Blankford was never so puzzled as on the following morning, when the marriage took place at the parish church. There was a crowded assembly to witness the ceremony, and the arrangements were upon the most costly and fashionable scale.

Next day, Bertie Oofington received a letter from Scarborough, whither the happy couple had gone to spend their honeymoon, giving a full explanation, but asking that it might be kept secret. The young lieutenant laughed heartily, and vowed that 'the fossil' was a brick after all.

Upon their return to Blankford, Ethel took up her abode with them, and resigned her duties at the post-office. Six months afterwards, through the death of his lordship, the Honourable Bertie succeeded to the title and estates. He at once sent in his papers, and as soon as decorum would allow, made Ethel Lady Heaviswell.

But the good people of Blankford are still puzzled. They cannot make out what relation she is to Captain Fluker, though they feel certain there must be some family connection.

THE MONTH: SCIENCE AND ARTS.

RELICS of old London are getting scarcer and scarcer as the modern builder clears the ground for new houses. Roman London lies about fifteen feet below the present level of the City streets, and yields up occasionally a tribute of coins, tessellated pavement, or a few Roman ornaments. Antiquaries are just now much exercised about the preservation of a fine piece of Roman work which has recently been unearthed near the General Post Office, consisting of about one hundred feet of the veritable wall of London. As this discovery has been made on government property, it is to be hoped that arrangements will be made to preserve such an interesting memorial of olden times.

Professor Lintner, of New York, a well-known entomologist, has expressed the opinion that if fruit-growers wish to be successful they should study the habits of insects and the nature of their food, so that they may be competent to tell friends from foes, and may be able to use insecticides to the best advantage. The Professor affirms that there are in the world three hundred and twenty

thousand species of insects, and that from seven to eight thousand may be considered as fruit-pests.

Mr William A. Gibbs, of Chingford, Essex, whose hay-drying and tea-drying machines were noticed by us some years ago at the time of their invention, has recently constructed a machine by which pure hot air is derived direct from the combustion of coal. The operation is brought about partly by chemical agency and partly by mechanical appliances, and is said to be so effectual that all trace of smoke disappears, and the products of combustion, instead of consisting of irrespirable gases, take the form of hot air which can be inhaled without danger or inconvenience. We have not at present any details of the construction of the machine; but if it prove as successful as it is stated to be, its application to the arts and to domestic use will cause a revolution in the present methods of burning fuel, and should settle the smoke-abatement question.

Woodhall Spa, in Lincolnshire, contains a mineral spring which is unusually rich in bromine and iodine, resembling in its composition the waters of the celebrated *Bad* at Kreuznach. This spa has been acquired by a syndicate, who hope to induce their countrymen to avail themselves of the benefits it affords, instead of seeking the same remedy in Germany. The baths are fitted with the orthodox 'Pump-room,' and every convenience for patients and visitors.

A writer in the *Century* magazine recently gave some curious statistics referring to the chances of being hit by bullet or shell in modern warfare. He quotes an old saying to the effect that 'it takes a man's weight in lead to kill him,' and he shows by the returns from more than one battle-field that the axiom is literally true. As a case in point, he alludes to the battle of Stone's River, one of the greatest during the American War. In the official Report of this battle it is stated that the artillery fired 20,307 rounds of ammunition, representing a weight of 225,000 pounds. The infantry fired two million rounds, being a weight of lead which exceeded 150,000 pounds. These two weights combined are fully equal to the weight of the men killed or mortally wounded—who numbered 2319. Another calculation with regard to this battle takes note of the wounded, and is given in another form. Here it is stated that 20,000 rounds of artillery hit 728 men, and that the two million infantry rounds hit 13,832 men; averaging 27.4 cannon-shots to hit one man, and 145 musket-shots to hit one man. The old adage which states that 'every bullet has its billet' would seem, therefore, to require some qualification. It is at anyrate a comfort to consider that the modern soldier has so many chances against being shot, for, according to these figures, for every bullet which finds its billet, exactly one gross go astray.

Mr Pritchard Morgan, the proprietor of the gold mine at Dolgelly, has at length so far satisfied the claims of the government that work has been resumed. The quartz still produces a high average of gold per ton, and Mr Morgan is strongly of belief that there is untold wealth in the district. He states that the gold-field extends over a range of country from sixty to one hundred miles in length, by forty miles in breadth. It is said, however, that this mine is likely to be eclipsed in importance by another one which

has just been discovered at Festiniog. This discovery was made by accident, some men being engaged in quarrying, when they came upon some quartz sprinkled with brilliant specks of metal. Specimens of the ore were forwarded to Mr Lowe, the public analyst of Chester, who immediately detected the metal to be gold. Later on, Mr Lowe was invited to visit the place and to make a general survey of it. His geological knowledge quickly enabled him to direct the miners to open the reef at a certain point, and they soon unearthed some very fine specimens of gold quartz. On analysis, the ore yields the large amount of five ounces of gold to the ton.

It has long been known that fish, like birds and insects, are attracted by and will swarm round any source of illumination. Birds are killed in thousands by flying against the thick glass which protects lighthouse lanterns, and various insects are caught with the help of a light. The difficulty of maintaining a subaqueous light has hitherto prevented the application of the same principle to fishing. But now that we have at command an electric illuminant which is quite independent of oxygen, and which will therefore give light in a closed chamber, the difficulty is at an end. With lamps arranged for the purpose, the United States steamship *Albatross* has been catching multitudes of the finny tribes, the lamps being enclosed in wire-netting to obviate risks of breakage. It is curious to note that if this method of fishing is found to be advantageous enough to become common, it will have a distinct bearing upon the disputes which have arisen between the American and Canadian fisher-folk, for the former will have no longer any need of troubling the latter for bait.

It is to be hoped that the recent agitation with regard to England's weakness from a military point of view will not have the effect of unduly hurrying on the adoption of the new Magazine rifle, for, according to the recent Report of General Wasmund, of the Russian army, who has been making a continental tour for the purpose of studying the magazine guns used by various powers, the new arm possesses certain disadvantages which might not at first be apparent. The soldier, he says, regards the many cartridges in his gun as so much reserve power, and is therefore apt to neglect those precautions which he would naturally take when his piece must be reloaded after each discharge. He found, too, that after a long march those men who were armed with the old-fashioned rifle made far better target practice than those who carried the new weapon. One reason for this would be that in the case of the first, the weight and poise are constant, whereas in the latter they must vary as the contents of the magazine are discharged.

There is a touch of romance in a true story recently published concerning the discovery of a sunken rock in the Red Sea. During the year 1887, two ships struck on a submerged rock in these historic waters, and soon afterwards foundered. A search was at once made for the dangerous obstruction, but without success. A second and more careful search was then made, again unsuccessfully. At last a surveying vessel was sent out for a six weeks' cruise for the sole purpose of finding this hidden rock; but the search was fruitless. But a fourth expedition by H.M.S.

Stork has been at last successful, and the rock has been found. It consists of a patch of coral only fifteen feet beneath the surface of the water; and although it is out of the direct line of vessels traversing the sea, it would be quite possible for them, by strong currents, to be carried in the direction of the obstacle. Bearing in view the enormous tonnage that navigates this sea in modern times, the discovery is a very important one.

All visitors to country districts know full well that in some places farmyards are kept in the most filthy condition, the animals therein often being left to drink from some pond which by its colour and smell at once proclaims its foul condition. It would seem impossible that the milk from cows so badly provided for should constitute healthy food, and according to certain experiments recently made by Professor Law at Cornell University, such milk is contaminated with living organisms to an alarming extent. This gentleman caused some cows to drink for several days from one of these stagnant pools, and when he afterwards examined the milk from them, microscopically, he found it full of living organisms of an identical character to those contained in the pond. The cows were then examined, and found to be in a feverish condition, their blood being charged with the same minute creatures. Some pure milk was then mixed with some of the pond-water, when it was found that they multiplied to a surprising extent in the liquid. The lesson to be obtained from these experiments is obvious.

It is well known that a large proportion of colliery explosions are either directly due to or are much aggravated in intensity by the presence of suspended coal-dust in the air of the workings. To avoid this danger, Messrs Martin & Turnbull, of Dowlais, Glamorgan, have invented a method by which the air in mines can be kept constantly damp. Water is forced by compressed air into spray, both agents being carried by pipes to any part of the mines where danger is supposed to lurk. This fine spray is quickly diffused by the air-currents in the workings, and effectually damps the dust with which it comes into contact.

Whilst the use of alcoholic beverages of all kinds is rigidly condemned by a certain section of the community, 'the cup that cheers but not inebriates' is often charged with various ill doings. The last indictment brought against the pleasant cup of tea is that of destroying the teeth. Surgeon W. T. Black, writing to the *British Medical Journal*, informs us that when on duty at certain recruiting stations in the north of England he made observations on the great amount of disease and loss of teeth existing among the men who offered themselves for service. In a great many instances individuals were rejected on the score of the state of their teeth; and he was led to trace this disease to the excessive tea-drinking commonly indulged in by the working classes in the manufacturing towns. He asserts that tea seems to have a peculiar effect upon the teeth, leading to inflammation, and eventually abscess of the fang. It would be useful to know whether these observations can be corroborated by other medical men.

According to the *Electrician*, a magnetic crane is employed at some steel-works at Cleveland, Ohio, for lifting steel ingots and heavy masses of iron. The magnet is of the electric form,

consisting of two rods of soft iron covered with insulated coils of wire, and receiving a current from a battery or dynamo-machine. It will lift a weight of eight hundred pounds without difficulty.

M. Bone has brought forward a plan for dealing with the rabbit pest in Australia, which he believes would be found more economical than the methods suggested by M. Pasteur, and better in every way than the present methods of extermination adopted by the Australian government. He suggests that a poisonous gas should be introduced into the burrows of the animals; and he names carbonic oxide, the vapour of carbonic disulphide, and carbonic acid gas as those which would be cheap and effectual. The apparatus for the ready generation of these gases is not described; and upon that part of the scheme would we should think depend its practicability.

This rabbit pest in Australia seems to have its counterpart in a plague of rats in China, which latter forms the subject of a memorial to the Emperor which is published in the *Pekin Gazette*. This memorial comes from the governor of a district in outer Mongolia, who testifies to the presence of swarms of rats, which for some two years past have destroyed all the grass in the land, and have so undermined the ground with their burrows that mounted men are exposed to serious risks. For this reason it has become necessary to alter the routes of the government courier service in several of the postal lines. The old story of Dick Whittington and his cat seems more worthy of credence after reading this account.

A new and terrible era in the science of warfare is foreshadowed by a torpedo shell, which has lately been manufactured at Waterbury, Connecticut, for the dynamite gun invented by Captain Zalinski. This shell is made of seamless three-sixteenth-inch brass, and has been drawn out cold by means of hydraulic pressure. It represents a cylinder nearly seven feet long, with a conical end, with an inside diameter of fourteen inches, and it weighs two hundred pounds. This metal case is destined for the reception of six hundred pounds of explosive gelatine. The complete projectile will form an explosive mass of awful power, and one which no ship afloat or fortification on shore could possibly withstand.

The great engineering feat of moving a large hotel bodily by means of haulage, to which we recently devoted a brief notice, has now been successfully accomplished at Coney Island, New York. The building was first raised in sections by means of hydraulic jacks, and was placed on cars, wheeled on rails, under it. The distance traversed was nearly five hundred feet; and the weight of the building, a wooden structure, together with the trucks or cars on which it was placed, was estimated to amount to six thousand tons. The whole operation was carried through without accident or hitch of any kind. Its success will certainly turn renewed attention to the feasibility of Captain Eads' scheme of a ship railway, which was thought at one time to be a formidable rival to the Panama Canal. It is now argued, and with reason, that if a large house can be safely moved by such means, a ship, built to resist strains of every kind, could be far more easily dealt with.

The *Indian Daily News*, which is published in Calcutta, tells of the successful treatment of a case of snake-bite. Dr Vincent Richards was engaged in a number of experiments with some cobras; and while he was holding one of the reptiles with the object of procuring some of its poison in a watch-glass, the snake bit him severely in the left hand. The doctor immediately killed the snake, laid the wound in his finger open to the bone, and applied to it permanganate of potash, at the same time applying a ligature to the finger, and another below the elbow. He then sought medical help. His confrères reopened the wound; and after cauterising with nitric acid, it was dressed in the ordinary manner. Dr Richards gradually recovered from the accident, and is reported to feel no ill effects from it.

Owing chiefly to the enterprise of several traders, the fiftieth year of Queen Victoria's reign is likely to be well impressed on our memories, the word Jubilee having been attached to goods of the most opposite descriptions. Mr Ashton Smith is determined that the event shall be recorded in a very prominent way. He has caused to be planted on the side of a mountain in Wales, Moel Rhimen by name, a plantation of nearly seven thousand trees, which will be so arranged as to represent the words 'Jubilee, 1887.' The letters each measure two hundred yards long, by twenty-five feet wide; and two hundred men, it is said, have found constant employment in planting the trees since Jubilee day, when the work was commenced.

There is nothing new under the sun, not even type-writers. It has just been discovered that as early as the year 1829 the type-writing machine, under the name of Typographer, was invented, drawings and specifications of which were deposited at the United States' Patent Office at that date. It is said that these drawings closely resemble the machines now in use.

According to the *Lancet*, in certain districts in the north of Ireland ether is largely used as an intoxicant. A special kind of ether is prepared for drinking purposes, and its success in supplanting whisky appears to be owing to its cheapness; for a person can obtain for a penny sufficient of the potent fluid to intoxicate him. It may be here mentioned that the so-called chloric ether, which, under its newer name of spirits of chloroform, is prescribed to give a pleasant flavour to nauseous draughts, has often been used as a stimulant by inebriates who have had access to it. It is not ether, but consists of a solution of chloroform diluted in nineteen parts of rectified spirit. With regard to the ether sold for drinking purposes, it is asserted that the Excise authorities have been applied to, but that they have no power to control its sale.

A widespread belief has arisen within the last few months to the effect that modern stained glass windows do not possess that permanence which distinguishes those of medieval date. Mr Phillip Newman recently read an interesting paper before the members of the Society for the Encouragement of Fine Arts upon this subject. In this paper he fully describes the process of glass-staining, and dwells upon the destructive effect which the bad air of ill-ventilated churches will often have upon stained windows. He believes that the colours produced by modern workers are

quite as good as those of older times, while at the same time they present a far greater variety of tint. In certain cases, the colours have undoubtedly faded, but only where the glass has been painted with colours containing soft fluxes. Where the glass has been carefully fired and proper silicated flux has been used, the pigments will defy time and the destructive effects of bad air.

THE NEW EXPLOSIVE:

CARBO-DYNAMITE.

To the already long list of so-called high explosives—of which there are about thirty—used in industrial pursuits or for war purposes, another very powerful explosive agent has just been added. As its name, carbo-dynamite, implies, carbon forms part of its constitution. It should be stated that in ordinary dynamite seventy-five per cent. of nitro-glycerine is absorbed by twenty-five per cent. of Kieselguhr, an earthy mineral specially suitable for the manufacture of dynamite on account of its absorbent property; but Kieselguhr has this disadvantage, that it is incombustible. In carbo-dynamite, ninety parts by weight of nitro-glycerine are taken up by ten parts of a specially prepared carbon of a very porous nature. As carbon is combustible, it adds to the explosive effect of the whole mass; and in this respect, it will be seen, carbo-dynamite is superior to ordinary dynamite.

But it possesses other advantages, which were demonstrated at recent trials carried out at Treherbert, Rhondda Valley, South Wales. In the first experiment, an eighty-pound double-headed steel rail, placed on its side, was smashed through by an ounce and a half of carbo-dynamite, about nine inches of the rail being blown clean away. In the next, a large boulder of hard sandstone, weighing about two tons, was broken up by a two-ounce charge of carbo-dynamite. Equal charges of a quarter-ounce of carbo-dynamite and ordinary dynamite were also exploded inside two thick lead cylinders of a capacity of four and three-fourth cubic inches, with the result that this capacity was expanded to nearly thirty-six cubic inches with carbo-dynamite, but to only twenty-one inches with ordinary dynamite. Similar charges of the two explosives were then placed inside two thick steel tubes each one foot long. The ordinary dynamite burst its tube well; but the carbo-dynamite charge did its work much better, bending the tube as well as bursting it, and sending it flying some fifteen yards from the point of explosion. The last experiment in the open consisted in placing one ounce each of carbo-dynamite and ordinary dynamite on flat steel discs, three inches in diameter and five-sixteenths of an inch thick, and supported on rings or collars. After the explosion, it was found that the ordinary dynamite had indented its disc a quarter of an inch; while the carbo-dynamite had caused a concavity seven-sixteenths of an inch deep, or three-sixteenths of an inch deeper than the other, besides driving its supporting ring deeply into the ground.

In order to show that, in using carbo-dynamite in underground work, no noxious fumes arise, an experiment was made in a tunnel, half a mile

long, constructing for the Rhondda and Swansea Bay Railway. When a shot had been fired in the rock at the heading of the tunnel with one pound of carbo-dynamite, no deleterious fumes could be detected. When, however, subsequently, a shot was fired with one pound of ordinary dynamite, noxious vapours were plainly discernible. Carbo-dynamite, consequently, will enable miners to pursue their arduous work without injury to health, and the advantage claimed for it, that no injurious fumes are generated in its explosion, seems to be well established. As carbo-dynamite is not affected by moisture, not exuding or parting with its nitro-glycerine when exposed to damp or water, it may safely be mixed with that liquid in any required proportion, and, thus treated, used in fiery mines, the large volume of steam generated at the moment of explosion not only extinguishing any flame which might have been produced, but also adding considerably to the effect of the shot. It is further stated that the manufacture of carbo-dynamite is simple and inexpensive, and that its cost to the user will not exceed that of ordinary dynamite. These latter points remain, of course, to be proved; but from what has been said of its use and effect, there can be no doubt that a very formidable rival has arisen to ordinary dynamite, and that the introduction of carbo-dynamite in mining or tunnelling work is only a question of time.

A SEA IDYLL.

Last night I saw the mermaids ride

On shore-bounded waves with music wild,
And watched them where, against the cliffs,
Their bowers of snowy foam they piled.

All night they worked; but when the dawn
Came blushing rosy o'er the deep,
The sea, grown weary of the toil,
Recalled his waves, and sank to sleep.

The mermaids wept, and combed their hair,
Melted were all their foam-wreathed bowers,
Till one sweet mermaid sang, 'Let's make
New harbours of the white sea-flowers.'

'Yes, yes,' they cried; and hand in hand,
Sank through the blue depths joyously;
And now, I ween, they're gathering flowers
In the bright gardens of the sea.

ALICE STAPLES CARTER.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them* IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

MORNING IN THE WOODS.

IN some respects the early dawn of one summer morning is much like another; and save now and then when Jupiter Pluvius is in a watery temper, the charm and beauty and fragrance of early morning in the country are unvaried. It may be the opening of a day of soft gray cloud, or of splendid unbroken sunshine; but the first coming of the light is always a mystery of gracious and tender peace to all who have eyes and ears to discover and enjoy it.

See, the day begins to break,
And the light shoots like a streak
Of subtle fire; the wind blows cold,
As the morning doth unfold.
Now the birds begin to rouse,
And the squirrel from the boughs
Leaps, to get him nuts and fruit;
The early lark, that erst was mute,
Hails the dawning of the day
With many a trill and many a lay.

So sings an old and almost forgotten English poet, in a dainty little stanza as true to life as it is full of poetic and sparkling grace.

It is barely five o'clock on a fine August morning; come with me for half an hour, and ramble down this hillside, and see how true to life is the poet's picture. Once clear of the garden, we are out in the open road, great and busy enough in the old coaching days, but lonely now as a track through a New Zealand clearing. Far away on the dim horizon under that veil of silver mist is the cathedral city. Away to the left stretches mile after mile of rich green pasture and waving yellow corn; while all down the slope to the right runs a full league of tangled and shady woodland, into the hundred grassy roads of which it is easy enough to find a pleasant entrance, and often just as difficult to find your way out. Along the edge of the wood is a field of sainfoin still glowing here and there, after the sickle, with patches of crimson blossom. As we follow the winding path to the brow of the hill, we get the first taste of the keen crisp air, like a draught of

sparkling vintage. The dew lies thickly on the long rough grass and on the nut-bushes along the edge of the wood; and wavy streamers of shining gossamer are floating here and there in the soft sunshine, as if in search of a resting-place. All is very still as yet, the only sound being a faint whispering murmur from the clump of Scotch firs by the roadside, and the first joyous song of the lark which has just started up from her nest among the streaming grass. Watch her as she mounts up towards the sky, 'and ever singing wins her liquid way,' higher and higher still, by a series of rapid and irregular short ascents, until she dwindles to a mere speck, or is lost to sight. Presently, the whole air will be full of sweet sounds, as scattered over the wide fields other happy singers speed their flight to join in the happy chorus.

Meanwhile, here close at hand the partridge is calling to her young with a soft low whistle; blackbirds and thrushes are darting in and out of the thick hedgerow, now and then uttering a short quick cry of alarm; or, after a few notes of broken song, suddenly dashing down to the ground to seize on the hapless worm—which pays dearly for not going home till morning—and hurry back to their favourite bough. All at once, up start the whole covey of partridges with a loud whirring noise, not thoroughly frightened, but only to settle down again among some tangled grass and bramble a hundred yards away. There are fourteen of them altogether; most likely from the very nest which the keeper showed me a month or two ago just inside the fence of the next meadow; and a curious nest it was, in a snug corner under the shelter of the hedge. 'There!' said the keeper. 'Not much like a nest, is it?' I looked, and saw nothing but a roundish heap of tangled dry grass and leaves. This, however, he carefully lifted up, and underneath showed me a slight hollow scratched away in the earth, with a dozen or more of goodly eggs, snugly covered with grass. Both the old birds were away feeding, leaving their nursery for a short time so cleverly concealed that you might pass it a score of times without a

suspicion of what lay hidden under the pile of withered grass.

But now, we are on the very brow of the hill, and get a glimpse of the whole horizon. Far off to the south, above the faint blue distance, runs a broad band of amber light; above it, a long smooth layer of dark gray cloud; and above that a longer, keen shaft of delicate sea-green, which runs away into the extreme east, and is lost in a blaze of lemon, orange, and gold, amid a pile of dusky clouds, through which splinters of rosy light are stealing up over the broad expanse. In a few moments the sun himself will be fairly up, and hill and valley, mead, woodland, and stream will be crowned with touches of fiery splendour to welcome the golden dawn.

Turn aside by this winding path, and in two minutes we shall be in the deep shade of a grass road through the heart of the wood; with a thick growth of hazel, ash, spindle, and bramble on both sides of us, and here and there arching overhead. Here and there, too, among the thick underwood towers up a gnarled and twisted oak; or a still nobler beech, round which a goodly space has been cleared; for my lord, though mindful of pheasants, has an eye to solid timber, and in the next mile you may count a hundred forest trees of royal dimensions. After the fresh breeze of the hillside, the air seems cold and damp; and the moss under your feet is so thick that not a footstep can be heard. Tiny shafts of sunlight are stealing in here and there among the green leaves; a robin is in full song on the topmost bough of a copper beech; swarms of small birds, finches, tits, and fly-catchers, are all awake, and busily in search of breakfast. Far away, there is a faint sound of lowing kine, and the still fainter claron of chanticler, just let loose with his clucking wives into the lonely farmyard. Every now and then we stumble over the furrow of fresh brown earth, where Master Mole has been busy hours ago; and still oftener the burrow of a rabbit, outside the entrance of which Madam Bunny has carelessly left tufts of downy fur, of which some villainous stoat will not be slow to take advantage. And here, all at once in the green pathway we come upon a strange and unexpected find in the shape of a nut-brown Squirrel's Tail tipped with white. How, whence, and why it is there is a puzzle; but there it is, as you may see and feel for yourself. Our woods fairly swarm with these nimble mischievous imps, and I have often seen four or five of them at high-jinks round a single beech-tree, racing up the trunk, or flying from branch to branch with a mad haste and daring fun that must be seen to be credited.

But our green road suddenly ends in the open woodland, where half-a-dozen pathways branch away in every direction, and you may wander for an hour before you find your way home. The sun is fully out by this time, and the swallows are skimming swiftly across and across among clouds of flies, and specially round the old barn, on the door of which the keeper has nailed up a perfect host of what he calls 'varment': sparrow-hawks, weasels, crows, jays, magpies, and, alas and alack,

a splendid brown owl* with outspread wings—in *terrorem* for all poaching marauders that crawl, creep, and fly. And as good luck will have it, here comes the keeper himself, with brown leather gaiters half-way up his legs, a gun over his shoulder, and a grim sort of a smile on his ruddy sunburnt face as he sees us gazing at his museum.

'We were looking,' said I, 'at poor old Tu-whit, Tu-whoo! and wondering how he came to get here among the robbers.'

'He?' replies Gaiters. 'Why, he's as big a rogue as any one of 'em. Just you look now at his beak! Tell me that there bill weren't a-made to tear a bird's breast to bits? See!—all crooked, and sharp as a knife, just like an eagle he be. It stands to reason as he must be up to mischief. Reg'lar varment, I say, sir.'

After such a terrible indictment as this, it was useless to say a word in the prisoner's defence; but, as for 'standing to reason,' that was just where the sentence would not stand. If his name had been Corvus, the crow, the verdict would have been unanimous; it would be hard to find a craftier or greedier assassin. Nothing alive comes amiss to him—from the tiny callow fledgling that has tumbled out of the thrush's nest, to a partridge, or a dainty young rabbit, a young pheasant straying from the coop, or a chicken in a lonely farmyard, down to a tiny mouse in the furrow—no small creature is safe against that terrible pointed beak.

'You've been down through Blackwood, I see, gentlemen,' says the keeper. 'I know'd that squirl's tail in a jiffy. As I come home last night, sir, me and my boy, I knocked that squirl over up under the beech-tree; and when Sam went to pick him up, what does he do but nip his finger right into the bone! The boy lets go; and then, when he catches him by the tail, blest if it didn't come right off! and away goes Jack up the tree like a shot. But I shall mark him yet, some day, the nasty varment!'

'Poor wretch,' said I; 'he's marked enough already; and must be counted a regular Guy among his friends and relations—without a tail, and his jacket riddled with small-shot.'

But we must say good-morning to Mr Gaiters, and stroll slowly back through the grass road, which by this time is fairly checkered with patches of bright sun and shade. There are not many flowers in this dainty nook; but bees are out and busy among the wild thyme, which somehow or other has found its way in from the hedge; and still busier among the snowy blossom of the bramble, and the wild raspberry, which grows here in abundance. It is but six o'clock as we get back to the old dry sandy coach-road and stroll into the kitchen garden. Here, again, as you see, the whole place is alive with birds, among which, in spite of my love for them, I am bound to say there are many thieves, and chief among them all the impudent blackbird with his glossy coat and yellow beak. As a good rough wild songster, he is pleasant enough at early dawn, or at gray twilight in the hedgerow.

* Nothing will convince a keeper that poor old *Strix flammea* (the Barn Owl) is not a deadly foe to all game. Tell him that the owl lives almost entirely on mice—which eat the crops—that he kills mice and beetles by the hundred; his one answer is 'varment.'

But as a plunderer of gooseberries, currants, and cherries, his greediness is without bound, even when other food is abundant. In a single July morning a whole row of gooseberry bushes and our only cherry-tree (*Morellas*, too) were stripped bare by a couple of these sable rogues, in spite of all that could be done to warn them off. In a similar fashion, two noble mountain-ash trees in front of the house were stripped bare of their crimson glory in a few hours. The thrush is bad enough; but, hearken for one moment, and you will hear her in the very next pathway, beyond the raspberry bed. There is a favourite flint-stone there, half-buried in the gravel, to which she always comes at this time, after hunting for snails among the cabbages. The smaller ones she swallows whole, shells and all; the big ones she brings up to this stone, against which she nimbly dashes them, and soon makes a hearty breakfast, as a pile of broken shells clearly proves.

Of the blackbird one must say: 'Hic niger est, hunc tu Romane caveto.' Keep him out of your fruit-garden—if you can; and it is not easy. But let your thrushes sing on in joyful peace. Their song is worth many a score of raspberries. Net all your fruit-trees; and don't grumble if a few choice bunches now and then disappear in spite of all nettings and of all gardeners' boys employed as scarecrows—perhaps because of these latter plagues. Never make war on the finches—chaf, green, or gold; nor against the merry tit-mouse big or little. Against every dozen morsels of ripe fruit or green young shoots which they carry off, must be set millions of the garden and flower-beds' worst plagues—slugs, worms, caterpillars, insects, grubs, and the eggs of a myriad of other pests, which, however lovely under the lens of a microscope, are simply detestable anywhere else but in a bird's mouth.

Whether the owner of a country garden shoots sparrows or not, seems to be a matter of little consequence; they increase and multiply at such a prolific rate, that, whether destroyed wholesale or simply let alone, their number seems unchanged.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XXX.—THE BARD IN HARNESS.

'I NEVER felt more astonished in my life,' Hatherley remarked one day some weeks later to a chosen circle at the Cheyne Row Club, 'than I felt on the very first morning of my visit to Whitestrand. Talk about being driven by a lady, indeed! Why, that frail little woman's got the Bard in harness, as right and as tight as if he were a respectable cheesemonger. It's too surprising. The Bard's done for. His life is finished. There the Man stops. The Husband and Father may drag out a wretched domestic existence yet for another twenty years. But the Man is dead, hopelessly dead. Julius Cæsar himself's not more utterly defunct. That girl has extinguished him.'

'Are there any children, then?' one of the chosen circle put in casually.

'Children! No. There was a child born just after old Mrs Meysey's death, I believe; but it died, and left the mother a poor wreck, her own miserable faded photograph. She was a nice little girl enough, in her small way, when she was here in town; amusing and sprightly; but the Bard has done for her, as she's done for the Bard. The fact is, this is a case of incompatibility of disposition. You can't stop three days at Whitestrand without feeling there's a skeleton in the house somewhere!'

The skeleton in the house, long carefully confined to its native cupboard, had indeed begun to perambulate the Hall in open daylight during the brief period of Hatherley's visit. He reached the newly remodelled home just in time to dress for dinner. When he descended to the ill-lighted drawing-room, five minutes late—Whitestrand could boast no native gas-supply, and candles are expensive—he gave his arm with a sense of solemn obligation to poor dark-clad Winifred. Mrs Massinger was indeed altered—sadly altered. Three painful losses in quick succession had told upon that slender pale young wife. She showed her paleness in her deep black dress: colours suited Winifred: in mourning, she was hardly even pretty. The little 'arrangement in pink and white' had faded almost into white alone: the pinkness had proved a fleeting pigment: she was not warranted fast colours. But Hatherley did his best with innate gallantry not to notice the change. Fresh from town, crammed with the last good things of the Cheyne Row and Mrs Bouverie Barton's Wednesday evenings, he tried hard with conscientious efforts to keep the conversation from flagging visibly. At first he succeeded with creditable skill; and Hugh, looking across at his wife with a curious smile, said in a tone of genuine pleasure: 'How delightful it is, after all, Winnie, to get a hold of somebody, direct from the real live world of London, in the midst of our fossilised antediluvian Whitestrand society!—I declare, Hatherley, it does one's heart good, like champagne, to listen to you. A breath of Bohemia blows across Suffolk the moment you arrive. Poor drowsy, somnolent, petrified Suffolk! "Silly Suffolk," even the aborigines themselves call it. It's catching, too. I'm almost beginning to fall asleep myself, by force of example.'

At the words, Winifred fired up in defence of her native county. 'I'm sure, Hugh,' she said with some asperity, 'I don't know why you're always trying to run down Suffolk! If you didn't like us, you should have avoided the shire; you should have carried your respected presence elsewhere. Suffolk never invited you to honour it with your suffrages. You came and settled here of your own free will. And who could be nicer or more cultivated, if it comes to that, than some of our Suffolk aborigines, as you call them? Dear old Mrs Walpole at the vicarage, for example.'

Hugh balanced an olive on the end of his fork. 'An amiable old Hecuba,' he answered provokingly. 'What's Hecuba to me, or I to Hecuba? Her latest dates are about the period of the siege of Troy, or, to be more precisely accurate, the year 1850.—My dear Hatherley, when you come down, I feel like a man who has breathed fresh air on some high mountain—'

stimulated and invigorated. You palpitate with actuality. Down here, we stagnate in the seventeenth century.'

Winifred bit her lip with vexation, but said nothing. It was evident the subject was an unpleasant one to her. But *she* at least would not trot out the skeleton.

Next morning Hugh showed Hatherley round the Whitestrand estate. Hatherley himself was not, to say the truth, in the best of humours. Mrs Massinger was dull and not what she used to be: she obviously resented his bright London gossip, as throwing into stronger and clearer relief the innate stupidity of her ancestral Suffolk. The breakfast was bad; the coffee sloppy; and the dishes suggested too obvious reminiscences of the joints and entrées at last night's dinner. Clearly, the Massingers were struggling hard to keep up appearances on an insufficient income. They were stretching their means much too thin. The Morris drawing-room was all very well in its way, of course; but tulip-pattern curtains and De Morgan pottery don't quite make up for a *réchauffé* of kidneys. Hatherley was an epicure, like most club-bred men, and his converse for the day took a colour from the breakfast table for good or for evil. So he started out that morning in a dormant ill-humour, prepared to tease and 'draw' Massinger, who had had the bad taste to desert Bohemia for dull respectability and ill-paid Squiredom in the wilds of Suffolk.

Hugh showed him first the region of the sandhills. The sandhills were a decent bit to begin with. 'Æolian sands!' Hatherley murmured contemplatively as Hugh mentioned the name. 'How very pretty! How very poetical! You can hardly regret it yourself, Massinger, this overwhelming of your salt marshes by the shifting sands, when you reflect at leisure it was really done by anything with so sweet an epithet as Æolian.'

'I thought so once,' Hugh answered dryly, with obvious distaste, 'when it was the property of my late respected father-in-law. But circumstances alter cases, you know, as somebody once remarked with luminous platitude; and since I came into the estate myself, to tell you the truth, I can't forgive the beastly sands, even though they happen to be called Æolian.'

They walked along in silence for a while, each absorbed in his own thoughts—Hatherley ruminating upon this melancholy spectacle of a degenerate son of dear old Cheyne Row gone wrong for ever: Massinger reflecting in his own mind upon the closer insight into the facts of life which property, with its cares and responsibilities, gives one—when he suddenly halted with a short sharp whistle at a turn of the path. 'Whew!' he cried; 'why, what the dickens is this? The poplar's disappeared—at least, its place, I mean.'

'Ah, yes! Mrs Massinger told me all about that unlucky poplar when you were gone last night,' Hatherley answered cheerfully. 'The only good object in the view, she said—and I can easily believe her, to judge by the remainder. It got struck by lightning one stormy night, and disappeared then and there entirely!'

'This is strange—very strange!' Hugh went on to himself, never heeding the babbling interruption. 'The sand's clearly collected on this side of late. There's a distinct hummock here, like

the ones at Grimes's.—I wonder what on earth these waves and mounds of sand can mean?—The wind's not going to attack this side of the river, too, is it?'

'Ah, Squire,' a man at work in the field put in, coming up to join them, and leaning upon his pitchfork—'ah 'm glad yo've come to see it yourself, naow. That's jest what it be. The sand's a-driftin'. Ah said to Tom, the night the thunderbolt took th' owd poplar—ah said: "Tom," says ah, "that there poplar were the only bar as stopped the river an' the sand from shifting. It's shifted all along till it's reached the poplar; an' naow it'll shift an' shift an' shift till it gets to Lowestoft or mayhap to Norwich."—An' if yo'll look, Squire, yo'll see for yourself—the river's acshally runnin' zackly where the tree had used to stand; an' the sand's a-driftin' an' a-driftin', same as it allays drift down yonner at Grimes's. An' it's my belief it'll never stop till it's swallowed up the Hall and the whole o' Whitestrand.'

Hugh Massinger gazed in silence at the spot where the Whitestrand poplar had once stood with an utter feeling of sinking helplessness taking possession at once of his heart and bosom. A single glance told him beyond doubt the man was right. The poplar had stood as the one frail barrier to the winds and waves of the German Ocean. He had burnt it down, by wile and guile, of deliberate intent, that night of the thunderstorm, to get rid of the single mute witness to Elsie's suicide. And now, his Nemesis had worked itself out. The sea was advancing, inch by inch, with irresistible march, against doomed Whitestrand.

Inch by inch! Nay, yard by yard. Gazing across to the opposite bank, and roughly measuring the distance with his eye, Hugh saw the river had been diverted northward many feet since he last visited the site of the poplar. He always avoided that hateful spot: the very interval that had elapsed since his last visit enabled him all the better to gauge at sight the distance the river had advanced meanwhile in its silent invasion.

'I must get an engineer to come down and see to this,' he said shortly. 'We must put up a breakwater ourselves, I suppose, since a supine administration refuses to help us.—I wonder who's the proper man to go to for breakwaters? I'd wire to town to-night, if I knew whom to wire to, and check the thing before it runs any farther.'

'What's that Swinburne says?' Hatherley asked musingly. 'I forget the exact run of the particular lines, but they occur somewhere in the *Hymn to Proserpine*:

Will ye bridle the deep sea with reins? will ye chasten
the high sea with rods?
Will ye take her to chain her with chains who is
older than all, ye gods?

I don't expect, my dear boy, your engineer will do much for you. Man's but a pigmy before these natural powers. A breakwater's helpless against the ceaseless dashing of the eternal sea.'

Hugh Massinger almost lost his temper—especially when he reflected with bitter self-abasement that those were the very lines he had quoted to Elsie—in his foolish pre-territorial days—about Mr Meysey's sensible proposals for obtaining an

injunction against the German Ocean. 'Eternal sea! Eternal fiddlesticks!' he answered testily. 'It's all very well for you to talk; but it's a matter of life and death to me.—We've got to build a breakwater, that's what it comes to. And a breakwater'll run into a pot of money.'

'Pity the old tree ever got burnt down, anyhow, to begin with,' Hatherley murmured low, endeavouring, now he had fairly drawn his man, to assume a sympathetic expression of countenance.

They walked back slowly to the Hall in silence, passing through the village out of pure habit. Hugh was evidently very much put out. Hatherley considered him even rude and bearish. A man should restrain himself before the faces of his guests. At the door, Hatherley strolled off round the garden walks and lit a cigar. Hugh went up to his own dressing-room.

The rest Hatherley never knew; he only knew that at dinner that night Mrs Massinger's eyes were red and sore with crying. For when Hugh reached his own room—that pretty little dressing-room with the pomegranate wall-paper and the pale blue Lahore hangings—he found Winifred fiddling at his private desk, a new tall black-walnut desk with endless drawers and niches and pigeon-holes. A sudden something rose in his throat as he saw her fumbling at the doors of the cabinet. Where had she found that carefully guarded key?—Aha, he knew! That fellow Hatherley!—Hatherley had taken a cigar from his case as they went out for their stroll together that luckless morning; and instead of returning the case to its owner, had laid it down in his careless way on the study table. He always kept the key concealed in the case.—Winifred must accidentally have found it, and tried to worm out her husband's secrets.—He hated such meanness in other people. How much, he wondered, had she found out now after all for her trouble?

Ah!

They both cried out in one voice together; for Winifred had opened a pigeon-hole box with the special key, and was looking intently with rigid eyes at—a small gold watch and a bundle of letters.

With a wild dart forward, Hugh tore them from her grasp and crunched them in his hand; but not before Winifred had seen two things: first, that the watch was a counterpart of her own—the very watch Hugh had given to Elsie Challoner; second, that the letters were in a familiar hand—no other hand than Elsie Challoner's.

She fronted him long with a pale cold face. Hugh took the watch and letters before her very eyes, and locked them up again in their pigeon-hole, angrily. 'So this is how you play the spy upon me!' he cried at last with supreme contempt in his voice and manner.

But Winifred simply answered nothing. She burst into a fierce wild flood of tears. 'I knew it!' she moaned in an agony of slighted affection. 'I knew it! I knew it!'

So, after all, in spite of her flight and her pretended coolness, Elsie was corresponding still with her husband! Cruel, cruel Elsie! Yet why had she given him back his watch again? That was more than Winifred could ever explain

in her simple philosophy. She could only cry and cry her eyes out.

CHAPTER XXXI.—COMING ROUND.

When Warren Relf steered back his barque to San Remo and Elsie that next autumn, he had not yet exactly been 'boomed,' as Edie had predicted; but his artistic or rather his business prospects had improved considerably through the intervening summer. Hatherley's persistent friendly notices of his work in the *Charing Cross Review*, and Mitchison's constant flow of rhapsodies about his 'charming morbidezza' in West-end drawing-rooms, had begun to bring his sea-pieces at last more prominently into notice. The skipper of the *Mud-Turtle* had gone up one. It was the mode to speak of him now in artistic coteries, no longer as a melancholy instance of well-meaning failure, but as a young man of rising though misunderstood talent. His knowledge of 'values' was allowed to be profound. To be sure, he didn't yet sell; but it was understood in astute buying circles that people who could pick up an early Relf dirt cheap and were prepared to hang on long enough to their purchase, would be sure in the end to see the colour of their money.

That winter at San Remo was the happiest Warren had yet passed there; for he began to perceive that Elsie was relenting. In a timid, tremulous, shamefaced, unacknowledged sort of way, she was learning little by little to love him. She would not confess it at first, even to herself. Elsie was too much of a woman to admit in the intimacy of her own heart, far less in the ear of any outside confidante, that having once loved Hugh she could now veer round and love Warren. The sense of personal consistency runs deep in women. They can't bear to turn their backs upon their dead selves, even though it be in order to rise to higher and ever higher planes of affection and devotion. Still, in spite of everything, Elsie Challoner grew by degrees dimly aware that she did actually love the quiet young marine painter. She had a hard struggle with herself, to be sure, before she could quite recognise the fact; but she recognised it at last, and in her own heart frankly admitted it. Warren was not indeed externally brilliant and vivid, like Hugh; he didn't sparkle with epigram and repartee. But while Hugh scintillated, Warren Relf's nature burned rather with a clear and steady flame. It was easy enough for anybody to admire Hugh; his strong points glittered in the eye of day: only those who dip a little below the surface ever reached the profounder depths of good and beauty that lay hid in such a mind as Warren's. Yet Elsie felt in her own soul it was a truer thing after all to love Warren than to love Hugh; a greater triumph to have won Warren's deep and earnest regard than to have impressed Hugh's fancy once with a selfish passion. She felt all that; but being a woman, of course she never acknowledged it. She went on fighting hard against her own heart, on behalf of the old dead worse love, and to the detriment of the new and living better one; and all the while she pretended to herself she was thereby displaying her profound affection and her noble consistency. She must never marry

Warren, whom she truly loved, and who truly loved her, for the sake of that Hugh who had never loved her, and whom she herself could never have loved had she only known him as he really was in all his mean and selfish inner nature. That may be foolish, but it's intensely womanly. We must take women as they are. They were made so at first, and all our philosophy will never mend it.

She couldn't endure that any one should imagine she had forgotten her love and her sorrow for Hugh. She couldn't endure, after her experience with Hugh, that any man should take her, thus helpless and penniless. If she'd been an heiress like Winifred, now, things might perhaps have been a little different; but to burden his struggling life still further, when she knew how little his art brought him, and how much he longed to earn an income for his mother and Edie to retire upon—that she couldn't bear to face for a moment. She would dismiss the subject; she would make him feel she could never be his; it was only tantalising poor kind-hearted Warren to keep him dangling about any longer.

'Elsie,' he said to her one day on the hills, as they strolled together, by olive and pinewood, among the asphodels and anemones, 'I had another letter from London this morning. The market's looking up. Benson has sold the "Rade de Villefranche."'

'I'm so glad, Warren,' Elsie answered warmly. 'It's a sweet picture—one of your loveliest. Did you get a good price for it?'

'Forty guineas. That's not so bad as prices go. So I'm going to buy Edie that new dinner dress you and I were talking about. I know you won't mind running over to Mentone and choosing some nice stuff at the draper's there for me. Things are looking up. There's no doubt I'm rising in the English market. My current quotations improve daily. Benson says he sold that bit to a rich American. Americans, if you can once manage to catch them, are capital customers—"patrons," I suppose, one ought to say; but I decline to be patronised by a rich American. I think "customer," after all, a much truer and sincerer word—ten thousand times as manly and independent.'

'So I think too. I hate Patronage. It savours of flunkeydom; betrays the toadyism of fashionable art—the "Portrait-of-a-Gentleman" style of painting.—But oh, Warren, I'm so sorry the Rade's to be transported to America. It's such a graceful, delicate, dainty little picture. I quite loved it. To me that seems the most terrible part of all an artist's trials and troubles. After you've learned to know and to love it tenderly—after it's become to you something like your own child—an offspring of your inmost and deepest nature—you sell it away for prompt cash to a rich American, who'll hang it up in his brand-new drawing-room at St Louis or Chicago between two horrid daubs by fashionable London or Paris painters, and who'll say to his friends with a smile after dinner: "Yes, that's a pretty little thing enough in its way, that tiny sea-piece there. I gave forty guineas in England for that: it's by Relf of London.—But observe this splendid "Cleopatra" over here, just above the sideboard: she's a real So-and-so"—torture itself will not induce the present chronicler to name the particular painter

of fashionable nudities whom Elsie thus pilloried on the scaffold of her high disdain—"I paid for that, sir, a cool twenty thousand dollars!"'

Warren smiled a smile of thrilling pleasure, and investigated his boots with shy timidity. Such sympathy from her outweighed a round dozen of American purchasers. 'Thank you, Elsie,' he said simply. 'That's quite true. I've felt it myself.—But still, in the end, all good work, if it's really good, will appeal somehow, at some time, to somebody, somewhere. I confess I often envy authors in that. Their finished work is impressed upon a thousand copies, and scattered broadcast over all the world. Sooner or later it's pretty sure to meet the eyes of most among those who are capable of appreciating it.—But a painting is a much more monopolist product. If the wrong man happens at first to buy it and to carry it into the wholly wrong society, the painter may feel for the moment his work is lost, and his time thrown away, so far as any direct appreciation or loving sympathy with his idea is concerned.—Still, Elsie, it gets its reward in due time. When we're all dead and gone, some soul will look upon the picture and be glad. And it's a great thing to have sold the Rade, anyway, because of the dear old Mater and Edie.—I'm able to do a great deal more for them now; I hope I shall soon be in a position to keep them comfortably.—And do you know, somehow, these last few years—I'm ashamed to say it, but it's the fact none the less—I've begun to feel a sort of nascent desire to be successful, Elsie.'

Elsie dropped her voice a tone lower. 'I'm sorry for that, Warren,' she answered shyly.

'Why so?'

Elsie dissimulated. 'Because one of the things I most admired about you when I first knew you was your sturdy desire to do good work for its own sake, and to leave success to take care of itself in the dim background.'

'But, Elsie, I've many more reasons now to wish for success.—You know why—I've never told you, but I begin to hope—I've ventured to hope the last few months—I know it's presumptuous of me, but still I hope—that when I can earn enough to make a wife happy'—

Elsie stopped dead short at once on the narrow path that wound in and out among the clambering pine-woods, and fronting him full, with her parasol planted firmly on the ground, cut him off in a desperately resolute tone: 'Warren, if I wouldn't marry you unsuccessful, you may be quite sure success at anyrate would never, never induce me to marry you.'

It was the first time in all her life she had said a single word about marriage before him, and Warren therefore at once accepted it, paradoxically but rightly, as a good omen. 'Then you love me, Elsie?' he cried, all trembling.

Elsie's heart fluttered with painful tremors. 'Don't ask me, Warren!' she murmured, thrilling. 'Don't make me say so.—Don't worm it out of me!—Dear Warren, you know I like you dearly. I feel and have always felt towards you like a sister. After all I've suffered, don't torture me more.—I can never, never, never marry you!'

'But you do love me, Elsie?'

Elsie's eyes fell irresolute to the ground. It was a hard fight between love and pride. But

Warren's pleading face conquered in the end. 'I do love you, Warren,' she answered simply.

'Then I don't mind the rest,' Warren cried with a joyous burst, seizing her hand in his. 'If you love me, Elsie, I can wait for ever. Success or no success, marriage or no marriage, I can wait for ever. I only want to know you love me.'

'You will have to wait for ever,' Elsie answered low. 'You have made me say the word, and in spite of myself I have said it. I love you, Warren, but I can never, never marry you!'

'And I say,' Edie Relf remarked with much incisiveness, when Elsie told her bit by bit the whole story that same evening at the Villa Rossa, 'that you treated him very shabbily indeed, and that Warren's a great deal too good and kind and sweet to you. Some girls don't know when they're well off. Warren's a brick—that's what I call him.'

'That's what I call him too,' Elsie answered, half tearful. 'At least I would, if brick was a word I ever applied to anybody anywhere. But still—I can never marry him!'

'Thank goodness,' Edie said, with a jerk of her head, 'I wasn't born romantic and hysterical. Whenever any nice good fellow that I can really like swims into my ken and asks *me* to marry him—which unfortunately none of the nice good fellows of my acquaintance show the slightest inclination at present to do—I shall answer him promptly, like a bird—Arthur, or Thomas, or Guy, or Walter, or Reginald, or whatever else his nice good name may happen to be—Mr Hatherley's is Arthur—and proceed at once to make him happy for ever. But some people seem to prefer tantalising them. For my own part, my dear, I've a distinct preference for making men happy whenever possible. I was born to make a good man happy, and I'd make him happy with the greatest pleasure in life, if only the good man would recognise my abilities for the production of happiness, and give me the desired opportunity for translating my benevolent wishes towards him into actual practice. But good men are painfully scarce nowadays. They don't swarm. They retire bashfully. Very few of them seem to float by accident in their gay shallows towards the port of San Remo.'

SCOTCH BANKING AS A PROFESSION.

OFFICIALS.

THE ordinary definition of an official, as understood by the banks, is an officer who is authorised to sign official documents on behalf of the bank with which he is connected. Before entering into the official domain, it may be proper to state that there is a sort of intermediate class who occupy a position midway between clerks and officials. These are the Inspectors. When an inspecting bank officer is on his rounds overhauling branch-work, he is an official representing his bank; but when he returns to the head office, his rôle of representative ceases, and he then partakes more of the character of a clerk. There is no department of the bank more important than this audit or inspecting department, which takes account of the whole *personnel* and *matériel* of every

branch of the bank. Nothing is out of its purview, and it sees that the policy of the bank is given effect to; for it is policy, as Lord Beaconsfield once observed, that shapes expenditure. The inspecting officers are the *corps d'élite* of the bank's staff; and no better field for training bankers can be found than in that department. A single statement will suffice to show this. Within the past twenty years no fewer than five managers of Scotch and English banks have been furnished by the inspecting officers of one bank alone, irrespective of the agencies and other posts which have been supplied from the same source. This will give some idea of the value of an inspector's experience in fitting and qualifying him for filling the higher posts of the bank.

Coming now to the subject of officials, it will give some idea of the number engaged in Scotch banks if we state that at present there are nine hundred and sixty-four offices connected with these banks, including their London offices. This number implies a corresponding number of agents, the title 'manager' being usually confined to Glasgow, Edinburgh, and London offices, or to places where the title has been acquired through the absorption of another and a smaller bank. The next numerous class of officials are the accountants, who rank as a rule next to the agent, and, like him, subscribe documents on behalf of the bank. Then follow the officials at the large branches, and the head-office official staff, of whom the General Manager is the head.

As the branch Accountants form the lowest grade in the official organisation, we shall first speak of them. Their function is that of taking care of the book-keeping at the branch and seeing that all the entries are correctly made. In addition, they are held responsible for the accuracy of the branch returns, which are designed to keep a branch *en rapport* with its head office. The accountant has also charge of the pass-books, which record the dealings of a bank with its customers. When any mistake in the books arises, it is his duty to find it out and rectify it. One of the banks has adopted the system of having accountants at its various offices; while the other banks have but a handful in the entire establishment. The number of these officials might be computed at under two hundred in all.

Advancing to a higher grade, we shall now deal with the most numerous class—the Agents—by defining their duties. These are necessarily determined by the demands of the district in which their office is situated; for the places range from a population of seven hundred and seventy-one—where, it may be mentioned, there are two bank offices—to cities of the magnitude of Glasgow and London. The variety is not only as to the extent of a district, but also as to its productive powers and commercial and agricultural value.

It is always an object of ambition with a bank clerk to become an agent, no matter how small the place. Bank agents have, however, no sinecure in the matter of responsibility, as they are held liable for a certain proportion of the losses which they make on advances, this obligation being defined in the bond which each signs as agent. These losses are sometimes

exacted from agents; but everything depends on the attendant circumstances and the view which is taken by the management of the case. The liability therefor is held *in terrorem* over them. If an agent persists in extending accommodation to his customers contrary to the bank's express instructions, he would be a likely subject for coming within the scope of this rule.

Agents, from their position, have much public trust reposed in them. This leads to their being frequently consulted on matters of business unconnected with the bank, such as investments and the like. Some agents have given advice on such topics, telling what investments should be cultivated, the result being that money has often been lost, particularly in new concerns which have come to grief. It is flattering to have one's opinion asked and to be regarded as an authority, but experience demonstrates the danger of giving advice in money matters, on the issue of which so much depends, and over which so much proverbial uncertainty hangs. It is more prudent to give information only of facts within one's knowledge, and allow the questioner to judge what course should thereafter be followed.

The qualities demanded of an agent are caution, shrewdness, honesty, tact, and attention to duty. Brilliant cleverness is not needed; only a certain amount of knowledge in dealing with figures and with men. An old Highlandman, who was alike provost of a town and agent for a bank, was noted for his pawky tact in disposing of needy applicants for the bank's money. One day a worthy, in whose company he had passed some convivial hours the night preceding, called on him and presented for discount a bill for a small amount, on the strength of the previous evening's conviviality. The pawky Celt coolly regarded the document, and handed it back with the words: 'I canna do't, Charles.—How's your father?' On another occasion, the provost had a bill handed to him by an equally impecunious party. Taking the instrument of debt in his hands, he observed that it was dated a month back, this date being intended to convey the idea that the bill had been kept a whole month without the holder's being necessitated to turn it into cash. Turning to the intending discounteer, he said: 'The ink's no dry, man, and'—*poor!* (blowing the bill away)—'it's a' wind thegither.' A wind-bill means a bill for which no value has been given.

These illustrations serve to show how prompt an agent should be to say no. He must also learn to say it agreeably, for the manner in which a refusal is given goes a long way towards mitigating its severity and breaking its force. He is a real banking diplomatist who can succeed in this.

Agents have to report to their head office on the standing and sufficiency of obligants to the bank, and great firmness is frequently required in dealing with unsecured or doubtful advances. Many individuals consider they are entitled to get from a bank whatever they demand; and that, as there are many partners in a bank, the loss to each must be infinitesimal so far as these individuals' losses are concerned. Some also hold it to be no sin to rob a corporation; and it undoubtedly adds to the difficulties of an agent when he has to deal with persons who have not

the moral perception to see that even a corporation should have the sums it lends refunded to it.

In the appointment of agents, a bank has regard to the wants of each district. A local residenter often obtains a new agency where there is no sufficiently established business, or where a bank must work up from a connection that can only be formed by one who knows the district thoroughly. Hence we see bank agencies filled occasionally by lawyers and factors, or other equally influential members of society who are possessed of interest which they can exert in favour of the bank. It is reckoned that between one-third and one-fourth of the agencies in the banks are filled by agents drawn from the non-banking classes, of whom lawyers form by far the greatest part. These agencies, which require so much fostering local care, are mainly of the smaller order, for untrained bankers could not well carry on the business of the larger branches.

As regards the remuneration of agents, it has been the practice in many cases to allow a commission on the increase in the percentage of deposits over a certain amount, in addition to a fixed salary. This is intended to act as an incentive to the ingathering of deposits, and with a view to quicken the agent's personal zeal for the welfare of the bank. At some branches, payment is made in a fixed salary alone. Agents are allowed house accommodation with minor allowances as may be agreed on, and they have to furnish a guarantee of several thousands for their intromissions.

Promotion from one agency to another depends on the success which attends an agent in his branch management. Some agencies are more easily managed than others, from their being reservoirs for deposits rather than outlets for loans; but as to this much depends on the district. The advances, too, are in some places normal and safe in character, while in others they are precarious from the nature of things. For example, the weather is so uncertain, that the agricultural and fishing industries cannot work so steadily as those which move under less precarious conditions. Foreign prices intervene too; and being factors in the case, affect adversely, as a rule, home interests. There have been cases, happily not common, in which bankers have had to confront forgeries. These occur sometimes when strong pressure is put on obligants to find security for their advances.

There are agents who have been taken into the service owing to the business ability they have displayed in other lines of life. An agent, again, who possesses what is termed a good manner, and who has a pleasing way with ladies, may obtain promotion for these reasons, being thus well adapted for the management of a large deposit business. Glancing at two large agents, or managers as they are called—one in London, the other in Glasgow—we shall find them safeguarding interests represented by several millions of pounds; in fact, between them the greater part of the bank's disposable means. These branch managers enjoy ample discretion in the conduct of the bank's business, tempered by careful supervision. Each sways what is practically an *imperium in imperio*. What tests the discernment and power of decision of agents and managers is the demands

made on them at short notice for temporary unsecured advances. Although these requests are made by men reputed to be wealthy, yet circumstances so change, that it is always a matter of risk to give such advances, which are, moreover, against rule. Yet to every rule there are exceptions, and so a banker must run some risk or lose his customer. Or his clients may be solvent, but may become involved in losses through the bills they have drawn on other people not being met, and thus be compelled to suspend payment. Although a bank is supposed to exact security for the loans it makes, it reckons with loss, and takes it into account in all its calculations, as it has not yet reached the standard of an exact science.

We shall now consider the various offices connected with the body who constitute the official staff of a bank's Head Office. First, the Accountant. His duties are to supervise the work of the staff in his department, and to be responsible for the book-keeping of the bank as expressed in the branch bank returns and the books of the head office. He prepares the statement of the assets and liabilities, and performs the feat called striking profits. In former days, the accountant, or accountant as he was then designated, held office next to the manager of the bank; but the secretary gradually dislodged him from his post, and thus their relative positions have been reversed. The office of accountant is a very onerous one, for the accuracy of all the books and of the staff over whom he presides is dependent on him. The importance of his position was established recently during a notable banking trial. It was then shown that the secretary knew nothing of the concocted statements of the bank's affairs, while the accountant was entirely cognisant of them, he having been a party to the fraudulent alteration of the figures which appeared in the published balance sheets of the bank.

The Cashier's duties lie almost entirely with the cash. He is responsible for the accuracy of the cash in the tellers' hands and in the cash-safe of the bank. He counts all the reserve money, and acts as custodian of the main portion of the keys of the bank's coffers. The safeguarding of the note circulation to meet the requirements of the Peel Act with respect to providing coin for all excess over the authorised issue, is also entrusted to him. The cashier has likewise under his care all the securities and articles of value deposited with his bank for safe keeping. His is the duty, also, of occupying the premises above the bank, so that he shall be within call in any case of emergency. Some cashiers feel the burden of this duty weigh heavily upon them. It is told of a cashier that, on hearing the least noise at night, he would get up out of bed and perambulate the long corridors of the bank house, clad in his night garment, a naked sword in the one hand, and a lantern in the other. He could not sleep until he had reassured himself that the noise he had heard proceeded from satisfactory and explicable causes.

The office of Inspector or Superintendent of Branches is a very important one, if we bear in mind that he is also the head of the inspecting department, to which allusion has already been made. He has the care of all the members of the branch staff, and full reports of the capabilities of each are sent to him. He has the power of

recommending changes and nominating subordinates for the different vacancies that arise from time to time at the branches. Reports on obligants also reach him; and the history of all loans and borrowers' circumstances are carefully laid aside in his pigeon-holes. It is he who sets the machinery at work for overtaking the inspection of the head office and branches, the work of which is done with much more celerity now than in the olden times, when a week or ten days were devoted to the inspection of a single small branch. So thorough was the inspection, that an inspector was once, it is said, called back 'to count the wafers!' Inspections are meant to descend now on branches like bolts from the blue, or like an eagle's sudden swoop, and they are thus more numerous than formerly.

The Secretary of a bank ranks in dignity next to the manager. His duties are varied, and one of them is to act occasionally in room of the manager during the absence of the latter. He carries on that part of the bank's correspondence which is of special value, and is other than routine. It was once stated in a civil case by a secretary that his duty was to submit to his Directors applications for advances, and that he only placed before them those which had any chance of being granted. He attends all meetings of the Board of Directors, prepares the minutes recording the business done, and aids the Directors generally in their deliberations.

We now come to the principal banking functionary, variously termed Treasurer, Cashier, General Manager, and Manager. Of the Scotch bank managers, two only are not trained bankers, one having been a lawyer, and the other an accountant. This circumstance has been no bar to their banking success, and they are also both able literary exponents of banking theory and practice. It would not be easy to define all the duties of a bank manager, but an attempt may be made to state at least the most important of them. He has, subject always to the will of the Directors, the supreme control over the lending and investing of the entire bank's means. All appointments may be said to emanate from him; he judges what is for the best interests of the bank, and decides accordingly. Some managers abide by the recommendations of their departmental chiefs; others prefer to act autocratically in all the appointments they make.

The manager is the real inspirer of the bank's policy, and it must be admitted that he occupies an unexceptionable position for obtaining knowledge of everything which he had needs know. Loaded as he is with so much responsibility in the disposing of interests so vast, there is this in his favour, that he does not incur one farthing of personal liability, such as agents have to bear, by any act of his when he is lending out to the best of his ability the bank's disposable means. The manager has to receive many persons every day, one of his duties being to listen to applications of all kinds, sometimes on the part of officers for additional salary, for vacant posts, &c. He has also to attend to complaints, and when necessary, administer rebukes to subordinates in connection with matters of discipline. He has to keep himself abreast of everything in the world of finance, in markets, stocks, prices, trade operations, and commercial and agricultural doings. The reports

of his inspectors form a fitting study for his evening leisure hours, and furnish him with food for reflection in observing the progress or declension of a branch. He has also to meet periodically with the managers of the other banks, to fix bank rates of interest, and to arrive at an agreement upon disputed or doubtful points in banking practice.

The last matter which we need touch on is the important one of estimating losses, with a view to arriving at honestly earned profits. It is of course impossible to know what tax is thus placed on the powers of casuistry of bank managers; but they seem to perform their part well, if we may judge by the confidence which the public repose in them. The post of bank manager is an extremely important one, and the holder of it is eminently in a situation from which he can exercise an important and salutary influence on the trade and commerce of the country.

THE SILVER STREAM.

AN IDYL OF THE WYE.

By FRED. M. WHITE.

IN FOUR CHAPTERS.—CHAP. I.

As the shadows began to lengthen over Belmont—for the cathedral chimes floating along the bosom of the waters proclaimed the seventh hour—a long outrigger gig pair flashed round the point into the level stretch of dead pool reaching right away to the Wye Bridge. There was a pleasant smell of flowers lying upon the sweet August air, a lowing of cattle, a reflection of many boats in the track as the gig, propelled by four muscular arms, slid on towards the town. There were only two men in the narrow craft; and as they were double sculling, with long clean sweep, making a musical click of oars in the rowlocks, there was not much opportunity for conversation. The 'stroke,' a young fellow with clear gray eyes and pleasant face, was clad in a suit of plain white flannels; and perched upon the back of his head was a light-blue cap—the badge of distinction sacred to those only who have fought for the honour of the 'Varsity against their rivals from the twin seat of learning, Oxford. Egbert—or as his familiars called him—Bertie Trevor, the stroke in question, had rowed 'four' in that year's Cambridge boat, and now, with his friend Frederick Denton, was making a Wye boating tour from Hay to Chepstow. Denton, a somewhat older man, sported the light-blue and black of Caius College. He was not a blue, for two reasons: first, because the severe training was not to his taste; and secondly, a restless ambition and the result dependent upon a successful university career had left him no time for such a serious and practical business. A hard-working college tutor has no time for the toil of pleasure.

They pulled on with regular sweeping rhythm till they were almost within the bridge-shadows. An arrowy craft bearing a town four rushed by with clean sweep and swirl up-stream, a little knot of admirers running along the bank in the wake of a flannel-clad youth who was bent upon exer-

cising an extraordinary ingenuity for giving each of the unhappy crew the most apparently contradictory directions. As they sped swiftly by, Denton paused in his stroke and looked over his shoulder at the thin line, like a gigantic spider, fading in the golden track.

'That is what some people call pleasure,' he observed—'sacrificing a perfect summer evening for the satisfaction of sitting in a confined space for two hours to be bullied by an implacable miscreant called a coach. Depend upon it, if it was called work, they wouldn't get a man to turn out.'

'I like their stroke,' Trevor replied. 'Well marked and lively, and the last ounce pulled out.—What a grand stretch of water this is, Denton!—two miles without a curve, and room for at least five eights. If we only had such a river at Cambridge!'

A few more strokes and the landing-stage was reached. A bronzed waterman, with visage tanned to the colour of Spanish mahogany, awaited them on the barge: old 'Dick' Jordan, with his solitary keen eye and everlasting pipe, best of men and bravest of watermen, as every rowing man on the Wye can tell. He looked up into the fading blue sky and prophesied, after the manner of his kind, a fair day on the morrow.

'What time be you gentlemen going to start in the morning?' he asked, addressing Trevor, whose light-blue cap he had immediately spotted.

Trevor turned to his friend and asked what hour it was to be.

'It depends altogether upon Phil, you know. He may get here to-night, or not till to-morrow afternoon.—We must leave it open, Dick. Only, you had better have everything ready by ten o'clock.'

The two friends strolled together over the old stone bridge, below which lay the cathedral and bishop's palace, with the trim cloister gardens sloping down to the water-side. The clean city lay very quiet in the evening. As they passed through the close, under an avenue of ancient elms, there was a clamour of rooks in the feathery branches, clear cut against the sky. Turning into Castle Street, Denton came to a house at length, the door of which he opened with a latchkey; for the twain had deemed it best to take a lodging, instead of availing themselves of the accommodation of the *Green Dragon*. In the hall were two small portmanteaus, bearing the monogram P. D. in neat black letters. Denton's face lighted with pleasure. In the joint sitting-room up-stairs there were the remains of a meal, as if some one had recently partaken of refreshment; and on the table a card, upon which were written the words, 'Back in half an hour.'

But the appointed time went on, and the expected guest had not reappeared. Tea had been disposed of; the windows were thrown open, and our friends sat over their pipes, looking out upon the Castle Green, where the world of Hereford was taking its pleasure in the cool summer evening.

'I wonder what has become of Decie?' Trevor observed. 'It's nearly nine o'clock.'

'I hope he isn't going to make an ass of himself as he did in the Easter "Vac,"' Denton said practically. 'You never saw such a wet blanket; and a fellow who had just come into a clear

three thousand a year, too! And twelve months ago there wasn't a cheerier, happier man in the 'Varsity.'

Trevor pulled at his pipe a few moments in reflective silence. 'I noticed the change when we were at Cookham together at the commencement of this "long." Colden had a houseboat there with a lot of people in the party; and when Dixon and I agreed to join, Phil cut it. After agreeing to join, too! Miss Rashleigh was one of them; and, between ourselves, Decie would have jumped at the chance of meeting her once.'

'Oh, Miss Rashleigh was there!' Denton replied reflectively. 'My dear Bertie, did it ever strike you that that was the very reason why Phil threw over Colden at the last moment? I daresay you won't believe me, but it is the fact nevertheless.'

'We used to think Phil would have married her.'

'We were not the only people who thought so: anyway, there was something between them. She is a nice girl; and I dare swear that if anything was wrong, it wasn't her fault. Phil was poor enough then; but she liked him better than any of us, all the same. Everything seemed to go smoothly enough, till that unpleasant affair over the diamond bracelet.'

'I never heard of it,' said Trevor. 'Where was that?'

'Well, perhaps I ought not to mention it; but I was under the impression you knew. It was during the May races last year—you didn't keep that term I recollect now. And they were all up there—Colonel Scobell and his family, with Miss Rashleigh, who is his niece, you know.—I was all the more put out because the affair happened in my rooms. The Scobells had been very kind to Decie the "long" before, and nothing would do but he must give them a lunch; and my rooms, being some of the best in the college, were borrowed for the purpose. Miss Rashleigh's diamond bracelet, the last thing her mother gave her before she died, was lost.'

'Seems strange to lose a thing like that in a man's rooms.'

'Precisely—that is the most unpleasant part of it. It was only laid down for a moment in an inner apartment; and when Miss Rashleigh went in, it was gone. No servant had been there—no one but Decie and Gerard Rashleigh, her brother, you know.—Anyway, it was never found.'

'What do you make of it?' Trevor asked cautiously. 'Valuable trinkets like that don't disappear without aid. Still, at the same time, it would be absurd to dream of Phil having a hand in it.'

Denton watched the smoke curling round his head for a few minutes. His next words startled Bertie out of his philosophic calm: 'We shouldn't; but there is no doubt Miss Rashleigh did—and does.'

'My dear Fred, you rave! Philip Decie would cut off his right hand first. Besides, with all his money'—

'Now, see how rash youth rushes to conclusions.—How long is it since Philip's uncle died and left him a fortune?—Five months. And up to that time, if you had searched the university

of Cambridge through, you would not have found a poorer undergraduate than Decie.'

'But surely you don't think'—

'Of course I don't; and if you suggest such a thing, I shall assault and batter you in the first degree. But I know a little more about women than you; and, to put it harshly, I have a strong suspicion that Miss Rashleigh entertains the enlightened idea that Phil stole her bracelet.'

'Only shows the sagacity of some women,' returned the enlightened philosopher of twenty-three saptiently.—'Why, I would trust my life to old Phil.—Great Scott! Denton, fancy any one—any one being idiot enough to believe that Decie could do such a blackguardly thing!'

Bertie laid aside his pipe in disgust, and regarded Hereford's innocent citizens below as if they, with the rest of mankind, had done him a personal and irretrievable injury. But any reply of Denton's was prevented by the entrance of the maligned hero in question. There was nothing in either air or manner to denote the blighted swain. Decie presented a picture of the typical Englishman of twenty-five as he appears under the advantages conferred upon most young men by a liberal education, and an acquaintance with the refinements and amenities of life in the upper middle classes. Like the others, he was clad in flannels and boating jacket, the distinguishing badge of a Trinity man. With the exception of a half-melancholy smile and a certain sombre light in the dark eyes, sorrow or care had laid a light hand upon him.

'I am sorry to have kept you waiting,' said he, after the first greeting; 'but the fact is I strolled into the *Dragon* billiard-room, and the first man I saw there was Du Maurier.'

Denton coughed dryly, a sternutation which might have meant anything, but which, as both Decie and Trevor were aware, simply denoted Denton's dislike of the individual in question. 'What brings that desirable youth in these parts?' he asked. 'I thought he usually spent his vacation at Monaco or Monte Carlo, where fools with more money than brains most do congregate.'

'Appears he is staying in the neighbourhood,' Decie answered briefly. 'Some friend who has taken a house down the river. The Frenchman is not communicative, and I didn't press him, you may be sure.'

'Well, it doesn't matter.—And now, anent to-morrow. I suppose there is no reason why we shouldn't start at nine o'clock?'

Phil nodded, without taking his pipe from his mouth. It was all one to him what time they started, for, sooth to say, his first enthusiasm in the trip had vanished, and he felt in no mood for discussing details which once upon a time would have been a source of interest and pleasure. Moreover, the meeting with Du Maurier—a fascinating Gaul, who had, for certain diplomatic reasons, deemed it advisable to become a Cambridge undergraduate—had aroused within him the rankling soreness of an old wound, which he flattered himself had long since entirely healed. In spite of Denton's brusqueness and apparent want of feeling, he was naturally of a tender sympathetic disposition, and refrained from rallying Phil upon his preoccupation, a want of attention for which the latter was truly grateful.

So, upon the whole, the long-expected meeting could not be pronounced a brilliant success.

But when morning dawned, with a fair blue sky and a gentle breeze rippling in the immemorial elms, it was not in the elastic and buoyant nature of youth in the twenties to preserve the grave decorum of misanthropy. The gig, provided with a pair of long light oars, and short pole for stream-work, lay alongside the barge, her bows filled with multitudinous packages, and covered with a waterproof sheet calculated to afford a haven of shelter at nights. A few minutes past ten they swung round, shooting the pointed stone arches, floating past the palace and cloister gardens, down the rippling stream, with the fair meadows sloping towards the valley lying in the bosom of a ring of purple hills. Gradually they slid down in the beautiful morning, along by fair homesteads and quaint gabled farmhouses, through silent pools where the blue flash of the kingfishers darted in zigzag flight, or over broad rippling streams where the salmon nets hung drying on the willows. Decie and Trevor were rowing; Denton lounging in the sternsheets, smoking lazily, or making humorous remarks upon the fishermen as they passed.

'Every man has a vocation in life,' he observed sententiously, 'though fate so often ordains a round peg for a square hole. If I hadn't been a hard-working university coach, I should have made a perfect loafer.'

'To see you now, any one would think you were the idlest man under the sun,' Bertie returned between the strokes; 'and yet you profess to despise affectation. There isn't a more ambitious fellow in Cambridge than you.'

'I don't know about that, though. It runs in too many grooves. There is Barton, of Jesus, with a sole ambition to get his boat head of the river again; Moffat, my old tutor, who is wild to become Professor of some ology at Trinity; or young Rashleigh, the cleverest pupil I ever had, whose ambition seems to be to get to the dogs in the shortest possible space of time.—You remember him, Phil?'

Phil, pulling bow-oar, with his face hidden from the speaker, flushed with something more than the exertion he was undergoing, replied through his set teeth that he did. And, considering that the youth in question was only brother to the particular star of poor Phil's slighted devotion, it is only too palpable that he spoke the truth.

'I have not seen him for a long while,' he continued, fearful, with all the painful self-consciousness of a lover, that his silence would be read and misconstrued. 'We—we used to be rather thick, you know. I—I have rather fancied that for the last term or two he has fought shy of me.'

'He seemed to have drifted into a precious bad set,' said Bertie, with all an athlete's contempt for the venial sins of college life—'Everton and Leslie, and the card-playing, tandem-driving division. Of course, it is no business of mine; but knowing a little of Rashleigh's financial affairs, I don't see how it can last.'

'It won't last,' Denton returned. 'There will be a scandal some of these days, and exit Gerard Rashleigh and a few others who shall be nameless. And yet,' continued the speaker regretfully, 'it's a pity, a great pity—a lad like that with good feelings and generous instincts, only wanting

a kind, firm guide to turn out a credit to himself and his college.'

'You are altogether mistaken, Denton. Young as he is, Rashleigh is a hardened, unscrupulous scoundrel.'

Denton propped himself upon his elbow so that he could get a better glance at the speaker's face. Phil's eyes were glowing with passion, every feature blazing with indignation. As his glance fell upon Denton's amazed countenance, he checked himself with a visible effort and bit his lip.

'Now, that is the sort of house I should like to call mine,' said the steersman, with an abrupt change in the conversation, as he indicated a noble-looking residence rising out of a belt of trees upon an abrupt eminence. 'If I have a weakness, it is for a half-timbered house. I could close my eyes and dream æsthetic dreams of future bliss, were I the owner of yon paradise.'

He closed his eyes as he spoke; while Trevor laughed at this simulated ecstasy. It was not a particularly brilliant or humorous remark, but anything was better than the awkward silence caused by Decie's impulsive words. But in reality the wily Denton was lost in no earthly paradise; he was racking his brains to discover the mystery underlying Phil's emphatic utterance. The spectacle presented at this point by an elderly gentleman in a tweed shooting-cap and waders wielding a salmon rod at the head of a broad stream was hailed by all three as a positive relief to the feeling of constraint which had fallen upon them.

'If I was a betting man,' Bertie cried with suppressed excitement, 'I should make a small wager that is Colonel Scobell.'

Decie turned his eyes in the direction of the fisherman. A few powerful strokes brought them nearer. 'It is the Colonel. What brings him here?' he said.

'Any sport, Colonel?' cried Trevor in his audacious style.—'How do they die?'

Colonel Scobell, in the act of making a cast, paused, and got his 'butcher' hopelessly entangled in the willows behind. Denton steered the boat to the side; and the old Crimean hero stood knee deep in the rushing stream, offering a sinewy brown hand to each of the watermen in turn.

'You are a nice lot of fellows to come into my neighbourhood without letting me know,' he exclaimed. 'Explain yourselves.'

'Now, mark the pride of the man!' said Denton oracularly. 'His neighbourhood! Think of it! And only last year he had the audacity to use the same expression, which—correct me if I am wrong—included the whole of the Thames valley.'

The Colonel explained that he had taken for the summer months the mansion which had so excited the last speaker's envy. It struck the kind-hearted warrior, directly he had heard the wanderers' plans, that it would be a good joke to take them all up to Pencraig, as the house was termed, and keep them there for a few days. And knowing from old experience that any argument with one of the grandest of nature's gentlemen would be so much wasted time, they accepted the offer with something akin to gratitude.

Without waiting for his rod, the Colonel led the way up the rocky path, leaving Phil to arrange some little matters connected with the boat. Ten minutes later, as he turned to follow,

the bushes parted, and a figure with nether limbs clad in knickerbockers and a straw hat perched upon his head stood before him. The new-comer eyed Decie with a peculiar glance, in which fear and deference, defiance and mistrust, were strangely mingled. Phil recoiled as one does instinctively from a noxious animal, though the individual before him was neither unpleasant nor repulsive to the view.

'What, in the name of all that's evil, brings you here?' he cried.—'Look here, Rashleigh: I don't want to do anything unpleasant, for the sake'—

'Oh, drop that,' cried the other doggedly. 'The fact is I am staying here with Scobell; and when I met the other fellows, I thought I would run down and warn you I was here. You needn't make it unpleasant for Beatrice, if you do for me.'

'Beatrice! Is she here too?'

'That's just what I came to tell you. If you mind'—

'Of course I mind,' said Phil, with a deep sternness which would have astonished Denton had he but seen it. 'Do you think I would have come, had I known? If you had a spark of manliness, you could put a stop to all this misery and trouble.'

NEW MOTIVE POWER FOR SHIPS.

THE steady progress which is being made in mechanical science has received another illustration by a novel method of propelling ships which has just been submitted to the naval profession. The representative of this new type of vessel is the *Zephyr*, the second of its kind, which has been constructed from the designs of Mr A. F. Yarrow, of Messrs Yarrow & Company, the well-known firm of torpedo-boat builders of Poplar, London, and which was brought under the notice of the Institution of Naval Architects at its recent meeting.

The construction of the vessel differs very little from steam-launches, except that the machinery is placed right at her stern, whilst the fuel is carried in a tank in her bows, the intervening space being reserved for passengers, cargo, &c. It is in connection with the propulsion of the boat that a new departure has been taken, the fuel used being a highly volatile hydrocarbon, one of the early products in the distillation of petroleum, having a specific gravity of from 0.725 to 0.73. This liquid is an article of commerce in the United States, and can be purchased there at the rate of fivepence per gallon. The novelty of its application is that the vapour of this hydrocarbon is made to serve at the same time as the fuel and propelling agent. As to the *Zephyr*, this vessel is thirty-six feet in length by six feet beam, and is built of steel. The hull weighs fourteen hundredweight and the machinery six hundredweight, making a weight of one ton. There is nothing in the construction of the hull which calls for special remark; nor is the propelling machinery—an ordinary direct-acting inverted engine provided with the usual link-motion, feed-pumps, &c.—of an exceptional type.

It is the mode of feeding and actuating the engine alone which strikes us as novel. It is fed by a vapour-generator situated immediately aft of the engine. The generator is a copper coil

enclosed within a double sheet-iron casing, the intermediate space between these two casings being filled with asbestos. Below the coil is an iron pipe, bent into the form of a ring, perforated with holes, and arranged, as in a Bunsen burner, in such a manner that a mixture of hydrocarbon and air can be forced into it, and ignited on issuing through the holes. As has been stated, the tank for holding the liquid fuel is placed in the bow compartment of the boat. It is of copper, air-tight, and of forty gallons capacity. Care is taken that the bulkhead aft of it is perfectly water-tight, so as to avoid any possibility of the liquid finding its way into the central portion of the boat. This tank is placed in communication with the feed-pumps of the engine by means of a pipe passing outside the boat near to the keel; the feed-pumps delivering into the bottom of the vapour-generator. There are two hand-pumps, one on the port and the other on the starboard side. By working the port pump, which has its suction in connection with the tank, its delivery joining the delivery-pipe from the pumps on the engine, the hydrocarbon is drawn from the tank and forced into the bottom of the coil. The starboard pump forces air into the top of the tank; the air becomes charged with vapour, and passes back through a pipe carried along the gunwale to a supplementary burner placed below the vapour-generator, and arranged to ignite the main burner immediately it comes into operation.

In order to start the launch, the air-pump on the starboard side is first worked by hand; and as soon as the air charged with vapour finds its way to the supplementary burner, it is ignited by means of a taper, and heats the copper coil. The air-pump is maintained steadily working for from two to six minutes, according to the temperature of the coil and its surroundings. When the copper coil has in this manner been warmed up, a few smart strokes are made with the hand-pump on the port side, and the liquid from the tank is forced into the coil. The gauge indicating the pressure within the coil immediately rises rapidly, and then a communication is made by opening a valve in a pipe connecting the upper part of the coil with the main burner, allowing a small quantity of the vapour to pass into the burner, together with a requisite amount of air, which is drawn in with it, and on issuing from the holes is immediately ignited.

When this has been fairly started, the air-pump is not further needed, and so long as the pressure is maintained in the coil the flame will continue. The engine can now be started, the main feed-pumps at once taking the place of the hand feed-pump, which can be stopped. From this moment, the action throughout is automatic, and continues as long as the supply of liquid in the tank lasts, which is stated to be about thirty hours, the consumption being about a gallon and a quarter per hour. When once started, neither engine nor what is described as the boiler requires any further attention. Experience has shown that the launch can be run at a speed of from seven to eight miles an hour for several hours without any attention whatever being required, excepting occasionally lubricating the bearings. The working pressure can be easily maintained at about seventy pounds per square inch. On leaving the engine, the exhaust-vapour passes into two con-

densing pipes, placed one on each side of the keel, where it is condensed, and forced by the engine back into the tank, where it arrives in its original fluid form.

It will be seen from this brief description that there are several important points in which this system—which, we understand, is the invention of a foreign engineer, and has been worked into practical shape by Mr A. F. Yarrow—is superior to steam. The fuel-supply requires no attention until that stored in the tank is used up, being perfectly self-acting, all hand-firing being abolished. Owing to the absence of coal, the whole arrangement is very cleanly. Moreover, one person, with ease and comfort, can take charge both of the arrangement of the machinery and steering. To stop the boat, all that is necessary is to cut off the supply of vapour, and no further attention is required. As will further be seen from the description given, the vapour consumed is practically that which goes to the burner, since that which performs work in the engine is exhausted into the condensing pipes running along the bottom of the boat, and is forced back to the tank, to be used over and over again, the only consumption taking place at the burner heating the coil. There are, however, other important advantages attaching to the system. It has been found that on an average, in this climate, the time required to start the launch at full speed, from lighting up, does not exceed five minutes. Owing to the comparatively small space occupied by fuel, generator, and machinery, the central portion of the vessel is available for carrying purposes, and may be roughly estimated as not far from being doubled, as compared with steam. There is a very large saving in weight of machinery, owing to the small size of the vapour-generator, which is so light that two men can easily lift it. This reduction in weight renders lighter scantling of hull admissible, which is apparent from the fact that the launch (thirty-six feet long) with machinery complete weighs only one ton. All the points mentioned will make it evident that in the *Zephyr* we have a new type of vessel which promises well.

It is the intention, we understand, to apply the principle first to launches, torpedo-boats, and other small craft; but as experience ripens, its application to large vessels is a contingency which may be looked forward to. Whatever its ultimate measure of success may be, we may be sure that, in the hands of an experienced shipbuilder like Mr Yarrow, the invention bids fair to cause a revolution in marine propulsion.

THE HUMOURS OF GASOPOLIS.

'Now, in the reign of Victoria, Queen over Britannia, there were in that city which is called Gasopolis many great and mighty scribes.' So runs the Chronicle of Gasopolis as published in its official organ, *The Lighthouse*.

It matters little where Gasopolis is situated: suffice it to say it is in the Emerald Isle, and that the function of its inhabitants, as described in the Chronicle, is 'to enlighten the habitation of the people and keep their lamps burning.' As for *The Lighthouse*, few outside the city have heard of

it; not on account of its inferiority to other journals, but on account of its publication in manuscript form, and therefore never exceeding a circulation of one. Thinking that a smattering of its contents might be appreciated by a larger circle of readers, its editor has put together a few of its 'official anecdotes' in a connective form; and he gives the result to the public with the assurance that whatever he may state is the 'plain unvarnished' truth.

A scribe in Gasopolis has many opportunities of studying his fellow-mortals. All sorts and conditions of men pass before him daily; and, to a person who can appreciate unconscious humour, the study of the working-classes affords an endless source of pleasure. I say 'working-classes' advisedly; for it is only among such that I have found unconscious humour. Education has done and is doing much for mankind; but it destroys that delightful blundering—that 'touch of nature' which 'makes the whole world kin;' and it is surely a wise arrangement of Providence that all men cannot be scholars, else our earth would lose that 'boundless laughter' which brightens life.

To describe the official machinery of Gasopolis is not within the province of this article; but to give connection to my remarks it will be necessary to mention some of the functions of the various officials. And first, there is the scribe who receives the application for gas, or notice to stop the supply, and attends to all complaints in reference to bad lighting, defective meters, and the like.

In taking an application, we require the signature of the applicant; and the apostles of compulsory education would have a strong point in favour of their system, if they had an opportunity of entering Gasopolis and witnessing a few *His Mark* applications. I believe there is not a class of greater hypocrites under the sun than the persons who can't write. I have witnessed a good many signatures in my time; and I can confidently state that the majority of *His* or *Her Mark* individuals, rather than confess their ignorance, resort to mean excuses; such as: 'Ah, just do it yourself; I came away and forgot my glasses, and I can't see a thing without them;' or: 'You can write for me; my hands are so cold I couldn't hold the pen.' I remember accidentally testing an applicant who made the latter excuse, by touching his hand with my little finger as he made his mark, and his hand was quite hot.

It was while attempting to sign his name to an application form that a man uttered a statement which, if it became generally applicable, would considerably affect the sale of soap; and would tax Messrs Pears's ingenuity to the utmost to invent an advertisement which would have the desired effect on the wearers of eye-glasses. The man referred to, before signing his name, endeavoured to fix a somewhat ponderous black-rimmed eyeglass on his right eye;

but each time he bent his head to write the glass fell. Being accompanied by a woman, who was watching him with evident interest, and feeling that some explanation was necessary, he turned to her and remarked in a confidential manner: 'As sure as ivir I wash my face, I can't get the glass to stick on.'

Remarks on our personal appearance are sometimes made by kindly disposed persons. One old gentleman, a tailor by trade, once gave us a short history of a knight who was at that time in a high position in the town. 'I remember him,' he said, 'coming to town a pale, sickly youth, just like that young man'—and he pointed to me—'and look what he is now! How did he rise to such a position?—By passiverence!—And what I say to you, young man, is, passivere! and there's nothing to hinder you from becomin' as great as he is.' I hope he spoke the truth.

There are some humorous mistakes made in giving notice to take the indication of the meter and stop the supply. Mrs Malaprop herself never said anything better than the anxious-looking little fellow who remarked: 'Please, sir, my da sent me down to see if you wud send a man up to take the indignation of the meter.'

Complaints are numerous in Gasopolis as well as other places; and some individuals have a very graphic way of describing what is wrong. 'Bad light' is one of the most frequent causes of complaint; and women are the most eloquent complainers. A strong-minded-looking female once marched over to me and remarked: 'I dunno what we're goin' to do wi' thon gas of ours! No sooner do we put a light to it than it jist pluffs out among our hands.'—On another occasion, one of the same sex, though cast in a gentler mould, remarked: 'I came to tell you that there's somethin' wrong with our gas. It flutters, you know; blinks a kine o' way.'—But the best and fullest description of 'bad light' was given by a determined-looking woman who uttered something like the following: 'The leadin' main-pipe comin' in from the leadin' street is corrupted. We have no light satisfaction. The pipe's corrupted, the gas-fitter says. It doesn't do, you know, when you're shavin' or hair-dressin', to have the gas jumpin' up and down. You needn't send a man to blow down the pipe, for there was three very respectable men up the last time, and they blowed down the pipe; but it didn't do any better. The pipe's corrupted.' And with the reiteration of the pipe's 'corruption' she stopped, and I was not sorry, for it takes a great deal of self-command to avoid smiling in a case like that.

Thus far I have dealt with one department of the business; but the humour is not all confined to it. At the 'place for the receipt of custom' (*vide* Chronicle) many a remark is made worthy of record; and again the gentler sex have rather the best of it. One middle-aged woman who was paying an account got a three-penny piece with a hole in it in her change. She ferreted it out and returned it with the remark: 'That's a very scrupolous thrupenny bit. I'm afraid they won't take it, they're so scrupolous.'

The misuse of a word is again illustrated by the complaint of a woman about the amount of her husband's account. She said she couldn't understand how his account was so large. 'It's

a small shop, that shuts at seven o'clock; and if you look back, you'll not find such an account either summer or winter.' The scribe in attendance tried to reason with her, but he was completely vanquished when she exclaimed: 'It must be too large; for the equalisation of last quarter was the same.'

There is nothing makes a man look so ridiculous as a 'dhrup too much of the crathur'; and there is nothing makes a man so vehement in the expression of his loyalty to Queen and country as this same beverage, if there is any outward occurrence to give him a starting-point. It happened that His Royal Highness the Prince of Wales was visiting a city not a thousand miles from Gasopolis; his movements were attracting a great deal of attention in the local press; and no doubt the man who uttered the following sentiments was well read in all the news. He was pretty 'far gone' as he marched into the office and made straight for one of the 'receivers of custom.' When he had got in front of him, he drew his right hand up to his face, and placing his forefinger on his nose, remarked: 'The Prince of Wales is as dacent a subject as ivir you travelled under!' This emphatic way of opening the conversation took the scribe a good deal by surprise; but his surprise gradually changed to amusement as the impressive stranger continued: 'Queen Victoria's as good as goold! I'll bate you my life the Prince is a gentleman iviry inch of him! I'll stand on principle he's travellin' on his ma's business!'—and so on; stopping a little between each statement to help it out with an extra pressure on his nose; till he wound up his loyal sentiments by declaring, 'The Old Woman's the best of the lot of them!'

But we needn't go outside Gasopolis for unconscious humour. We have a labourer with a name which no one, least of all himself, knows how to spell. He was doing something against the law of the land one day, and a policeman collared him. His offence was not of such a heinous nature as to lodge him in prison, but the keeper of the peace decided that his name should be taken. So he produced his note-book and pencil and asked the man his name. The man gave it to him, and the policeman looked doubtful. 'How do you spell it?' he asked.—'You don't spell it at all,' replied the man; 'you jist put it down.' And as the policeman found a difficulty in doing so, the man was let off.

Another character about the place is 'Gentleman James,' the window-cleaner. How he got the name, I don't know, but it may have arisen from his fondness for talking about the time he was servant to the 'beeship.' We never could find out where he lived; and if we wanted him particularly, we were 'jist to send word to the corner-house,' which happens to be a public-house; and therein lies the weak point of 'Gentleman James's' life. His conversation is at all times most interesting and amusing; and he has a sly cynical way of giving a dig, which rarely fails to provoke a laugh. The scribes were in the habit of playing tricks on him by hiding his cloths, &c.; and when he had succeeded in finding the lost articles, he would make such remarks as: 'A man's position in life is no guarantee: if he's a thief in his heart, he'll steal;' at the same time drawing attention to the supposed

culprit. At another time he would say: 'Presbyterians are as a rule uncivilised; but'—(naming the offending scribe, who happens to belong to that body) 'is the worst case ivir I saw.'

OUR LEGAL FUTURE.

No doubt shortly the public will have the opinions of some of the highest legal authorities on both sides of a question which is of such great importance to the community at large—namely, the fusion of the two branches of the law; and considering the interest which is shown every day as to its desirability, we think that it may not be out of place to analyse what the proposed change really means. Lawyers' bills have always been a bone of contention to those who are unfortunate enough to have to pay them. We have all heard of the client who, when asked by his lawyer to name any particular item in his bill to which he took objection, replied, that 'he could not discuss items, but that it was the *whole* which was objectionable;' and certainly we can understand the reason of his reply. If by fusion the interests of the public are preserved, whilst their pockets are saved, no reasonable person ought, from any sentimental feelings of conservatism, to oppose such a desirable change.

The examinations which have to be passed by those who wish to enter upon a legal career are very different. Those for solicitors are the harder of the two; and the apprenticeship is not only longer, but more expensive. Why this is so, it is difficult at first sight to understand; but the reason may perhaps be gathered from the fact that a barrister who has neither ability nor industry never rises beyond a certain position, whatever interest he may have to push him forward. He therefore owes his success not to the knowledge which he gains by passing an examination, but to his individual efforts. If the proposed fusion takes place, there will doubtless be one examination for all; and the prizes and scholarships will be more equally distributed. This, however, is not of much importance; but there is another change which might be more seriously felt—we allude to the manufacture of legal literature. It is well known that the majority of law-books are written by barristers, who have not only more leisure, but greater opportunities, for the production of such works. Scores of young men at the bar have too much time on their hands; and they are only too glad to occupy themselves, whether profitably or not, with work which may be of use to them in the future. Law-books are more often written for fame than gain, and there are several instances in which young men owe their reputation to the choice of a lucky subject and a well-written book; whereas solicitors, having no such opportunities, owing to the different nature of their duties, cannot give up their time to such a purpose; and it is hard to conceive who, under the proposed system, will be found to write books of such a nature. Moreover, the circulation of law-books is extremely limited, as opposed to other kinds of literature; and few would be found who could make a living by writing them, even in the case of the most successful law-book writers of the present day.

The all-important advantage, however, to the

public will be, that clients will be able to see and consult their solicitor-advocates about their cases. We will give an instance of how matters stand at the present day. A client goes to his solicitor and states his case, for which he is charged a fee; the solicitor then goes to a barrister and has a 'conference' with him, for which a second fee is charged; then, if there is a 'leader' in the case, a 'consultation' is required, and for this a third fee is charged. If the client were enabled to see his advocate direct, one, if not two, of these fees would be saved. Again, before the case comes on for hearing in court, it is necessary for the barrister to be furnished with a full copy of the pleadings, proofs of witnesses, and facts of the case. This constitutes his 'brief,' without which he would be hopelessly at sea. All this means expense, an expense which is often grudged by the client, and which under the fusion would not practically be required. The solicitor-advocate, having gone through the case from its commencement, ought to be in full possession of the facts, and would not require anything for his guidance beyond his own notes whilst arguing the case in court. Of course, if a 'leader' were engaged, a brief would still be necessary; and this luxury would be solely for the client's consideration.

Another result of the change would be that legal partnerships would probably contain many more members than they do at present. The leading firms of London solicitors are usually composed as follows: one partner and his clerks do the Conveyancing work; a second undertakes the Chancery work; whilst a third takes in hand the Common Law. Moreover, there are other special subjects which might require special partners; for instance, Patent, Admiralty, and Ecclesiastical cases, without mentioning more. It will not be very easy to guess which branch of the profession will suffer or gain most by the proposed change: but at all events, the future of a junior barrister is becoming year by year so much less hopeful, that this fact alone will render him less averse to the contemplation of an attack upon his vested interests.

T W I L I G H T.

TO L. L. D.

DREAM-HALLOWED hour! when drifting dusk and shade
Roll from the dying glory of the west;
And shadows woven in the caverned breast
Of yonder beacon, lengthen down the glade!
From beck and mere the mirror'd glories fade;
And mother-souls, secure in fold and nest,
Gather their sleepy murmurers into rest
Of yielded limbs and silence. Dimly arrayed
In dusk and silver of the night, and fair
With lily-stars, the daughter of the day—
Trails of the sunlight in her floating hair,
And tender gleam of reverie, in gray
Of limpid eyes—has borne our fevered care
For one brief hour of dream and shadow-sway.

RANNOCH MEMORIES.

IN the centre of the great Grampian range, and to the north-west of Perthshire, lies Loch Rannoch, a splendid sheet of water, nearly ten miles in length, by one half-mile to a mile in breadth. The river Tummel carries off its surplus waters into the Tay. The village of Kinloch-Rannoch stands at the eastern end. On the north side is the hamlet of Killiechonan; and on the south side, almost opposite, is that of Camgouran. The loch, the Black Wood—a natural pine forest—the birchwoods, the great mountain masses rising in wild confusion, have peculiar charms for a romantic mind. Brawling streams of delightful beauty, broken here and there with what, by a little stretch of imagination, becomes a magnificent cataract, flow wildly down the mountain gorges into the loch. Stretching for twenty miles away to the west is the great expanse of Rannoch Moor, a dreary desolate waste of heather, bog, and loch, traversed by no road, and no house in all its extent.

When a lad of eighteen, my lot cast me into the midst of this wondrous scene. For some time I settled at Camgouran to impart what little store of knowledge I possessed to the children of the servants, crofters, and others on the estate of Dall. About two miles behind the hamlet is one hill which it was my delight to climb, because of the glorious view its summit afforded in the clear morning air. To the south and east, grotesque jagged peaks rise in stern grandeur, overtopped by Ben Lawers, Ben Cruachan, Ben A-chony, Schiehallion, and other neted giants; to the west, the wild rugged hills about Glencoe; to the north, Ben Alder (famous in the wanderings of Prince Charlie) and the Lochaber hills. At the base of Ben Alder the eye catches a glimpse of the southern part of Loch Erich; a little farther to the right is the clear sheen of Loch Garry; and beneath, the pure placid waters of Loch Rannoch are reflecting the grandly wooded hills, and the hamlet of Killiechonan almost opposite. Such scenes as these made so deep and

lasting impressions on my memory, that now, after the lapse of a full quarter of a century, the splendid panorama appears vividly before my eyes.

Camgouran was divided by a burn into Easter and Wester. 'The Burn' was the only name by which I ever heard it called, though its size entitled it to a nobler appellation. By far the greater part of the arable land was in the Wester. This was divided into twelve lots or crofts. The westernmost being made up of several lots whose occupiers had emigrated, was by general consent known as 'The Farm.' The people were in what appeared to me very comfortable circumstances. Almost every crofter had a horse, two or three milch cows, several stirks (young bullocks or heifers), and from one to three score of sheep. These fed in common on the rising grounds behind, and were in charge of a shepherd. Each crofter boarded the shepherd a fixed number of days in succession, and contributed a certain sum towards his yearly wage in proportion to the number of sheep attached to the croft. A similar arrangement was entered into with a boy or girl to take charge of the cows and stirks.

The houses were built of rough stones bedded with clay and pointed with coarse mortar, and were thatched with heather, ferns, or straw. The windows were generally small; very often several of the panes were cracked, and some others patched up with pieces of glass or paper. At one end there was a barn, and a byre for the cows, but completely partitioned off from the dwelling of the family. This had at least always a *but*—the common room where the family cooked and ate their food—and a *ben*, a better-class apartment, kept for the reception of strangers. None of the *buts* had a fireplace or a chimney, in our sense of the word: a raised flat stone at the far end held the blazing peat and birchwood fire; while the smoke escaped by a great open wooden funnel, narrowing towards the top, and surmounted by a barrel-like erection, often bound together with straw ropes. The *ben*

had a fireplace with a grate built in, and a regular chimney up through the gable. In the *ben* were generally placed, end to end along the wall, two box-beds. Here, too, the *caillaich*, or guidwife, expended her taste for ornamentation. A few framed common prints, such as the Queen and Prince Albert, or a number of Scripture scenes, adorned the walls, which were either whitewashed, or so treated as to give the appearance of plaster. A very few had paper-hangings. On the mantel-shelf were arranged one or more coarse china dogs, vases, jugs, and the like. The chairs and tables were all home-made, of native wood. In most cases everything was extremely clean and tidy. In the *but*-end, from the almost constant presence of peat and birch smoke, the wood had assumed the appearance of polished ebony; while the mutton hams dangling from the rafters gave it a somewhat fantastic look.

The home-life was simple. Every morning, porridge and new milk—better than the best Edinburgh cream. The porridge was poured into a big earthenware basin and set on the centre of the *but*-table. A great jug of milk was placed opposite the *caillaich*. Horn spoons and small bowls or jugs for each member of the family were laid down. All sat around. Grace having been said, each received a supply of milk in bowl or jug. Spoons were at once plunged into the mess; then it was who should sup fastest. The slow had a poor chance of a full meal. Dinner consisted of, one day, mutton-kail or broth. A big potful of potatoes was boiled in their jackets to eat with the kail. The boiled mutton came in at the finish. Next day, beaten or whole potatoes, with a plentiful supply of milk and cheese. So on it went, alternating day by day. Roast or stew was never thought of. A few good trout sometimes proved a pleasing variety. Tea was used, to which there was always an abundance of oat-cake, barley-meal and flour scones, and no stint of both fresh and salted butter. 'Loaf-bread,' as it was called—that is, wheaten bread—was a rarity. The Highland Railway was not then opened, and even now the nearest station is Struan, twenty miles off.

It may be interesting to know how the long winter evenings were passed. Two or three logs were laid along the hearth, peats placed against them, and soon there *was* a fire. The guidwife and a few others sat at one side carding and spinning wool. The remaining women were either knitting or sewing. The men were engaged in some sort of work, such as making baskets for carrying peats. Light was supplied as follows, a lamp or candle being used only on special occasions. The natural pine forest had at one time covered a much greater extent of country; the roots, fat and full of resin, still remained in the ground. The *boiteach*, or guidman, had at leisure times during the summer months dug up, with spade and mattock, a quantity of these, carried them home, split them into small pieces (*speilachs*), and placed them to dry. On the left-hand side of the ingle, at a convenient height, was hung up a sort of griddle; several of the *speilachs* were laid on this crosswise above each other. These were kindled, and one person was deputed to keep up the flame

—a duty which required no small amount of skill and attention.

Talk was vigorously carried on; the events of the day were discussed, and plans laid for the future. There was little tittle-tattle, but a good deal of story-telling. In every house it was an understood thing that in my presence, out of courtesy, English alone should be spoken. The stories of spunkies, water-kelpies, spectre-funerals, ghosts, &c., mixed up with wild legend of daring deed or weird romance, were often frightful enough, especially if one had to go home alone any distance in the dark. I remember how, one very dark night, after hearing a ghost recital at a house three miles from my lodging, a feeling of fear and great uneasiness seized me on the way homewards. Two miles of the road ran through the Black Wood, and it *was* black that night. Suddenly I recollected that I had to pass a spot where, a few years before, a pedlar had been found dead, sitting against a tree. He was buried on the spot. What if I should see the pedlar beside that tree, enveloped in phosphorescent light! I knew I was nearing the place. My eyes were straining through the darkness; the sound of my own footsteps alarmed me, and great beads of perspiration were trickling over me. Suddenly, I heard the patter of feet approaching; but I could see nothing. For a moment I stood listening—hesitating. Instantly there was a gentle touch of something cold and moist on the back of my hand. I ran on like a mad creature. The Thing kept pace with me; I could hear it in close pursuit. I rushed along at a great pace. In the midst of my terror I remembered that we kept a tame fallow-deer at the house, which knew me, and followed me like a dog. The animal might have got loose. I stopped suddenly, and, in excited tones, jerked out 'Flora.' She answered by rubbing her cold moist nose against my hand. It took me some time to still the tumultuous beating of my heart; and then I laughed at the idea of being frightened by the touch of a fallow-deer's nose.

The loch afforded excellent fishing, but I took more to the burn. The wild broken chasms with potholes abounding in trout, the sounding waters, the birch and the heather, the excitement born of danger, had more attractions for me than monotonously casting the line from a boat and watching for a fin. The tramp upwards, the bracing morning air, and the general grandeur of the scene, well repaid the exertion, even though there had not been the prospect of a few dozen splendid trout. There was always good sport; I never came back with an empty basket.

One pool I had never attempted to fish. From its high precipitous rocky sides, feathered with birch shrubs and crowned with hoary pines, I deemed it inaccessible. The approach to this gorge was by a kind of stair, composed of broad smooth steps, over which the water leaped merrily, forming a series of beautiful cascades. More than once I had climbed laboriously and waded up to the entrance, where the water, confined in a space not over two yards wide, came boiling furiously from the tempting pot beyond. Approach down stream was impossible. One Saturday, elated with success, I determined to have another look away back into that pot. When I got on to the last step, I began to peer on both sides. I noticed

on my left what looked like a shelf in the rock, running inwards, and disappearing round a corner seven or eight yards in. If I could get on to that shelf, I could easily crawl forward on hands and knees into such a position as would enable me to get at that pot. The rod could be drawn along between my legs; the basket was deposited carefully in a cranny.

Collecting stones, I soon had a pile sufficiently high to allow me to catch the ledge. I pulled myself up. The shelf was wet and slippery, about two feet broad, and afforded good hope of gratifying my ambition. Pressing close to the rocky side, I began to advance slowly and painfully. When about half way, I looked down. I might be about ten feet above the stream. For a moment, the wild, tumultuous eddying and the boiling, furious, rushing waters made me giddy. I closed my eyes to keep out the sight. I would go back. But no! Thus far and baffled! I must have a trout out of that pot, to show as a trophy. Again I advanced. The shelf now narrowed so much that there was barely room for my knees. One false movement, and over I must go, to be mutilated, drowned, and tossed hither and thither. At last, I reached the corner. Right before me was the great dark circular pot, of unknown depth. But my shelf had now become so narrow that to advance was impossible. To attempt to fish was impracticable. The return, I began to feel, was to be perilous. I could gaze on the pot's placid surface, but I dared not ruffle its bosom. A trout leaped up. My heart gave a bound, and I very nearly lost my balance.

The return, however dangerous, must be tried. Down went the rod. Glancing upwards, I saw that the rocks projected over me. I was in a horizontal fissure, whose upper part seemed gradually descending to crush me. My hands and knees were bleeding. I began to try to back out, which I required to do with extreme caution. I found I must move back the knee next the rock before I could move the other, pressing my body at the same time firmly on the side. My joints were getting stiff, and I felt fatigued; but desperation gave me strength. After much slow toilsome effort, I reached the spot where I had ascended. How was I to get down? My hands, elbows, and knees—my whole body—were so sore that to turn off the shelf meant a fall among the stones and a roll into the water, from which, with a few extra bruises—probably broken bones—I felt I would be unable to extricate myself. I gave a shout; and, to my great relief, I immediately heard the well-known voice of the shepherd of the hamlet calling to me from the top of the opposite bank to hold on quietly and steadily, and he would come to my assistance. I knew it would be ten minutes before he could reach me, for he had to go a considerable distance down the stream to get in to the channel, and then climb over the shelves. These ten minutes seemed to prolong themselves to an age. I suppose he lifted me down, for I found myself in a half-sitting posture among the stones, and the shepherd bathing my temples. By-and-by he put his plaid under me, and, taking an end in each hand, he got me on his back and carried me out carefully. When I was laid upon a heathery mound, I presented a sorry appearance, my clothes all soiled and torn, and covered with blood. I soon

recovered so far as to be able to walk a little; and on reaching the peat-road, we fortunately found a cart going for a load of peats. I was lifted in, and the horse's head turned homewards, which, when we reached, all sorts of wild rumours were sent abroad. I was confined to bed for a week. The rod and basket were afterwards delivered to me by the good shepherd, who had gone to the spot in search of them.

THIS MORTAL COIL.

CHAPTER XXXII.—ON TRIAL.

MATTERS at Whitestrand had been going meanwhile from bad to worse. Winifred never spoke another word to Hugh about Elsie's watch; her pride prevented her. She would not stoop to demand an explanation. And Hugh had no explanation of his own to volunteer. No ready lie rose spontaneous to his lips. He dropped the subject then and for ever.

But the question of the encroachments could not be quite so cavalierly dropped: it pressed itself insidiously and silently upon Hugh's attention. An eminent engineer came down from London to inspect the sand-drifts, shortly after Hatherley's visit. He stroked his chin and remarked cheerfully with a demonstrative smile that currents were very ticklish things to deal with on their own ground: that when you interfered with the natural course of a current, you never could tell which way it would go next; and that diverting it was much like taking a leap in the dark, as far as probable consequences to the shore were concerned. After which reassuring vaticinations, the eminent engineer proceeded at once with perfect confidence to erect an expensive and ingenious breakwater off the site of the poplar, which strained the slender balloon of Hugh's remaining credit to the very verge of its utmost bursting-point. A year passed by in the work of building and throwing out the breakwater; and as soon as it was finished, with much acclamation, a scour set in just round its sides which ate away the grounds behind even faster than ever.

The estate, in fact, was simply doomed. Æolian, Pactolian, indeed: ah me, the irony of it! Those Æolian sands were overwhelming Whitestrand. The poplar had formed its one frail support. In destroying the poplar, Hugh had simply outwitted himself. No earthly science could now repair that fatal step. Physicians were in vain. Engineers and breakwaters were of no avail. The cruel crawling sea had begun remorselessly to claim its own, and day after day it claimed it piecemeal.

Nor was that all. Hugh's affairs were getting more and more involved in other ways also. Those were the days of the decline of Squiredom. Agricultural depression had told upon the rents. Turnips were a failure; mangolds were feeble; Hessian fly had made waste straw of old Grimes's wheat-crops; barley had never done so badly for years. Foot-and-mouth disease and pleuro-pneumonia had combined with American competition and Australian mutton to lower prices and to starve landlords. Rents came in worse and worse at each successive Whitestrand audit. The interest on the mortgage was hard to raise; and the servants' wages at the Hall, it was whispered about, had fallen into arrears for a whole quarter.

Clearly the young Squire must be short of funds ; and nothing was afloat to help his exchequer into safer waters.

But drowning men cling to the proverbial straw. For his own part, Hugh had high hopes at first of his *Life's Philosophy*. He had trimmed his little bark most cunningly, he thought, to tempt the stormy sea of popular approbation. There was the big long poem for heavy ballast, and the ballades and occasional pieces in his lightest vein for cork belts to redress the balance. Sooner or later the world must surely catch glimpses of the truth, that it still enclosed a great unknown Poet ! He waited for the storm of applause to begin ; the critics would doubtless soon set up their concerted pean. But one day, a few weeks after the volume was published, he took up a copy of the *Bystander*, that most superior review—the special organ of his own special clique—and read in it with hushed breath—a hostile notice of his new and hopeful volume. His heart sank as he read and read. Line after line, the sickening sense of failure deepened upon him. It had not been so in the old days ; then, the critics had hastened to bring him butter in a lordly dish. But now, all that was utterly changed. He read with a cheek flushed with indignation. At last, the review touched bottom.

‘Mr Massinger,’ said his critic in concluding his notice, ‘has long since retired, we all know, into Lowther Arcadia. There, among the mimic ranges of the Suffolk sandhills—a doll’s paradise of dale and mountain—he has betaken himself with his pretty little pipe to the green side of a pretty little knoll, and has tuned his throat to a pretty little lay, all about a series of pretty little ladies, of the usual insipid Lowther-Arcadian style of beauty. These waxen-faced damsels somehow fail to interest us. Their cheeks are all most becomingly red ; their eyes are all most liquidly blue ; their locks are all of the yellowest ; and their philosophy is a cheap and ineffective mixture of the *Elegant Extracts* with the choicest old crusted English morals of immemorial proverbial wisdom. In short, they are unfortunately stuffed with sawdust. The long poem which gives a title to the volume, on the other hand, though molluscoid in its flabbiness, is as ambitious as it is feeble, and as dull as it is involved. Here, for example, selected from some five hundred equally inflated stanzas, are the modest views Mr Massinger now holds on his own position in the material Cosmos : the scene, we ought to explain, is laid in Oxford ; the time, midnight or a little later ; and the Bard speaks in *propria persona*.

The city lies below me wrapped in slumber :

Mute and unmoved in all her streets she lies :

Mid rapid thoughts that throng me without number

Flashes the phantom of an old surmise.

Her hopes and fears and griefs are all suspended :

Ten thousand souls throughout her precincts take

Sleep, in whose bosom life and death are blended,

And I alone awake.

Am I alone the solitary centre

Of all the seeming universe around,

With mocking senses, through whose portals enter

Unmeaning phantasies of sight and sound ?

Are all the countless minds wherewith I people

The empty forms that float before my eyes

Vain as the cloud that girds the distant steeple

With snowy canopies ?

Yet though the world be but myself unfolded—

Soul bent again on soul in mystic play—

No less each sense and thought and act is moulded

By dead necessities I may not sway.

Some mightier power against my will can move me :

Some potent nothing force and overawe :

Though I be all that is, I feel above me

The godhead of blind law !

‘Seven or eight pages of this hysterical, cartilaginous, invertebrate nonsense have failed to convince us that Mr Massinger is really, as he seems implicitly to believe, the hub of the universe, and the sole intelligent or sentient being within the entire circle of organic creation. Many other poets, indeed, have thought the same, but few have been so candid as to express their opinion.’

Hugh crushed the *Bystander* in his hand with a burning sense of wrong and indignation. The measure he himself had often meted to others, therewithal had it been meted to him ; and he realised now in his own person the bitterness of the stings he had often inflicted out of pure wantonness on endless young and anonymous authors. Cheyne Row had clearly cast off her recalcitrant son. He was to it now an outcast and a pariah, a wicked deserter to the camp of the Philistines.

Winifred was seated on the sofa opposite, but he did not pass the paper to her. He flung it from him. He was too vain to ask for her sympathy ; and perhaps he was not quite sure that he had any claim upon it. They were leading a life of mutual avoidance, as far as possible ; communicating only on strictly practical topics, when occasion demanded, and not even then in the most amicable spirit. They were not in touch with each other ; but who was to blame ? Not surely Hugh—the wise, the brilliant, the immaculate ! And yet—and yet—how little he understood a woman’s heart. While he had been reading in bitterness of spirit what the *Bystander* said of him, Winifred was also reading—in the *Charing Cross Review*, and the subject was that same volume of her husband’s. The criticism here was ten times more galling and bitter than that under which Massinger had just been wincing, and she knew how it would pain him were he to read it. Had she been as heartless as her husband, she would have passed the paper to him and enjoyed his humiliation and discomfiture. But she was not as her husband was—in many ways. She was as many another woman, with a proud and selfish and unsympathetic husband, has been. She had loved him once, and in a measure loved him still, and therefore would not pain him by inflicting another wound, as it were, with her own hand. She buried the paper deep beneath the sofa cushions ; and Hugh never knew the bitter things which the *Charing Cross Review* had said about him. It would have been all the more galling to his wounded spirit had he known further that that review was signed with the initials A. H.—Arthur Hatherley.

Winifred lifted the paper which Hugh had flung from him, and skimmed the *Bystander* review in haste. But she said never a word in any way about it. ‘Shall I accept Lady Mortmayne’s invitation ?’ she asked with chilly unconcern.

Bohemia had clearly turned against them ; but

Philistia at least, Philistia was left to console their bosoms. If one can't be a poet, one can at any rate be a snob. In the bitterness of his heart, Hugh answered: 'Yes. Go anywhere on earth to a body with a handle.' Then he tried to rouse himself, to put on a cheerful and unconcerned manner. 'I like to patronise art,' he went on with a hard smile, 'and as a work of art I consider Lady Mortmayne almost perfect.'

Winifred laid down her paper on the table. 'What shall I say to her?' she asked glassily. She was a timid letter-writer. Even since their estrangement, Hugh most often dictated her society notes for her.

'Dear Lady Mortmayne, we shall have great pleasure'—Hugh began with vigour.

'Isn't "we have great pleasure" better English, Hugh?' Winifred asked quietly, as she examined her nib with close attention.

'No,' Hugh blurted back; 'certainly not. Shall have great pleasure's quite good enough for me, so I suppose it's good enough for you too; isn't it?' He was getting positively cruel now. 'If you can write so well,' he muttered between his clenched teeth, 'write it yourself. "Great pleasure in accepting your kind invitation for Thursday next."'

'Thanks. I think I'll put it my own way. "And will bring the dahlias she promised"'

'Who promised?—Lady Mortmayne?'

'Oh, bother! I mean, "the dahlias I promised, which I would have brought before; but I was unfortunately prevented by my gardener having quite inadvertently"'

'For Heaven's sake, split it up into short sentences,' Hugh cried, on tenter-hooks. 'I couldn't let such a note as that go out of my house—I mean, our house, Winifred—if my life depended upon it. A man of letters allow his wife to make such an exhibition of impossible English!'

'I wish I was clever,' Winifred said, growing red, 'and then I could write my own letters without you.'

'Be good, my child, and let who will be clever.' 'Charles Kingsley,' Hugh answered provokingly. '"An honest man's the noblest work of God." Alexander Pope. (I think it was Pope; or was it Sam Johnson?) A placid woman runs him close, ecod: Hugh Massinger. Ecod's a powerful weak rhyme, I admit, but what can you expect from a mere impromptu? I only wish all women were placid. Well, the moral of these three immortal lines, selected from the works of three poets in three different ages born (Dryden), is simply this—you do very well as you are, Winifred. Don't seek to be clever. It doesn't suit you. Take my advice. Leave it alone.—For if you do, you'll find it in the end a complete failure.'

'Hugh! You insult me.'

'Very well then, my dear. You will be able to exercise Christian patience and resignation in pocketing the insult—as I have to do from you very often.'

Winifred shut down her writing-case with a bang and burst, not into tears, but into an uncontrollable fit of violent coughing. She coughed and coughed till her face was purple and livid with the effort. Hugh watched her silently, as hard as adamant. She had often coughed this way of late. The habit was growing on her.

Hugh thought she ought to cure herself of it.

'I shall go up next week again to consult Sir Anthony Wraxall,' she said at last, when she recovered her breath, gasping and choking. 'Will you go with me, Hugh?'

'We've no cash now to waste on junketing and gadding about in town,' Hugh answered gloomily. 'A pretty time to talk about riotous living, with the servants' wages all overdue, and duns bothering at the door for their wretched money! My presence could hardly give you any appreciable pleasure. You can stop at the dingy old lodgings in Albert Row, and Mrs Bouverie Barton will help gad about with you. You can traipes together over half London.'

Winifred bowed her poor head down in silence. Her heart was sick. It was full to bursting. This was all she had bought with the fee-simple of Whitestrand.

CHAPTER XXXIII.—AN ARTISTIC EVENT.

'Mr Warren Relf,' said the daintily etched invitation card, 'requests the pleasure of a visit from Mr and Mrs Bouverie Barton and friends to a Private View of his Paintings and Water-colour Sketches, on Saturday, October the 3d, from 2.30 to 6 p.m., at 128 Bletchingley Road, South Kensington.'

Such a graceful little invitation card never was seen, neatly designed by the artist himself, with a bold flight of sea-gulls engaged in winging their way across the upper left-hand corner; and a stretch of stormy waves bestridden by a fishing-smack in full career before the brisk breeze occupying the larger part of its broad face in very delicate and exquisite outline. When Winifred Massinger saw it carelessly stuck aside among a heap of others on Mrs Bouverie Barton's occasional table in South Audley Street, she took it up with a start and examined it closely. 'Mr Warren Relf!' she cried, in a tone of some surprise. 'Then you know him, Mrs Barton? I didn't remember he was one of your circle. But there, of course you know everybody.—What a sweet little etching!'

'What? Mr Warren Relf?—O yes, I know him. Not, I'm afraid, a very successful artist, as yet; but they say he has merit—in his own way, merit. I'm going to see these new pictures of his on Saturday, if I can sandwich him in edgewise between the Society for the Higher Education of Women and the Richter concert or tea at the MacKinnons'. I've only five engagements for Saturday. Quite an empty day.—Have you got a card for the private view yourself, dear?'

'No,' Winifred answered with a slight blush.

'Well, then, would you like to go with us, dear?' Mrs Bouverie Barton asked kindly.

Winifred turned over the card with a wistful look. 'It says, "Mr and Mrs Bouverie Barton and friends,"' she repeated with emphasis. 'So of course you can take whoever you like with you, can't you, Mrs Barton?—Saturday the 3d from 2.30 to 6 p.m.—I think I might.—I'll risk it anyhow.—That'd suit me admirably. My appointment with Sir Anthony's for two precisely.'

'Your appointment with Sir Anthony?' Mrs Barton echoed in a grieved undertone.

Winifred coughed—such a nasty dry little hacking cough. 'Why, yes, Sir Anthony Wraxall,' she answered, checking herself with some difficulty from a brief paroxysm of her usual trouble. 'I've come up this week, in fact, on purpose to consult him. Hugh made me come, my lungs have been so awfully odd lately.'

'My dear,' Mrs Bouverie Barton put in tenderly—everybody knows Mrs Bouverie Barton, the most charming and sympathetic hostess in literary London—'you hardly seem fit to go running about town sight-seeing at present.—Does Mr Massinger seriously realise how extremely weak and ill you are?—It scarcely seems to me you ought to be troubling your poor little head about private views or anything of the sort with a cough like that upon you.'

'Oh, it isn't much, I assure you, dear Mrs Barton,' Winifred answered, the tears coming up into her eyes as she spoke at the touch of sympathy. 'Hugh doesn't think it's at all serious.'

At 128 Bletchingley Road, the ancestral home of all the Relfs—for one generation—a tiny eight-roomed London house in a side-street of intense South Kensington—all was bustle and flutter and feverish excitement. Edie Relf to-day was absolutely in her element. It was her joy in life, indeed, to compass the Impossible. And the Impossible now stared her frankly in the face in the concrete shape of a geometrical absurdity. She had undertaken to make the less contain the greater, all the axioms of Euclid to the contrary notwithstanding. What are space and time to a clever woman? Of no more importance in her scheme of things than to Emmanuel Kant or to Shadworth Hodgson. The Relfs had issued no fewer than three hundred and twenty separate invitation cards, each with that extensible india-rubber clause, 'and friends,' so capable of indefinite and incalculable expansion. Now, the little front drawing-room at Bletchingley Road could just be induced, when the furniture was abolished by Act of Parliament, and the piano removed up-stairs to the back bedroom, to accommodate at a pinch some thirty-five persons, mostly chairless. 'My dear Edie,' Mrs Relf cried in a voice of despair, 'we can never, never, never pack them in anyhow.'

'Herrings in a box would find themselves comparatively roomy and comfortable,' Warren murmured, with a glance of black despondency round the four scanty walls of the tiny drawing-room. 'How on earth could you ever think of asking so many?'

'Nonsense, my dears!' Edie answered with a confident smile that presaged victory. 'Leave that to me. It's my proper business. I see it all. The commanding officer should never be hampered by futile predictions of defeat and dishonour. Of course they won't come, the greater part of them. They never do rush, I regret to say, to inspect your immortal works, Warren. But still we must arrange, for all that, as if we expected the whole united British people—in case of a rush, don't you know, mother. Let me see. We've only sent out cards, I think, for a poor trifles of three hundred and twenty.'

'No,' Warren corrected very gravely. 'Three

hundred and twenty cards, you mean, for six hundred and forty wives and husbands.'

'Some of them are bachelors, my dear,' Edie answered with a sagacious nod; 'and some old maids, who never by any chance buy anything. And what's two hundred? A mere trifle! I declare it affords no scope at all for a girl's ingenuity. Like our respected ancestor, Warren Hastings, I stand aghast at my own moderation.—I really wish, mother, now I come to think of it, we'd sent out invitations for a thousand.'

'Six hundred's quite enough for me, I'm sure,' Warren replied, glancing round the room once more in palpable doubt. 'How do you mean to arrange for them, Edie?'

'Oh, easy enough. Nothing could be simpler. I'll tell you how. First of all, you throw open the folding-doors—or rather, to save the room at the sides, you lift them bodily off their hinges, and stick them out of the dining-room window into the back garden.'

'They won't go through,' Warren objected, measuring with his eye.

'Rubbish, my dear! Won't go through, indeed! You men have no imagination and no invention. You manufacture difficulties out of pure obstructiveness. If they won't go through whole, why, just take out the panels and unglue the wood-work, that's all.—Very well, then; that throws the drawing-room and dining-room into one good big reception-room, from which of course we remove all the furniture. Next, we range the chairs in a long row round the sides for the old ladies—the old ladies are very important; keep 'em down-stairs, or else they'll prevent their husbands from buying—and let the men and the able-bodied girls stand up and group themselves in picturesque clusters here and there about the vacant centre. What could be easier, simpler, or more effective? A room treated so furnishes itself automatically with human properties. With tact and care, we could easily squeeze in some seventy or eighty.'

'We could,' Warren answered, after a mental calculation of square area.—'But how about the pictures?'

'Hear him, mother! Oh, but men are helpless! Where should the pictures be but up in the studio, stupid! We wouldn't take all the people up to see them at once, of course. You and I would go around, looking very affable, with a professional smile—so, you know—perpetually playing about the corners of our mouths, and carry off the men with the most purchasing faces in constant relays up to admire the immortal master-pieces. Meanwhile, mother and Mr Hatherley, down below here, would do the polite to the old ladies and undertake the deportment business. Or perhaps Mr Hatherley'd better be stationed on guard up-stairs, to fire off some of his gushing critical remarks from time to time about the aerial perspective and the middle distances. Mr Hatherley always knows just what to say to weigh down the balance for a hesitating purchaser.'

'Edie,' Warren cried, flinging himself down with a disgusted face upon the dining-room sofa, 'I hate all this horrid advertising and touting, for all the world as if one were the catchpenny proprietor of a patent medicine, instead of an honest hard-working British artist!'

'I know you do, my dear boy,' Edie answered imperturbably; 'and that's all the more reason why those who have the charge of you should undertake to push you and tout for you against your will, till they positively make you achieve the success you yourself will never have the meanness to try for.—But, thank goodness, I don't mind puffing. I'm intriguer enough myself for the whole family. If it hadn't been for my egging you on, and pestering you and bullying you and keeping you up to it, we should never have got up this private view of your things at all.—And now, having started and arranged the entire show, I mean to work it my own way without interference. If there's anything on earth I love, it's a jolly good muddle.'

And jolly as the muddle undoubtedly was, Edie Relf did pull them through in the end with triumphant strategy. Saturday the 3d was a brilliant success. Blotchingley Road, that mere suburban byway, had never before in its checkered career beheld so many real live carriages together. The six hundred, or at least a very fair proportion of them, boldly they drove and well, down that narrow side street. All the world wondered. The neighbours looked on and admired with vicarious pride. They felt themselves raised in the social scale by their close proximity to so fashionable a gathering. Number 128 itself was a changed character; it hardly knew its own ground-plan. Edie alone had reigned supreme. And as two of the clock chimed from Kensington church tower on that eventful afternoon, she murmured aside to her mother, with an enraptured gaze at the scarlet and green *kakemonos* on the wall of the staircase: 'My dear, there's not a speck of dust in this house, nor a bone in my body that isn't aching.'

FIGHTING THE ARABS AT LAKE NYASSA.

BY ALFRED SHARPE.

On the 2d of November 1887 I left Bandawé on the western shore of Lake Nyassa, on an elephant-hunting trip through the hills to the west. I reached the Kafusi River that night, and camped on the bank of the stream some twenty-five miles from Bandawé. I had intended to have followed up the valley of the Kafusi to the north-west, where elephants are always to be met with; but on the following morning at daylight, as we were on the point of starting, we heard distant shouts in the bush, and presently in ran two natives, who had been sent after us with letters from Bandawé. It appeared that after our departure, the little steamer *Ilala*, which runs up Lake Nyassa about once a month, had arrived, having on board three Europeans—E. O'Neill (the British consul at Mozambique), Dr Tomory of the London (Medical) Missionary Society, and Mr Scott. They were on their way up to the north end of the lake, to the assistance of two Europeans at Karonga (one of the African Lakes Company's stations) who were being threatened with attack by the Arabs.

I returned to Bandawé, therefore, and we all left in the steamer for Karonga, having with us some twelve natives and fifteen guns of various kinds. Steaming throughout the night, we stopped

for a few hours on the following day, at a wooding-place in Deep Bay, and reached Karonga after dark the same evening. We were glad to find that the two Europeans were safe and well—Bain of the Scotch Free Church Mission; and Monteith, the agent of the African Lakes Company in charge of the station. Their news was, however, very bad. The Arabs, some five hundred in number, had been ravaging the country round, killing the natives, burning their villages, making slaves, and in fact depopulating the whole district about Karonga. On the day before our arrival, the Arabs had gone to the Cambwé lagoon, where many natives had taken refuge, hiding in the reeds about the lagoon. They set the reeds on fire and shot the natives as they ran out. Some were roasted; and some, who jumped into the lagoon, were taken by the crocodiles.

The Arabs had threatened to take possession of the station at Karonga; and Monteith and Bain expecting an attack daily, had built a small fort of unburnt bricks on the edge of the lake, some eighty yards from the station, to which they intended to go in case of attack.

We sent the steamer back on the day after our arrival, instructing her skipper to hurry to the south end of the lake and bring back men, guns, and ammunition with all speed; and we expected her back in six or seven days. (As it turned out, however, eventually, she did not get back for five weeks.)

A few days after our arrival, Nicol, one of the African Lakes Company's employees, arrived from Tanganyika, where he had been absent for some months. This increased our force considerably, as he brought with him some more men and guns. We now had some forty guns of all kinds, but only a few hundred rounds of ammunition. Among our guns were flint-locks, Tower muskets, shot-guns, elephant-guns, express rifles, Sniders, and Martinis. And there was one enormous two-bore muzzle-loader: this, however, no one cared to fire.

On November 7th, seventy to eighty natives came in and asked for protection, and we allowed them to occupy some empty sheds in the station. And on the 19th, many hundred natives, of whom a large proportion were women, were taken into our camp for protection.

We were busy now strengthening the brick fort. It was a space about twenty yards square, on the edge of the lake, surrounded by a wall of unburnt bricks about four feet six inches to five feet high, and two feet thick. Outside this we dug a shallow wide trench, which we filled in with thorns. We also enclosed a piece of the sandy beach behind our fort with a wooden stockade for the refugees, cattle, and donkeys.

On the 18th, we received word that the Arabs were preparing to attack us; and we then moved the ivory from the store and all valuable goods into the fort. We put up three tents inside, enclosed the refugees and animals in the stockade behind us, and took up our abode in the fort, leaving the old store and station empty, as it would have been impossible to defend the houses against attack.

There were four Arab towns near Karonga: Maramba (two miles south), Kopakopa (sixteen miles south), Sulema (seven miles west), and Mpata (sixteen miles west). The Arabs from

these four towns had concentrated at Maramba. On the 23d, while at breakfast in the fort, we heard shots fired, and saw the Arabs in the bush some three hundred yards south of us; but after some ten minutes' firing they retired. On this day we sent Nicol to the north end of the lake, to the Sokili chiefs, asking them to come down in force to our assistance. On the 24th, at daylight, the whole Arab force, numbering some five hundred guns, attacked us. They were also assisted by a tribe of Wahenga natives from the town of Kanyolé, who had thrown in their lot with the Arabs. They came on apparently intending to 'rush' our fort, but never got within eighty yards of us, our fire driving them back to the trees. They then entered the empty station and fired from behind the houses, trees, &c.

I now give extracts from my diary for the next five days:

'24th.—Before noon, the Arabs had learnt not to expose themselves to our fire. We saw several shot, but cannot tell the extent of their casualties. Ours were, a donkey killed and a woman (a refugee) wounded in the cheek. In the afternoon the Arabs occupied the empty store and used it as a fort, knocking out loopholes. Firing all day. Our greatest anxiety is that we are so short of ammunition. We have stopped the boys from firing; whites only firing, picking off any of the Arabs who show themselves.

'25th.—Firing kept up by Arabs all night. During the darkness, they have built a stockade of thick tree-trunks one hundred and eighty yards south of us on the beach, and from there and the store they pour a nasty cross-fire into our fort. All our tents have bullet-holes. Firing all day. Rain in morning makes things uncomfortable for us. Unless the steamer or the Sokili people come soon, we shall be in a bad way. During the morning, seeing that a large number of Arabs were running into the store to get out of the rain, we took two of the eight-bore elephant guns which carried a three-ounce bullet and ten drams of powder, and fired for the strong door. The bullets must have penetrated and done some execution, as we saw the Arabs pouring out again.

'26th.—Rain all night—everything wet. Arabs firing all through last night. They have now started another stockade of horizontal logs, which they are building up into some large trees one hundred and fifty yards south of us. Firing all day, many bullets in the tents. In the evening sent out a party to try to fire the store, we in the fort keeping up meanwhile a heavy fire. The boys were successful, and the store was burnt down.

'27th.—Firing all day. In the afternoon, the Arabs opened fire from their new stockade, fully thirty feet from the ground: they are thus enabled to fire down into the fort. No longer safe to walk about in the fort. Had to dig ditches two feet deep all about, to walk in. Also heightened the walls by piling bales of cloth on the top.

'28th.—Early this morning the Arabs ceased firing. We sallied out, and in a few hours pulled down their stockades. About noon we were delighted to see large numbers of the Sokili natives coming down the lake shore to our assistance—fully four thousand of them.'

On the following day, together with our native allies, we went for the Arab town of Maramba,

and rushing the stockade, found the town empty, the Arabs having hurriedly deserted it, and gone to Mpata, to resist us there if we attacked them. We burnt the town, and tried to induce our native allies to go with us to Mpata; but they would not, saying they wished to return home now. We therefore returned with them to their own country, and camped at Nsesi, some thirty miles north of the old station, intending to await here the arrival of the steamer with ammunition and reinforcements, and then to attack Mpata.

On the 4th of December we attacked and destroyed the native town of Kanyolé, whose people had been with the Arabs fighting against us.

While awaiting the arrival of the steamer, I took a short journey to the foot of the Livingstone range of mountains. They rise straight from the shore of the lake on the north-east shore, and at the north end of the lake curve round to the north-west, having the large plain inhabited by the Sokili tribes at their base. Elephants are plentiful in the wooded foothills; and in the plain itself are immense quantities of buffalo. On my first day I shot three elephants out of one herd; and on the 14th of December I shot two more, one of which had tusks weighing nearly sixty pounds each. On the 15th of December I shot three, one of which had only one tusk. On the 16th I received letters from the camp at Nsesi telling me that the steamer had arrived bringing a few more guns and men, and a few hundred cartridges and four Europeans, and that it was arranged we should attack Mpata at once. Among the arrivals were Hawes, the British consul for Nyassa; and J. Moir, the manager of the African Lakes Company. I returned to the camp; and on the 22d we started for Mpata with one hundred guns of all descriptions, and a large native contingent armed with spears. We reached Mpata on the morning of the 23d, and found the Arabs in great force, and the town strongly stockaded. The Arabs were outside the town; but as we advanced, they retired inside and fired from behind their stockade. Where we had hoped our native allies would be of most use to us, was in the taking of the stockade. We had hoped they would advance up with us, and by climbing over in their overwhelming numbers, have overpowered the Arabs; but they showed the white-feather, and utterly failed us, hung back, and could not be induced to advance right up; so we had to go on without them. Luckily, as soon as we reached the stockade itself and put our guns through, the Arabs fled back into the town, and then our natives came up and swarmed over. For an hour or two we had a lively time. Our natives were bent solely on looting, and would not join with us and drive the Arabs out of the far end of the town; consequently, a desultory fight was kept up all the time among the houses. Eventually, we set fire to our end of the town, and started back for Nsesi—the natives having secured ivory and cloth to the value of some eight hundred pounds, as well as guns, powder, and numerous other things. Our casualties were two Europeans wounded, several of our native allies wounded and several killed. The Arab loss must have been heavy compared with our own.

On the 5th of January, seven of us Europeans left in the *Ilala* for the south end of the lake;

and I went on from there, down the Shiré, Zambesi, and Kwakwa rivers to Quillimane, which port I reached on the 28th of January.

I see, from recent English papers, that in answer to a question asked in the House of Commons on the 28th of February, Sir J. Ferguson stated that no assistance could be given by government to the British subjects settled at Nyassa. This leaves them in a somewhat awkward position, as the British consul for Nyassa has positively forbidden the African Lakes Company to take matters into their own hands and to protect their own interests in their own way. They are therefore told that the English government will not help them, nor are they to help themselves. Surely one course or the other should be taken by our government—either to help the British subjects at Nyassa, or else to leave them alone to help themselves in such way as they think best.

There are, moreover, other interests to be considered in this matter as well as those of the African Lakes Company and the missions and traders. It is quite certain, unless the Arabs at the north end of Nyassa are driven out or kept in proper control, that the route viâ Nyassa to Tanganyika will be permanently closed by them. Sufficient attention has not been given to this route to Central Africa, which is, I think there can be no doubt, the quickest and the safest. I travelled from the north end of Nyassa to the coast (at Quillimane) in twenty-three days, the whole of this, except sixty miles, being by water. The journey from Nyassa to Tanganyika takes twenty days, and the country all through is healthy, and natives quiet and friendly. Tanganyika can be traversed from south to north in eight days by the steamer now on the lake belonging to the London Missionary Society; and the north end of Tanganyika is only some two hundred and eighty miles from the Albert Nyanza.

There is also the slave-trade question. At the present time, a large and increasing slave-trade is being carried on by the Arabs in the districts west and north of Lake Nyassa; and nearly the whole of the slaves procured in those regions are taken across the lake in Arab dhows and canoes, and down to the sea-coast. The Arabs are anxious to have the north end of Nyassa entirely in their own hands, as it is a convenient depot for caravans from the west, and a good starting-point for the journey to the sea-coast. This route to the coast (Nyassa to Kilwa) is a far easier and shorter journey for them than the old routes from Tanganyika to Zanzibar.

THE SILVER STREAM.

AN IDYL OF THE WYE.

IN FOUR CHAPTERS.—CHAP. II.

SOME men are naturally homely; others more prone to a wandering life, and Colonel Scobell was one of the latter. He had a great predilection for 'camping out,' to use his own term, which in his case invariably meant taking a cosy country-house for the summer months and immediately asking all of his acquaintances to fill it. As the Colonel's good-nature was only exceeded by his thoughtlessness, and that is saying a great deal,

complications and confusions were by no means a rarity. But blessed with a good wife who understood his little weaknesses, these contretemps usually ended happily.

Pencraig was a beautiful old house, of semi-Elizabethan architecture, with plenty of large airy apartments, and an unknown quantity of bedrooms. As the three voyagers stood upon the terrace, they caught a glimpse of light draperies, and heard the ripple of girlish laughter from a shady tennis lawn. The Colonel led the way into a cool dim drawing-room, where they found Mrs Scobell deep in the delightful chronicles of *Little Lord Fauntleroy*.

'I have brought you some more visitors, Belle,' cried the Colonel. 'A most fortunate thing I was down on the Rock Cottage streams as they went by. Fancy not knowing we were in the neighbourhood!'

Mrs Scobell, a rosy plump little lady, who had been a beauty in her time, before a sturdy harum-scarum family had come to be the joint plague and joy of her life, shook hands heartily. And she was not the least less pleased to see her visitors, despite the fact that she hadn't the smallest idea how they were going to be accommodated.

'Thank goodness it is no worse,' she said. 'Oh, of course I don't mean that, you know, only the Colonel is so inconsiderate. It is only last week that he went off fishing below Ross and brought back no fewer than five with him, not one of whom he had seen before. Of course, it seems very inhospitable, but I had to put two in the billiard-room.'

'That Scotch fellow could tie a fly, though,' the Colonel observed reflectively. 'He had a way of dressing "hackles" I never saw before.'

'And that covers a multitude of sins,' said Denton, with a laugh.—'But you can make yourself easy about that, Mrs Scobell. I need not ask if you have a houseful. Any one here we know?'

'I expect so. There is Miss Rashleigh and her brother; the Moffat girls—five of them; and in fact several others. We are very short of gentlemen.'

'Oh, come now,' the Colonel remonstrated. 'There are young Rashleigh and myself, with our three friends here, to say nothing of Du Maurier.'

Denton shot a significant glance at Bertie, who looked in his turn towards Decie. Beyond a quick flush of colour in his cheeks and a mechanical clenching of the right hand, he betrayed no sign. It was a relief to the awkward silence when the luncheon bell rang.

'We are in luck,' said Denton grimly, when the trio were changing in the privacy of their apartment—a large room with three beds set apart for bachelors and such erratic visitors. 'Rashleigh and Du Maurier! The Colonel isn't a gambling man, Phil, I apprehend?'

'About the last man in the world to amuse himself that way.—You are wondering what brings Du Maurier down here. No good, you may be certain.'

In the dining-room the ample table was laid for eighteen, though that unconventional, but none the less cosy meal, luncheon, as interpreted in a country house, was apparently anything but well patronised. The Colonel liked to see his

young friends enjoying themselves, and so long as dinner was not delayed, they could drop in or out from luncheon as the spirit moved them. A group of merry maidens, clad in flannel tennis costumes and striped jackets, and carrying the warmth and excitement of the fascinating game in their flushed faces, stood chattering before the cool fern-decked fireplace as Denton with his gallant crew entered.

'My prayer has been answered,' cried the tallest of the group, a dark vivacious-looking girl, rejoicing in the name of Gwendolyn Moffat. 'I have prayed for some boating-men, and they have come.—Mr Trevor, I have been here more than a fortnight and never on the river once. And till I came here I was getting on splendidly with my sculling.'

'Let's have a look at your knuckles,' said Bertie; 'that will soon show.'

Miss Gwen held out a long white hand pure and stainless as marble. But the light blue 'four,' not being gifted with a sculptor's admiration of the beautiful, eyed the slim fingers critically and from a purely athletic point of view.

'Oh, we'll soon alter that,' he said cheerfully. —'Don't you remember what a state they were in last Easter after a fortnight's coaching?—Come with me after luncheon. We've got the old gig and a famous pair of skulls.'

Denton, cynic as he was, found himself in the toils of a sister siren ambitious of aquatic honours, and in a few moments was making arrangements for forming an amateur 'pair,' under the watchful eye of himself and Bertie Trevor, with all the eagerness of a schoolboy. So busily engaged were they, that no notice was taken of the advent of a new-comer, another girl in tennis costume. But Phil saw, and turned a little paler as his eyes encountered hers. She came towards the gay group almost reluctantly. Decie bowed low, to hide the flush of colour that would rise to his cheek. As she turned away, standing by one of the open windows, he crossed over to her.

Her fair sweet face was hidden from him, but she seemed to feel his presence. 'Why did you come?' she asked, still gazing fixedly at the landscape.

'I could not help myself.—No; do not misunderstand me. I am not paying you an idle compliment. The simple truth is that I did not know you were here. I will keep out of your sight as much as possible.'

Beatrice Rashleigh made no reply for a moment; her face was very white and set, had he but seen it; but Phil was not looking in her direction, for the simple reason that he was afraid to do so. 'There is room enough here for both of us,' she said. 'Still, it would be ridiculous to attract attention. Outwardly at least we can be friends. I hope I have made my meaning plain enough?' The words were very cold, though Decie could not guess what a violent effort they cost the speaker. His mind was too full of bitterness and despair to comprehend the feelings of another.

'Perfectly plain,' he replied. 'You may rest assured that I shall not trouble you with my company. Still, we had better have a complete arrangement. If you can spare me a few moments presently, I shall be grateful.'

'It shall be as you wish; but only this once, understand.'

Miss Rashleigh quitted her position and took a seat at the table. There was a vacant chair by her side, into which a late comer presently glided. He was a young-old man, to coin an expression—young in air and manner, and in the lower part of his face, which was ornamented by an elaborately waxed moustache; though his narrow receding forehead was lined and wrinkled, and his densely black hair was growing somewhat thin—the only sign by which, said Denton, Horace Du Maurier showed his fast life and dissipated habits.

Decie experienced an inward spasm of relief, curiously mingled with pain, as Beatrice rose from her seat and disappeared. He did not, however, view with corresponding equanimity the speedy exit of the fascinating Horace, or the little smile of meaning telegraphed from face to face with that instinctive freemasonry, the secret of which is known only to the gentler sex.

'I don't like that man,' Edith Moffat murmured, for Phil's ear alone. She was the youngest of the family, only just out, and an old friend and favourite of Decie's. 'What can Beatrice be thinking about?'

'Oh, there is something between them, is there?' asked Phil coolly. They were quite alone by this time. Down the winding path towards the river, Denton and Trevor were just disappearing from view, accompanied by the fair crew, for a long lazy afternoon on the water. 'How long has it been going on?'

'Before we came here—when we were in town, I imagine. I can't think what has come to Beatrice. And I am certain Mr Du Maurier is not a gentleman. However, it has nothing to do with me—it is *some one else's* business.—When are you going to teach me that back-handed cut?'

Phil gave his solemn promise to lose no time in imparting the dark secret; and content with this assurance, and, sooth to say, finding her companion somewhat dull, Miss Edith departed.

It was half an hour later when, in crossing the terrace, he came full upon the versatile Frenchman, smoking a scented cigarette, and attired in a superb knickerbocker suit and velvet gaiters, reaching almost to the knee. Had he been a Cockney snob instead of a Gallic cad, thought Phil bitterly, he would have found scant welcome at Pencraig.

'I am going to show Miss Rashleigh some of the neighbouring beauties,' he explained airily. 'It is a pleasure to point out to her the beautiful—she has the soul.'

'She has a nice little fortune of her own, too,' said Phil dryly.

Du Maurier shot a suspicious glance at the speaker out of his glittering eyes—a glance Decie returned with a smile of contempt. The Frenchman flipped the ashes from his cigarette languidly. 'Ah, you English take an interest in these sordid, these prosaic details. We, on the other hand, ignore them. When we love, we love madly.'

'Yes—to command. A little money and a little love—an admirable mixture, which is a credit to your disinterested motives.'

'You speak in enigmas, *mon ami*,' Du Maurier returned coldly. 'And I like not your tone. In all politeness, I offer you the chance of explanation.'

Decie, though by no means phlegmatic in temperament, held his rival in such profound

contempt that all anger was swallowed up in the prevailing emotion. As the Frenchman's valiant blood rose, so much the cooler did Phil become.

'Now, all this histrionic business is very taking, no doubt, with people who don't happen to know you. I do. And, without egotism on my part, you will gain nothing by a quarrel—from a physical point, that is. You have made up your mind that you love Miss Rashleigh—for her money. I won't have it.'

'He will not have it!' returned the Frenchman, addressing a gorgeous peacock sailing by in friendly rivalry. 'This dogmatic gentleman will not have it. Horace, *mon cher*, you will please take the back seat.'

'You will have to accept my terms all the same.'

'Ah! I shall have to accept your terms! And wherefore, M'sieu?'

'Because, unless you cease this—this impertinence, you will be under the painful necessity of depriving yourself of the pleasure of Colonel Scobell's hospitality.'

The immaculate Horace came within measurable distance of losing his studied calm altogether. Though a torrent of passion boiled in his veins, there was nothing to indicate a consuming rage beyond a pink spot burning upon his high cheekbones. But with the instinct of a true adventurer, he scented danger; and, like the hunter, braced his nerves for the fray.

'You take a high hand, my friend,' he lightly replied. '*Ma foi*, you English have a strange way of doing things. I thank you for warning me. But as your proverb says, "At that game, two can play." And if I go to the excellent Colonel and say, "You have a thief in the house!"'

Phil laughed aloud, so loud, that Miss Edith, waiting upon the tennis lawn for the initiation into the mystery of the 'cut,' wondered what excellent joke the pair had discovered.

'You would obtain Miss Rashleigh's permission first. Pah! you are a shallower rogue than I took you for. I am certain you could know nothing of that unless you had a hand in it. Besides, Colonel Scobell would be much more likely to throw you out of the window than believe such a tale. Why can't you take a hint?'

'And if I refuse this peremptory request?'

'Then I must speak more plainly. I want no scandal here, the less that your name has become connected with Miss Rashleigh's. I am not speaking without book, understand. I am going to tax your excellent memory, which I have so often and fortunately seen displayed at games of skill—and chance.'

During this speech, the Frenchman had shifted his ground uneasily. The cool measured scorn in Phil's voice alarmed him more than any outburst of violence could have done, there was such a ring of assured certainty behind every word. He had betrayed himself once, a *faux pas* he had no intention of repeating.

'I will call your mind back to a year ago, when you did the university the honour of enrolling yourself as a member. There is a certain billiard-room in the High Street kept by a rascally Greek, and officiated over by an equally rascally marker, a Frenchman like yourself—in fact, your brother,' Phil uttered these words so quickly and simply,

that Du Maurier for a moment failed to comprehend their import. His face was very white and set; he would have spoken, had not Decie waved him aside.

'Yes; I see you remember. You will also recollect young Selby of Trinity. As a source of income he was invaluable to you, I understand. It was one night in the May term I allude to, that, after making him extremely tipsy, you won from him something like fifteen hundred at billiards. He tells me he has no recollection of the event; but you say he gave you bills to that amount, which he does not dispute, and that they were left with you to discount. As Selby was a rich minor at that time, you had no difficulty in passing them. But, like most other knaves, you overreached yourself. A bill was presented by you the other day, and discounted. Selby, somewhat dubious about the signature, handed it to me. It was dated 5th March 1886, which was apparently correct. But upon reading the red stamp in the corner, I found the singular figures 18-1-87. To put it plainly, the thing is a forgery, for the bill stamp is younger than the bill. I need not explain further to a man of your sagacity that this is why I do not consider you a fit companion to cicerone Miss Rashleigh or any other lady round the neighbourhood.'

Du Maurier moistened his dry lips and tried to swallow the choking lump that would rise into his throat. His face presented a singular appearance, like a dead white coal touched with low gleaming points of flame. All his *savoir faire*, his easy assurance, had disappeared; he looked what he was, a pitiful detected swindler face to face with his accuser.

'You will not say anything of this?' he gasped.

'As my friend Selby does not wish to be written down an ass, I shall say nothing. I owe you no malice. Only one stipulation I certainly make, and that is—you leave Pencraig by the first convenient train to-morrow.'

'I am in your hands,' the discomfited Horace replied. 'I must do as you ask. Only, my friend, if you ever come across me again, look to yourself.'

To this characteristic gasconade, Phil deigned no reply beyond a look of supreme disdain. He was perfectly satisfied with himself, and the way he had conducted the somewhat trying interview; for, say what you will, it is no pleasant matter to accuse any one of a mean and contemptible action, to say nothing of a crime.

The afternoon dragged on somewhat slowly till dinner-time arrived. It was not a full-dress affair, though most of the ladies were resplendent in shimmering draperies and shining arms. There was no lack of conversation, with the exception of Decie and his late antagonist, who were strangely silent—the latter, as Phil did not fail to notice, paying more attention to the champagne than thirst or the dictates of good breeding ordains.

'That class of fellow never can resist champagne,' said Bertie *sotto voce*, as he called Phil's attention to the Frenchman's flushed cheeks and gleaming eyes. But Phil did not heed. He was listening with all his ears to a song floating out from the drawing-room, a song he well remembered, the refrain of which rang in his heart like a sharp pain. As he turned in the direction of the

salon, he encountered Beatrice Rashleigh walking towards the garden. With the courage of despair, he turned and took his place by her side. They promenade some distance in silence. A soft moon rode high in the blue arch, shining upon the swift flowing river and on the painful pallor of the girl's face.

'You had better say all you have to say,' she said. 'I did not seek this interview.'

'I think it is my right,' said Phil gently. 'It is more than a year ago since we parted with a tacit understanding. I loved you then—I always shall. Unless you had a little affection for me then, you must be the most selfish coquette that ever took delight in breaking a man's heart.'

'You do me scant justice, Mr Decie. My friends do not find me so.' Beatrice stooped over a rose-tree, breaking off a fragrant golden bud, and carried it to her face. It was not a pleasant or soothing gesture, but her hands trembled so that she felt forced to give them some occupation. But all this was lost upon Phil, who read in it a callous coldness.

'I want you to tell me why you behaved so to me—indeed, I will know. There is something more in your manner than indifference—there is dislike, contempt. What have I done to merit this?'

'What have you done!' Beatrice cried passionately. 'You have bitterly deceived me. I liked and trusted you—nay, more, if you will hear the truth, I loved you until that day—you, you know of. Oh, Phil, Phil, why did you not come to me if you were in trouble or distress, and tell me everything! Do you think that I should have thought the less of you because such things do not come within the unwritten laws of society? I would not have minded; I would have helped you.'

'I daresay you would,' Phil returned forlornly, 'only I had no occasion to ask for your help. I understand what you mean. How can I help it? You think I—I stole your diamond bracelet!'

'How otherwise?' retorted Beatrice. She had recovered from her momentary fit of emotion, and looked him in the face with hard scornful eyes. 'You always made me your *confidante*—even that silly escapade of yours when you had to pawn your watch, I heard of from you. I have a good memory for trifles. Do you remember the assumed name you used on that occasion?'

'I am not so used to the inside of those places that I am likely to forget,' said Phil bitterly. 'To be correct, it was Philip Reid.'

Beatrice answered nothing, but taking from the bosom of her dress a square yellow ticket, handed it to her companion. It bore the name and address of a well-known Cambridge jeweller, and ran to the effect that a certain diamond bracelet with ruby medallion had been deposited with the person therein named, to secure the repayment of a loan of thirty pounds advanced to Philip Reid.

Phil gazed at the shabby little pasteboard like a man in a dream. The idea of his being guilty of such an act struck him dumb with amazement. 'Beatrice,' he said solemnly, as soon as he found voice to speak, 'on my word of honour, I know nothing of this. Still, the proof is strong—undeniably strong. Will you try and trust me once more?'

'What is it you want me to do?'

'Leave this in my hands for a little while. Will you?'

She turned away from him with a choking sob. All the harshness and coldness had melted from her heart; she was for the moment a gentle loving woman. 'Anything to clear this wretched mystery. If you can restore my broken faith, it will be the happiest day I have known for eighteen months.' Without another word she turned away, leaving Phil to gaze after her in rapt astonishment.

PARVENUS.

ENGLAND is a great nation, and its greatness has been built up principally by the enterprise and business capacities of Englishmen, of whose abilities and perseverance any nation might be proud. Oddly enough, however, although their merits are generally appreciated after death, and often then commemorated by 'storied urn and animated bust,' they labour during their lifetime under what may be termed a social ostracism. If we are asked to define socially the position of a man who, by force of will, by inventive genius, by determination to succeed and a capacity to do so, has prominently raised himself from the ranks of his fellow-men, we borrow a term from our French neighbours and call him a *parvenu*. If, with a general knowledge of what is meant by a *parvenu*, we turn to our Anglo-French Dictionary to ascertain its exact equivalent in English, we find it given as an 'upstart.'

The advent of a stranger who buys a place and settles down in the country naturally excites much curiosity, and gives rise to a good deal of gossip amongst his neighbours; and happy the man who, having been fortunate enough to glean full particulars about the new-comer, is in a position to give a more or less accurate account of him in response to the invariable question, 'Who is he?' This question does not refer to his character, genius, or ability, but is understood by the initiated to refer simply to his antecedents in the way of family and family connections. If he comes from what is considered a good stock, if he or his wife is well connected, then the answer comes readily, and is sure to be a satisfactory one. He may be a fool or a rascal—that is not even taken into consideration; people who live in glass houses must not throw stones; he belongs to the right sort, and he and his belongings are warmly welcomed by, and at once take their place among the élite of the county.

Among the same set of people comes a stranger who has no record in the gilded pages of Debrett, and whose name is unknown to the compiler of the *County Families*. By the exercise of such commonplace qualities as prudence, patience, and self-denial in his youth, and honesty and perseverance in his prime, he has in the decline of life amassed a considerable fortune. Sensible of his own defects in the way of early education, he has given his children the best that our public schools can afford them; and now his one object is to see them take that social position which he considers that their means and education entitle them to. Alas for his hopes! The county will have nothing to say to him: he is a *parvenu*: he actually made his fortune in

trade; and those whose fathers or grandfathers did the same are the first to turn up their noses at him. No; he must be content to think that possibly his children or grandchildren may venture within the portals which are now resolutely closed to him, as being only the founder of a family.

He may console himself, if he can, by reflecting that in 'the dim and distant future' his descendants, if they carefully avoid doing all that he has done, if they stick to the property which he has purchased and the wealth which he has amassed, if they sedulously devote themselves to fox-hunting and shooting, and never do anything really useful all their lives, may confidently count upon gradually becoming more and more akin to their neighbours, like them in manners, feelings, and ideas, till they end by imperceptibly amalgamating with them and becoming themselves a county family. Then their turn will come, and they will do unto their neighbours as their neighbours are now doing unto them. They will be the most rigid sticklers for county exclusiveness; the bare idea of a manufacturer or any one who has made a fortune in trade being put up for a Hunt Club or invited to a County Archery Meeting will make the ladies of the family raise their eyes in mute astonishment, and the brothers pull their moustaches with scorn.

Curiously enough, these are the people who are the real arbiters of the social world. The old aristocracy, the families who have flourished in the county for centuries, care little or nothing about these things. Secure in their own position, they can meet all sorts of people without the least fear of being contaminated. It is a matter of indifference to them whether they meet the respectable Jones himself at a county gathering, or the children or grandchildren of the said Jones. There is no fussiness, no anxiety to dodge this person, and be prepared with a grateful smile for a recognition by that. The true grand seigneur is courteous and considerate to all; he dwells in a moral region wherein the envy, malice, and all uncharitableness of Society cannot enter.

On the other hand, the real parvenu—that is, the one who, having succeeded, after the process already described, in getting a footing in county Society, tries to pose as having always belonged to it—unconsciously betrays himself or herself to the initiated at every step. There is a want of repose, to begin with, a self-assertive manner, an anxiety to let everybody know that he or she is acquainted with the best people, an eagerness to bring great names into ordinary conversation. We don't want to know that Mrs Tomkyns met dear Lady de Smith at dinner last Wednesday, and that she was so nice; but she insists upon telling us, whether we like it or not. It is no concern of ours that Mrs Brown-Jones and her husband stayed two nights last week with that charming old Lady Doldrum at Doldrum Castle, and that she was so sweet and so nice to them; but we must listen to it all. Indeed, it would be cruel not to listen, for she and Brown-Jones simply went there that she might talk about it for the rest of her life. Jones, who is an honest fellow enough, but with no moral courage whatever where his wife is

concerned, will tell you as much. He says that that visit to Doldrum was the most frightful thing he had ever undergone in his life: the old woman had a lot of people in the house, and was barely civil to them. The groom of the chambers took his cue from her, and was so supercilious that Jones could have kicked him; instead of which, he had to give him a sovereign; and what with the butler and the footman, and the coachman who drove him to the station, and the tips which his wife had to give, Jones said they could have stopped at the *Grand* or the *Métropole* and been better 'found' for the money, to say nothing of the comfort.

There is a Nemesis, therefore, in social matters, as in most others. Parvenu acts and reacts upon parvenu; each in turn must pass through the social crucible; and so long as the 'tenth transmitter of a foolish face' is held in greater honour than the first recipient of a wise one, it is likely to continue so. Retribution, however, is even now overtaking us; the old order is rapidly giving place to the new; manufacturers and shopkeepers are gradually becoming the owners of the soil. They will soon be powerful enough to make social laws of their own; and when they do occupy that position, it will be neither safe nor expedient to sneer at the parvenu.

READY WIT.

THERE are few people to whom the possession of ready wit does not seem desirable, for nothing is of more use in an emergency than the ability to return 'a Roland for an Oliver' in such a way as to extinguish an opponent. But the art of retaliating skilfully is by no means universal. Perhaps this is as well, considering the proneness of repartee to degenerate into maliciousness; and it is not difficult to imagine how much more disagreeable the world would be if every one in it were a Douglas Jerrold or a Horne Tooke.

None of the professions seems more devoted to ready wit than that of the law; and, judging from the following story, this devotion is of no recent origin. It is related that on one occasion Sir Nicholas Bacon was about to pass judgment upon a man who had been guilty of robbery, at that time punishable by death; but the culprit pleaded for mercy on the ground that he was related to the judge. 'How is that?' he was asked. 'My lord,' was the reply, 'your name is Bacon, and mine is Hog, and hog and bacon have always been considered akin.'—'That is true,' answered Sir Nicholas; 'but as hog is not bacon until it has hung, until you are hanged you are no relation of mine.'

Still more to the point is an anecdote told regarding two opposing barristers. The lawyer for the defence was so severe upon the prosecutor that the latter rose and asked: 'Does the learned counsel think me a fool?' The retort was prompt: 'My friend wishes to know if I consider him a fool; and in reply to his question, I can only say that I am not prepared to deny it.'

There are many instances of passages of arms

between Bench and Bar, but this one may be new to most of our readers. At the close of a lengthened wrangle between a judge and a prominent counsel, the former said: 'Well, sir, if you do not know how to conduct yourself as a gentleman, I am sure I can't teach you.' To which the barrister mildly replied: 'That is so, my lord.'

Occasionally, however, the votaries of the law have the tables turned upon them, as in the case of the lawyer who, driving along a country road, asked a woman who was going in the same direction the way to his destination. She told him, and added that, as she was going part of the journey, she would point out the way. 'All right, my good woman,' said the lawyer; 'jump up—better bad company than none.' After going some miles, the woman thanked him for the drive and descended, and he asked how much farther he had to go. 'Oh,' she answered, 'you passed the place you want two or three miles back; but as I thought bad company better than none, I brought you on.' The legal gentleman certainly deserved the lesson, and it is to be hoped that he profited by it.

Parliamentary elections usually afford a good field for the exercise of wit. While a noble lord was conducting his canvass, he met a bully, who declared fiercely that he would 'sooner vote for the devil than for him.'—'I've not the slightest doubt of it, my friend,' said the candidate quietly; 'but in the event of your friend not coming forward, may I count on your vote?' Here is another of the same kind. At an open political meeting a man cried, 'Hurrah for Jackson!' to which a bystander retorted, 'Hurrah for a jack-ass!'—'All right, my man,' exclaimed the first speaker; 'you can hurrah for your favourite candidate, and I'll do the same for mine.'

An enviable quickness of repartee was shown by a French actor when the head of a goose was thrown upon the stage. Advancing to the footlights, he said: 'Gentlemen, if any one among you has lost his head, I shall be glad to restore it at the conclusion of the piece.' Deservedly severe also was the reply of Descartes to a nobleman, who, seeing that he enjoyed the pleasures of the table, remarked: 'I see, sir, that philosophers can sometimes indulge in good cheer.'—'Why not?' asked Descartes. 'Do you really imagine that Providence intended the good things of this earth only for the foolish and ignorant?'

Of wit bordering on the malicious there are many examples, and some of the repartees are fully deserved, while others are only calculated to give pain. Amongst the latter is one told at the expense of an elderly French widow who had fallen in love with a young nobleman, whom she was never tired of praising to her friends as 'handsome as one of Dumas' three musketeers.' 'Yes,' said a lady who heard her, and who was possibly jealous; 'he is the musketeer, and you are *Twenty Years After*.'

Much more merited than the above, probably, was the answer given by Foote to a dissipated Duke who asked him in what new character he should go to a masquerade: 'Go sober!'—A 'man about town' said to a young lady: 'No, I'm not exactly engaged, but I have the refusal of two or three girls.' He undoubtedly deserved the crushing rejoinder: 'I suppose you mean you have asked them and they have said "No."—The

tourist, also, who said to an idle Skyeman, 'Why do you lie there all day with your hands in your pockets?' must have been taken aback by the cool reply: 'Cause she hasna been far enough south to learn to put them in other people's.'

Ready wit cannot be said to be natural to youth, for the answers given by precocious schoolboys are not witty, being usually the outcome either of misunderstanding or of 'cheek.' There are exceptions, however, to this rule. A teacher asked his class what was meant by 'divers diseases,' and was rather surprised when one of the boys answered, 'Water in the head.' A little dot of a girl inquired of her mother the meaning of 'transatlantic,' and was told, 'Across the Atlantic.'—'Does "trans" always mean "cross," mamma?' she then asked.—'Yes,' replied her mother; 'but don't bother me any more.'—'Then I guess "transparent" means a cross parent,' was the conclusion the unconscious little humorist came to as she relapsed into silence.

The Lord Provost of a certain well-known city in the north had a daughter married to a gentleman of the name of Baird; and speaking of names to several friends, he happened to remark: 'My grandmother was a Husband and my mother a Man,' these having been the maiden names of the ladies.—'Why, in that case,' said the celebrated Dr Gregory, who was present, 'we may the less wonder at your daughter having got a Baird.'

Turning from expressed repartee, we find that there can be no less wit in the manner in which writers subscribe themselves. For instance, we have it upon record that, when Glengarry claimed the chieftainship of the Macdonald clan, the generally acknowledged chief wrote to him as follows: 'MY DEAR GLENGARRY—As soon as you can prove yourself my chief, I shall be ready to acknowledge you. In the meantime, I am *yours*—MACDONALD.' This letter may have suggested to Benjamin Franklin the note he wrote to a friend in England when the American colonies declared their independence, and which closed thus: 'You and I were long friends. You are now my enemy, and I am *yours*—B. FRANKLIN.'

During the last half of the eighteenth century the governments of the day frequently kept themselves in power by bribing and corrupting members of parliament; and this was the case during the debates on the India Bill, when the opposition, led by Fox, found its majorities steadily decreasing. This, it was known, was the work of the Secretary to the Treasury, John Robinson, who used both places and money to carry out the ministerial policy. One evening Sheridan, speaking of the decrease, said: 'This is not to be wondered at, Mr Speaker, when a member is employed to corrupt everybody to obtain votes.'—'Who is it? Name him, or withdraw!' rose fiercely from all parts of the House. Sheridan saw that he was in a predicament, but he was equal to the emergency. 'Sir,' he said, 'it would be an unpleasant and an invidious thing to name the person, and therefore I shall not do it. But don't suppose, sir, that I refrain because there is any difficulty in naming him; I could do that, sir, as soon as you could say Jack Robinson.'

Sheridan's ready wit was equalled some years ago by another prominent politician on the occasion of the Derby being won by a French horse. The Frenchmen present, as was natural, cheered

vociferously, and not content with that, one of them shouted, 'Waterloo avenged!'—'Yes,' said the statesman, who happened to hear the remark, 'you ran well in both cases.'

NATURAL GAS WELLS OF PITTSBURG, PENNSYLVANIA, U.S.A.

THESE wells have now come to be regarded as some of the wonders of the world; certain it is that since their discovery the attention of the world has been attracted to the busy and favoured American city in whose neighbourhood they exist, and for whose numerous and ever-increasing industries they supply the motive-power. 'To those not familiar with the facts,' as one has well said, 'the story of this new manufacturing facility is like a fable. It does seem almost incredible that a great community of three hundred and fifty thousand people, of whom one hundred thousand find employment in workshops, carry on all the avocations of life, where heat, fuel, or light is concerned, by the use of this invisible vapour, furnished by nature, and distributed by pipes to dwellings, factories, warehouses, schools, churches; and the city transformed thereby from one of the smokiest, gloomiest, dirtiest of the country to one of the cleanest and brightest, by its use, in something over two years. It seems almost a leaf out of the *Arabian Nights* or some other fairy-story volume.'

Although found in smaller quantities at greater distances, the principal supply of gas seems to be confined within a radius of from fifteen to thirty miles from Pittsburg. Its temperature, when proceeding directly from the wells, is about forty-five degrees, its pressure from two to four hundred pounds to the inch, although some have known it to reach a pressure of eight hundred pounds. As may be inferred from these figures, it rushes upwards from the bowels of the earth with a tremendous and almost uncontrollable force. Its roar, as it shoots forth in a solid column of flame to the height of fifty feet from a fresh tapped well, is said to be deafening, and can be heard at a distance of six miles. The gas is found in certain formations at a depth varying from seventeen hundred to two thousand one hundred feet. This mysterious vapour when analysed gives the following result: Marsh gas, 67 parts; hydrogen, 22; ethylic hydride, 5; nitrogen, 3; carbonic acid, $\frac{1}{10}$; carbonic oxide, $\frac{1}{10}$; oxygen, $\frac{1}{10}$. Regarded as a fuel, its total freedom from sulphur makes it invaluable in the treatment of minerals, iron, steel, glass, and oxides of lead.

How was this mysterious product of nature formed? Is its creation still in progress? or will it exhaust itself? These are inquiries of the highest importance; and they are found upon the lips of others besides the fortunate inhabitants of Pittsburg, whom they more immediately concern. In reply to the question of how long the earth will continue to furnish this vapour, a writer in a recent issue of the *Pittsburg Despatch*, to whom we hereby acknowledge our indebtedness for the

most interesting portions of this article, says: 'Its continuation were a question on which some definite conclusion might be arrived at, if its production were understood. On this point there are three leading theories: one, that it is the result of the distillation of the fern-formed resinous plants of the Devonian age, the gas from which became stored in the sand rocks and fissures that form the tanks from which it is now released. Another is, that it is the result of the percolation of interior springs and surface rainfall through the earth's crust, the water becoming impregnated in its passage through carbon and slate formations with their qualities, and reaching a certain depth by that slow percolation the heat of the earth evokes from such water a gas. These theories,' the same writer adds, 'are yet speculative; but there are certain facts as to the rising of this gas to the surface that may give some idea of its continuance.' He then proceeds to tell us what some of these facts are. In America, a similar or identical gas is known to have issued from the same wells for more than a century. In the State of New York it has been burning in wells for fifty years. At East Liverpool, on the river Ohio, some thirty or forty miles from Pittsburg, it has been used for manufacturing purposes for twenty-five years; and also in West Virginia, the wells show little or no decrease in pressure. It is well known that many of these wells have become exhausted or decreased in their pressures. But on being examined, it has been found that it was not from any exhaustion of gas, but from a clogging up of the pipes or in the inflowing of salt water. The gas has a tendency to deposit a substance in the casing similar to a salt or paraffin, which fills up the pipe, which being removed, the flow resumes at its usual volume.

As far back as 1875 the Pittsburg natural gas was utilised to a limited degree in two iron mills; but it was not until 1884 that a Company was formed on a large scale for the systematic introduction of the gas into the city for practical purposes. At the present time there are eight such Companies in Pittsburg; and in addition to hundreds of miles of pipe conveying the gas from the wells, there are over two hundred miles of pipe to convey the gas to the consumers laid under the streets of Pittsburg and Allegheny. All this has been accomplished in a little over two years; and it is said that there is 'virtually not a workshop or dwelling to which pipes can be run from the mains where it is not the only fuel used, and represents a displacement yearly of about four hundred thousand tons of coal, as nearly as could be estimated.' The pipes referred to are of wrought iron, with a diameter of from six to fifteen, and in some cases twenty-four inches.

With a view of furnishing the reader with an adequate idea of the amount of work accomplished by the combined efforts of the several Gas Companies referred to above, it will be sufficient to adduce the following facts relative to those of one of them, the Chartien Valley Gas Company, which is said to possess the largest line in the world for the conveyance of natural gas, which is twenty miles in length! Before this large line was constructed, the Chartien Valley Company could deliver eighty-five million cubic feet of gas every twenty-four hours. The new line will deliver alone in round numbers the almost incred-

ible amount of one hundred million cubic feet every twenty-four hours, making a total of one hundred and eighty-five million cubic feet per day. This amount of natural gas will do the work of seven thousand five hundred and thirty tons of coal, to transport which it would take every day five hundred and two cars, holding fifteen tons each, which would make a train over three miles long.

Lastly, a word as to the uses to which natural gas can be applied. Seeing that it can be conveyed anywhere with the greatest ease, and with the minimum of expense, it can be applied to every conceivable purpose under the sun which is concerned, whether remotely or directly, with light and heat. 'The range from iron furnaces to asparagus beds is wide, yet in the latter instance it has been utilised, with the result of producing that vegetable in the open air in February. This was simply by running pipes along the beds with orifices every eight or ten feet for the escape of the gas, which being ignited, created such a summer atmosphere as caused the agricultural result cited. If asparagus, why not other vegetables, and in winter's dreariest months? It does not seem impossible to thus create an atmosphere of tropical productiveness. This seems to border on romance; yet go to one of the new-struck wells and feel the heat; see the grass flourishing in winter as in summer, trees budding, flowers blooming, and recall this practical application of gas just cited, and there seems more of fact than nonsense in a possibility that it will be used in agriculture as well as manufacturing. There is so much of fact, of probability, and of conjecture within the possibilities of natural gas, that much space might be consumed in considering it.'

TRUSTEES' LIABILITY.

A correspondent writes us as follows: 'Referring to the useful article in your issue of the 21st April respecting the liability of trustees, the following further forcibly illustrates the risks which are often unconsciously run by those occupying that undesirable office.

'A wealthy foreign merchant, resident in London, left by his will power to his executors to invest the proceeds of his estate according to their absolute discretion, and the will further contained a clause exonerating them from all liability in case loss should ensue from any such investments. The executors—who were also the trustees under the will—in accordance with the powers so confined, invested a considerable sum in foreign government securities, not being satisfied with the moderate interest arising from the class of investments sanctioned by English law. After some years, circumstances arose which induced the executors to apply to the Court of Chancery to undertake the future administration of the estate. The application was granted; and they were called upon to furnish a statement of their dealings with the property, from which it appeared that a heavy loss had resulted from the foreign investments. This loss, notwithstanding the terms of the will, the court compelled the trustees to make good, holding that, unless other securities were specifically named, the discretion of trustees did not extend beyond the limits assigned by the

court. The decisions in the City of Glasgow Bank affair, where, in several instances, trustees were called upon to make good losses arising from continuing—not actually making—investments in the shares of that unfortunate concern, also serve as emphatic warnings to executors and trustees.'

A SONG OF SUMMER.

On, lovely sunbeams through the meadows dancing
On golden pinions all the livelong day,
Kissing young leaves, on crystal streamlets glancing,
Changing to living gold their silver spray;
Wee amorous elves, coquetting with the roses,
 wooing the daisy in her grassy bed
Till the shy flower unconsciously uncloses
Her dew-gemmed leaves, and blushes rosy red;

Gilding gray rocks, on rugged mountains streaming,
Bidding the flowers in sheltered nooks awake,
Calling young song-birds from their happy dreaming,
Waking the laughter of the dimpling lake;
Playing 'Bo-peep' amid the white buds blowing
In pearly clusters on the hawthorn tree,
To the round eyes of wondering childhood showing
The rapid journeyings of the wandering bee!

Shedding a halo bright on youthful tresses,
Bidding young hearts for very rapture sing,
Touching the brow of care with kind caresses,
Or glinting lightly on the skylark's wing.
Ah, merry sunbeams, like sly Cupids straying
In the glad footsteps of the rustic lass,
On sun-tanned cheek and snow-white kerchief playing,
Twinkling like fireflies in the emerald grass!

Oh, lovely sunbeams, like blest angels gliding
Through courts of squalor, sickness, want, and gloom,
Telling of clouds like golden chariots riding
Proudly majestic o'er a world of bloom!
Of winding lanes, and milk-white homesteads peeping
Like modest virgins from secluded bowers;
Of shallow pools, and baby streamlets leaping
In giddy gladness 'neath down-drooping flowers.

On the poor children playing in the gutter,
Nursed amid hardship, bitter tears, and sighs,
Kissing their rags like loving friends ye flutter,
Warming their limbs, and sparkling in their eyes!
When from the dust they raise their beaming faces,
Once pinched and wan, now radiant with delight,
Ye love to show a thousand fairy graces
That want and squalor have no power to blight.

Dance, lovely sunbeams, through fair country meadows,
Bathe hall and cottage in your holy light,
From city slums go chase the mournful shadows
That fill poor homesteads with eternal night.
To those who pine in ignorance and sorrow,
May all your tenderest, holiest gifts be given,
That sorrowing hearts one ray of hope may borrow
In the sweet knowledge that ye come from heaven.

THE CHINESE IN THE COLONIES.

For a period of thirty-five years the antipathy of the white settlers in the Australian colonies to the presence of the Mongolian stranger has been steadily growing and manifesting itself in a variety of unmistakable forms. 'John'—which is the generic name of the Chinaman in the colonies—has to pay a heavy poll-tax before he is permitted to land; but compliance with colonial law in this respect does not always avail to save him from popular violence. He is not unfrequently hunted away from gold-fields, and bruised and beaten in towns and cities. He rarely attempts to retaliate; he takes his punishment meekly; he accepts rough treatment as his appointed lot, and he thrives under Caucasian persecution. Hitherto, however, the antagonism to the Chinese in the colonies has been of a local and personal character; but a crisis has suddenly arisen, and the Australians are now organised and united in their determined opposition to any further influx of Chinese immigrants. Now that America is legally closed for the next twenty years against the advancing Mongolian host, the colonists recognise the imperative necessity of united action if Greater Britain is to be conserved for the British race and not overrun by an alien population.

The reasons that underlie the hostility of the colonists to the Chinese are plain and intelligible. Immigrants from all other countries can be assimilated and welded with mutual advantage into the general mass; but the Chinaman cannot coalesce with the European, and must of necessity occupy an isolated position. They possess no feelings or tastes in common, and are mutually antipathetic. The Chinaman makes not the slightest effort to rise to the superior level of his new surroundings, but merely transfers his Asiatic mode of living to the antipodes, congregates in an exclusive quarter of his own, treats the laws of decency and health with sublime contempt, and is content to live in such an abbreviated space and limited atmosphere that the wonder is how it is possible to sustain life at all under these insanitary con-

ditions. He differs from immigrants of all other nationalities in another most important and radical respect, for, in ninety-nine cases out of a hundred, the Chinaman is not accompanied by a wife or female relative; and the necessary consequence of this unnatural state of things is that his 'camps' on the gold-fields and his 'quarters' in the cities are notorious for the immorality prevalent in them. He also introduces wherever he goes a most insidious form of gambling, by which young Europeans are oftentimes demoralised and ruined; and he relies with but too much success on the seductive influences of the opium-pipe to attract European women and girls to his dens, and to keep them there as captives to this most tyrannical of drugs. All other immigrants come to stay, and to establish homes for themselves and their families on Australian soil; but the average 'John' never regards himself as a permanent resident, and invariably hastens back to the Flowery Land as soon as he has accumulated a few hundreds of pounds in the colonies.

The last and, from the utilitarian standpoint, the weightiest count in the indictment against the ubiquitous Mongolian is that he slowly but surely throws the white man out of employment, and secures to himself a monopoly of certain favoured departments of mechanical industry. This he is enabled to do by reason of the singularities of his life and character, for he can live on a small daily modicum of rice; he has no wife or family to support; he is never troubled by the demands of conformity to Western civilisation; and he can thus save money out of what would be starvation wages to the European workman. He is willing to work for all hours, and in this manner makes up by persistent toil for what he lacks in physical strength and stamina as compared with his European competitor. Unwearying industry is ordinarily a very commendable virtue; but to the white man, handicapped as he nearly always is by a home, a wife, and a family, it is not surprising that the untiring assiduity of 'John' to the trade of his choice should be regarded as essentially vicious, and should lead to the engendering of bad

blood between the races. The Chinaman is an unfair and unequal competitor, an uncompromising alien, an uncivilised animal, an unwholesome neighbour, and an impossible colonist. That is the sum and substance of the colonists' deep-rooted objections to the threatened multiplication of Chinese 'quarters' and 'camps' on their territory.

The Chinese quarter in the city of Melbourne, the capital of the colony of Victoria, is situated at the eastern end of a long narrow thoroughfare called Little Bourke Street, from which numerous dark and grimy lanes diverge, conducting the venturesome visitor away from the familiar sights and sounds of the modern metropolis into the strange and crowded haunts of the chattering Celestials. The houses in these unprepossessing lanes and alleys are mostly old and decrepit; they constitute the antipodean equivalent to the London slum; but every room is seen to be utilised to the utmost extent. As many as thirty Chinese have been known to find sleeping accommodation in a small apartment which, according to European notions, would not be capable of comfortably lodging four or five persons. In the matter of economising space the Chinaman is confessedly *facile princeps*. The number of bunks or sleeping-berths with which he can surround the interior of an ordinary room passes comprehension, and, in stereotyped phrase, must be seen to be believed. The atmosphere within these extemporised dormitories, it goes without saying, is the reverse of pleasant to the nostrils of the casual visitor; but the regular frequenters apparently suffer no discomfort and are perfectly at ease amidst their noxious surroundings. It is a peculiarity of the Chinese that they rarely resent an intrusion on their privacy, if such a word is permissible in connection with these communistic abodes, and the European visitor is thus at liberty to enter where he pleases and survey the scene without fear of interruption. As a rule, the Chinese evince no recognition of the stranger's presence, maintaining an attitude of stolid placidity, or at most, giving one momentary glance of quiet unconcern. They can thus be studied in the act of manufacturing furniture and various household accessories for the citizens of Melbourne—a department of colonial industry in which they have almost succeeded in gradually elbowing the superior race out of the field. They can be watched as they lie in their narrow bunks, slowly inhaling the intoxicating fumes of the opium-pipe; or, with a look of ecstasy on their pallid countenances, revelling in those gorgeous visions of majestic palaces, tremendous heights, and picturesque processions which the narcotic drug conjures up before the mental eyes of its slumbering devotees. They can be seen in their quaint little eating-houses skillfully plying their chopsticks and philosophically sampling the mysterious viands that are concocted by their favourite Celestial cook. They can be observed whilst intently interested in their popular game of 'Fan-tan,' when they risk their shillings and sixpences on the accidental number of little brass tokens that may happen to be covered by the presiding genius of the gambling-table. And on Sunday afternoons they can be seen in their hour of relaxation, squatting in long lines on the kerbstone in front of their dwellings, and discussing the events of

the week with a volubility and a unanimity that make the locality exceedingly lively and Babelish.

As an itinerant hawker of fish and vegetables, 'John' is a familiar figure all over Australia. With his large and heavily laden circular baskets suspended from either end of the bamboo pole swung across his shoulders, he ambles along from street to street, and generally succeeds in doing a good business with careful economising housewives. It is alleged that the Australians are practically dependent on the Chinese market-gardeners for their vegetable supplies, and that something resembling a famine in this commodity would probably ensue on their expulsion from the colonies. The first portion of this allegation is in a large measure correct; but the second by no means necessarily follows. The fact is that, for the reasons already detailed, the Chinese vegetable-growers were able to undersell their white competitors, and compel many of them to retire from an unprofitable industry. If unfair Chinese competition were checked or excluded, this industry would simply revert to European hands, and the price of vegetables to the consumer would undergo a corresponding but not unreasonable increase.

On the gold-fields, 'John' is detested with a widespread bitterness that has frequently found expression in open violence. He exasperates the European diggers by rarely, if ever, searching out gold for himself, and by coming in vast crowds wherever the white man makes a discovery of the precious metal. He thus reaps a harvest that he has not assisted to sow. He profits by the pioneering enterprise of the European without exposing himself to any of its attendant risks or dangers. He knows by experience that, when it has once been definitely ascertained by the white man that payable gold exists in a certain spot, there is a very strong probability of the surrounding locality also proving auriferous. He therefore spreads himself all over the neighbourhood, prospects in every nook and gully, collects as much gold as he can out of the alluvial, and thus deprives the original discoverers of no small proportion of the fruits of their enterprise. The knowledge that none of the gold thus obtained by alien hands would be circulated for the good of the community at large, but that it would all be carefully hoarded up for transportation to China, intensified the animosity between Caucasian and Mongolian in the mining districts. In the annals of almost every one of our colonial gold-fields, conflicts between whites and Chinese are recorded. The most memorable of these racial encounters occurred at a diggings called Lambing Flat, in New South Wales, when a body of three thousand diggers attacked the Chinese camp, and, after committing many excesses, burnt it to the ground. The aspect of affairs became so serious that it was deemed necessary to despatch the Imperial military forces from Sydney to quell the riot and restore order.

On gold-fields that have been abandoned by the whites, either because they appeared to have been worked out, or because the yield of the precious metal was not sufficiently satisfactory in European estimation, the Chinese always make a good living, and sometimes secure valuable prizes. They enter into possession of the abandoned

workings, resume operations in their leisurely methodic fashion, and are occasionally rewarded for their perseverance by the discovery of a handsome nugget. But 'fossicking' is their favourite pursuit on these deserted fields. This consists in slowly and deliberately raking over the unsightly heaps of upturned earth that are the dismal mementoes of the white man's former presence. The vigilant eye of the Chinaman detects in these hurried accumulations many a minute particle of gold, and sometimes a piece of quartz studded with the precious metal that escaped the observation of his white predecessor; and there is rarely a day on which he does not return to his tent in the evening the richer for this process. In travelling through the gold regions of Australia, no sight is more familiar than the abandoned diggings, dotted here and there with the patient plodding Chinese, each bent low with his handy little rake, analysing the contents of the white man's leavings, or scrutinising the alluvial deposits in the bed of the neighbouring creek.

The Chinese have a New Year's Day of their own, and they welcome its advent by a prodigious discharge of fireworks and a general display of coloured lanterns in front of their houses. On this annual festive occasion the Chinese camps and quarters are seen in a novel and picturesque dress, the repulsive and demoralising features that characterise their every-day aspect being rendered much less prominent in the variety and liveliness of the spectacle. Many Europeans embrace this favourable opportunity to study 'John' in his hour of collective gaiety, to see him lifted for the moment out of his customary animal existence, and indulging in a mild form of aestheticism, to gaze upon his eccentricities in illuminations and the vivacity of his interest in the pyrotechnical performances of the festival. Another annual ceremony which usually attracts a crowd of inquisitive spectators, but has nothing in the nature of artistic accessories to recommend it, is the exorcism of the devil from the camp. The spirit of evil is scared away by the vigorous and prolonged beating of Chinese drums and the shrill wailing of Chinese fifes—a combination of aggressive forces which the most determined demon could not withstand for any length of time.

Few and far between are Chinese women in the colonies; but they seem to be prized in proportion to their rarity, and are seldom seen in public. When they do come under the observation of the Caucasian eye, they are invariably attired in striking costumes of several colours, that give them a butterfly appearance as they pass on their way through the crowd. Sometimes, too, a little Chinese child is encountered, with its incipient pigtail, its miniature velvet smoking-cap, its inquisitive almond eyes, and its attenuated body enveloped in queerly cut garments of the brightest hue. A percentage of the unfortunate European girls who have either been betrayed into the hands of the Chinese or have voluntarily entered their camps, adopt the fantastic costume of the Mongolian female; but the majority of these hapless waifs naturally shrink, even in this deepest degradation, from an act that would seem to imply a total severance of the connection with the world of civilisation without. A few wealthy

and cultured Chinese in the colonies have married white women, and these unions have proved mutually satisfactory; but it must be borne in mind that the cultured Chinaman is a *rara avis* on the great southern continent. Those of them to whom that complimentary phrase could be truthfully applied might be counted on the fingers. In the whole of Victoria there are only two Chinese residents whose figures stand out prominently against the dark background of ignorance, vice, and degradation which the mass of their fellow-countrymen presents to the general gaze. One is Kong Meng, a wealthy Melbourne merchant, and a master of several languages; the other is Cheek Hong Cheong, the only Chinese graduate of the University of Melbourne, an excellent English speaker, and a representative elder of a suburban Presbyterian church. In the colony of New South Wales only one Chinaman has so far attracted public attention, a tea-merchant named Quong Tart, who has laboured hard but unavailingly for the suppression of the demoralising opium-trade amongst his countrymen.

In forcing this unholy traffic upon the unwilling Chinese at the cannon's mouth, the government of Great Britain became guilty of a most unwise and mischievous proceeding, for which the international complications that are likely to arise out of the threatened Chinese invasion of the colonies may be in some sense a retribution. But however this may be, the latest information from Australia leaves no room to doubt that the colonists are firmly resolved never to allow their territory to be overrun by an alien population. They have already between forty and fifty thousand of these objectionable aliens in their midst, and they see clearly that the thousands will gradually grow into millions, and eventually outnumber the European inhabitants, if a strong and effective barrier against the teeming hosts of China is not raised at the right time. The Premier of Victoria (the Hon. Duncan Gillies) has pithily summed up the anti-podean situation in a sentence in his recent memorandum on the subject for the information of Lord Salisbury: 'In the infancy of a nation, the question of race is of paramount importance, and the issue is therefore raised, whether in the occupation of this great continent, with all its possibilities of progress, and its opportunities of outlet for the surplus populations of Europe, we are to admit hordes of the Mongolian race, or, on the other hand, to reserve it for those people—our own, or kindred to our own—that have led the van of the world's civilisation.'

THIS MORTAL COIL.

CHAPTER XXXIII.—Continued.

WHEN the hired man from the mews behind flung open the drawing-room door in his lordly way and announced in a very loud voice, 'Mrs Bouverie Barton and Mrs Hugh Massinger,' neither Warren nor Edie was in the front room to hear the startling announcement, which would certainly for the moment have taken their breath away. For communications between the houses of Relf and Massinger had long since ceased. But Warren and Edie were both up-stairs. So Winifred and her hostess passed idly in (just shaking hands by

the doorway with good old Mrs Relf, who never by any chance caught anybody's name) and mingled shortly with the mass of the visitors. Winifred was very glad indeed of that, for she wanted to escape observation. Sir Anthony's report had been far from reassuring. She preferred to remain as much in the background as possible that afternoon: all she wished was merely to observe and to listen.

As she stood there mingling with the general crowd and talking to some chance acquaintance of old London days, she happened to overhear two scraps of conversation going on behind her. The first was one that mentioned no names; and yet, by some strange feminine instinct, she was sure it was of herself the speakers were talking.

'Oh yes,' one voice said in a low tone, with the intonation that betrays a furtive side-glance; 'She's far from strong—in fact, very delicate. He married her for her money—of course: that's clear. She hadn't much else, poor little thing, except a certain short-lived *beauté du diable*, to recommend her. And she has no go in her; she won't live long. You remember what Galton remarks about heiresses? They're generally the last decadent members, he says, of a moribund stock whose strength is failing. They bear no children, or if any, weaklings: most of them break down with their first infant; and they die at last prematurely of organic feebleness. Why, he just sold himself outright for the poor girl's property; that's the plain English of it; and now, I hear, with his extravagant habits, he's got himself after all into monetary difficulties.'

'Agricultural depression?' the second voice inquired—an older man's and louder.

'Worse than that, I fear; agricultural depression and an encroaching sea. Besides which, he spends too freely.—But excuse me, Dr Moutrie,' in a very low tone: 'I'm afraid the lady's rather near us.'

Winifred strained her ears to the utmost to hear the rest; but the voices had sunk too low now to catch a sound. Even as she did so, another voice, far more distinct, from a lady in front, caught her attention with the name 'Miss Challoner.' Winifred pricked up her ears incontinently. Could it be of her Elsie that those two were talking?

'Oh yes,' the second lady addressed made answer cheerfully; 'she was very well when we last saw her in April at San Remo. We had the next villa to the Relfs on the hillside, you know. But Miss Challoner doesn't come to England now; she was going as usual to St Martin de Lantosque to spend the summer, when we left the Riviera. She always goes there as soon as the San Remo season's over.'

'How did the Relfs first come to pick her up?' the other speaker asked curiously.

'Oh, I fancy it was Mr Warren Relf himself who made her acquaintance somewhere unearthly down in Suffolk, where she used to be a governess. He's always there, I believe, lying on a mudbank, yachting and sketching.'

Winifred could restrain her curiosity no longer. 'I beg your pardon,' she said, leaning forward eagerly, 'but I think you mentioned a certain Miss Challoner. May I ask, does it happen by

any chance to be Elsie Challoner, who was once at Girtton? Because, if so, she was a governess of mine, and I haven't heard of her for a long time past. Governesses drop out of one's world so fast. I should be glad to know where she's living at present.'

The lady nodded. 'Her name's Elsie,' she said with a quiet inclination, 'and she was certainly a Girtton girl; but I hardly think she can be the same you mention. I should imagine, indeed, she's a good deal too young a girl to have been your governess.'

It was innocently said, but Winifred's face was one vivid flush of mingled shame and humiliation. Talk about *beauté du diable* indeed; she never knew before she had grown so very plain and ancient. 'I'm not quite so old as I look, perhaps,' she answered hastily. 'I've had a great deal to break me down. But I'm glad to learn where Elsie is, anyhow. You said she was living at San Remo, I fancy?'

'At San Remo. Yes. She spends her winters there. For the summers, she always goes up to St Martin.'

'Thank you,' Winifred answered with a throbbing heart. 'I'm glad to have found out at last what's become of her.—Mrs Barton, if you can tear yourself away from Dr and Mrs Tyacke, who are always so alluring, suppose we go up-stairs now and look at the pictures.'

In the studio, Warren Relf recognised her at once, and with much trepidation came up to speak to her. It would all be out now, he greatly feared; and Hugh would learn at last that Elsie was living. For Winifred's own sake—she looked so pale and ill—he would fain have kept the secret to himself a few months longer.

Winifred held out her hand frankly. She liked Warren; she had always liked him; and besides, Hugh had forbidden her to see him. Her lips trembled, but she was bold, and spoke. 'Mr Relf,' she said with quiet earnestness, 'I'm so glad to meet you here to-day again—glad on more than one account. You go to San Remo often, I believe. Can you tell me if Elsie Challoner is living there?'

Warren Relf looked back at her in undisguised astonishment. 'She is,' he answered. 'Did my sister tell you so?'

'No,' Winifred replied with bitter truthfulness. 'I found it out.' And with that one short incisive sentence, she moved on coldly, as if she would fain look at the pictures.

'Does—does Massinger know it?' Warren asked all aghast, taken aback by surprise, and unwittingly trampling on her tenderest feelings.

Winifred turned round upon him with an angry flash. This was more than she could bear. The tears were struggling hard to rise to her eyes; she kept them back with a supreme effort. 'How should I know, pray?' she answered fiercely, but very low. 'Does he make me the *confidante* of all his loves, do you suppose, Mr Relf?—He said she was in Australia.—He told me a lie.—Everybody's combined and caballed to deceive me.—How should I know whether he knows or not? I know nothing. But one thing I know: from my mouth at least he shall never, never, never hear it.'

She turned away, stern and hard as iron. Hugh had deceived her; Elsie had deceived her. The

two souls she had loved the best on earth! From that moment forward, the joy of her life, whatever had been left of it, was all gone from her. She went forth from the room a crushed creature.

How varied in light and shade the world is! While Winifred was driving gloomily back to her own lodgings—solitary and heart-broken, in Mrs Bouverie Barton's comfortable carriage—revolving in her own wounded soul this incredible conspiracy of Hugh's and Elsie's—Edie Relf and her mother and brother were joyfully discussing their great triumph in the now dismantled and empty front drawing-room at 128 Bletchingley Road, South Kensington.

'Have you totted up the total of the sales, Warren?' Edie Relf inquired with a bright light in her eye and a smile on her lips; for the private view—her own inception—had been more than successful from its very beginning.

Warren jotted down a series of figures on the back of an envelope and counted them up mentally with profound trepidation. 'Mother,' he cried, clasping her hand with a convulsive clutch in his, 'I'm afraid to tell you; it's so positively grand. It seems really too much.—If this goes on, you need never take any pupils again.—Edie, we owe it all to you.—It can't be right, yet it comes out square. I've reckoned up twice and got each time the same total—Four hundred and fifty!'

'I thought so,' Edie answered with a happy little laugh of complete triumph. 'I hit upon such a capital dodge, Warren. I never told you beforehand what I was going to do, for I knew if I did, you'd never allow me to put it into execution; but I wrote the name and price of each picture in big letters and plain figures on the back of the frame. Then, whenever I took up a person with a good, coinly, solvent expression of countenance, and a picture-buying crease about the corners of the mouth, to inspect the studio, I waited for them casually to ask the name of any special piece they particularly admired. "Let me see," said I. "What does Warren call that? I think it's on the back here." So I turned round the frame, and there they'd see it, as large as life: "By Stormy Seas—Ten Pounds;" or, "The Haunt of the Sea-Swallows—Thirty Guineas." That always fetched them, my dear. They couldn't resist it.—Warren, you may give me a kiss, if you like. I'll tell you what I've done: I've made your fortune.'

Warren kissed her affectionately on the forehead, half abashed. 'You're a bad girl, Edie,' he said good-humouredly; 'and if I'd only known it, I'd certainly have taken a great big cake of best ink-eraser and rubbed your plain figures all carefully out again.—But I don't care a pin in the end, after all, if I can make this dear mother and you comfortable.'

'And marry Elsie,' Edie put in mischievously.

Warren gave a quiet sigh of regret. 'And marry Elsie,' he added low. 'But Elsie will never marry me.'

'You goose!' said Edie, and laughed at him to his face. She knew women better than he did.

And all this while, poor lonely Winifred was rocking herself wildly backward and forward in Mrs Bouverie Barton's comfortable carriage, and muttering to herself in a mad fever of despair: 'I

could have believed it of Hugh; but of Elsie, of Elsie—never, never!'

CHAPTER XXXIV.—THE STRANDS DRAW CLOSER.

'I feel it my duty to let you know,' Sir Anthony Wraxall wrote to Hugh a day or two later—by the hand of his amanuensis—'that Mrs Massinger's lungs are far more seriously and dangerously affected than I deemed it at all prudent to inform her in person last week, when she consulted me here on the subject. Galloping consumption, I regret to say, may supervene at any time. The phthisical tendency manifests itself in Mrs Massinger's case in an advanced stage; and general tuberculosis may therefore on the shortest notice carry her off with startling rapidity. I would advise you, under these painful circumstances, to give her the benefit of a warmer winter climate; if not Egypt or Algeria, then at least Mentone, Catania, or Malaga. She should not on any account risk seeing another English Christmas. If she remains in Suffolk during the colder months of the present year, I dare not personally answer for the probable consequences.'

Hugh laid down the letter with a sigh of despair. It was the last straw, and it broke his back with utter despondency. How to finance a visit to the south he knew not. Talk about Algeria, Catania, Malaga! he had hard enough work to make both ends meet anyhow at Whitestrand. He had trusted first of all to the breakwater to redeem everything: but the breakwater, that broken reed, had only pierced the hand that leaned upon it. The sea shifted and the sand drifted worse than ever. Then he had hoped the best from *A Life's Philosophy*; but *A Life's Philosophy*, published after long and fruitless negotiations, at his own risk—for no firm would so much as touch it as a business speculation—had never paid the long printer's bill, let alone recouping him for his lost time and trouble. Nobody wanted to read about his life or his philosophy.

Of Winifred's health, Hugh thought far less than of the financial difficulty. He saw she was ill, decidedly ill, but not so ill as everybody else who saw her imagined. Wrapped up in his own selfish hopes and fears, never really fond of his poor small wife, and now estranged for months and months by her untimely discovery of Elsie's watch, which both he and she had entirely misinterpreted, Hugh Massinger had seen that frail young creature grow thinner and paler day by day without at any time realising the profundity of the change or the actual seriousness of her failing condition.

He went out into the drawing-room to join Winifred. He found her lying lazily on the sofa, pretending to read the first volume of Besant's last new novel from Mudie's. 'The wind's shifted,' he began uneasily. 'We shall get it warmer, I hope, soon, Winifred.'

'Yes, the wind's shifted,' Winifred answered gloomily, looking up in a hopeless and befogged way from the pages of her story. 'It blew straight across from Siberia yesterday; to-day it blows straight across from Greenland.'

'How would you like to go abroad for the winter, I wonder?' Hugh asked tentatively, with

some faint attempt at his old kindliness of tone and manner.

His wife glanced over at him with a sudden and strangely suspicious smile. 'To San Remo, I suppose?' she answered bitterly.

She meant the name to speak volumes to Hugh's conscience; but it fell upon his ears as flat and unimpressive as any other. 'Not necessarily to San Remo,' he replied, all unconscious. 'To Algeria, if you like—or Mentone, or Bordighera.'

Winifred rose, and walked without one word of explanation, but with a resolute air, into the study, next door. When she came out again, she carried in her two arms Keith Johnston's big Imperial Atlas. It was a heavier book than she could easily lift in her present feeble condition of body, but Hugh never even offered to help her to carry it. The day of small politenesses and courtesies was long gone past. He only looked on in mute surprise, anxious to know whence came this sudden new-born interest in the neglected study of European geography.

Winifred laid the Atlas down with a flop on the five o'clock tea-table, that staggered with its weight, and turned the pages with feverish haste till she came to the map of Northern Italy. 'I thought so,' she gasped out, as she scanned it close, a lurid red spot burning bright in her cheek. 'Mentone and Bordighera are both of them almost next door to San Remo.—The nearest stations on the line along the coast.—You could run over there often by rail from either of them.'

'Run over—often—by rail—to San Remo?' Hugh repeated with a genuinely puzzled expression of countenance.

'Oh, you act admirably!' Winifred cried with a sneer. 'What perfect bewilderment! What childlike innocence! I've always considered you an Irving wasted upon private life. If you'd gone upon the stage, you'd have made your fortune; which you've scarcely succeeded in doing, it must be confessed, at your various existing assorted professions.'

Hugh stared back at her in blank amazement. 'I don't know what you mean,' he answered shortly.

'Capital! capital!' Winifred went on in her bitter mood, endeavouring to assume a playful tone of unconcerned irony. 'I never saw you act better in all my life—not even when you were pretending to fall in love with me. It's your most successful part—the injured innocent:—much better than the part of the devoted husband. If I were you, I should always stick to it.—But it's very abrupt, this sudden conversion of yours to the charms of the Riviera.'

'Winifred,' Hugh cried, with transparent conviction in every note of his voice, 'I see you're labouring under some distressing misapprehension; but I give you my solemn word of honour I don't in the least know what it is you're driving at. You're talking about somebody or something unknown that I don't understand. I wish you'd explain. I can't follow you.'

But he had acted too often and too successfully to be believed now for all his earnestness. 'Your solemn word of honour!' Winifred burst out angrily, with intense contempt. 'Your solemn word of honour, indeed! And pray, who do you think believes now in your precious word or your

honour either?—You can't deceive me any longer, thank goodness, Hugh. I know you want to go to San Remo; and I know for whose sake you want to go there. This solicitude for my health's all a pure fiction. Little you cared for my health a month ago! Oh no, I see through it all distinctly. You've found out there's a reason for going to San Remo, and you want to go for your own pleasure accordingly.'

An idea flashed sudden across Hugh's mind. 'I think, Winifred,' he said calmly, 'you're labouring under a mistake about the place you're speaking of. The gaming tables are not at San Remo, as you suppose, but at Monte Carlo, just beyond Mentone. And if you thought I wanted to go to the Riviera for the sake of repairing our ruined estate at Monte Carlo, you're very much mistaken. I wanted to go, I solemnly declare, for your health only.'

Winifred rose, and faced him now like an angry tigress. Her sunken white cheeks were flushed and fiery indeed with suppressed wrath, and a bright light blazed in her dilated pupils. The full force of a burning indignation possessed her soul. 'Hugh Massinger,' she said, repelling him haughtily with her thin left hand, 'you've lied to me for years, and you're lying to me now as you've always lied to me. You know you've lied to me, and you know you're lying to me. This pretence about my health's a transparent falsehood. These prevarications about the gambling tables are a tissue of fictions. You can't deceive me. I *know* why you want to go to San Remo!' And she pushed him away in disgust with her angry fingers.

The action and the insult were too much for Hugh. He could no longer restrain himself. Sir Anthony's letter trembled in his hands; he was clutching it tight in his waistcoat pocket. To show it to Winifred would have been cruel, perhaps, under any other circumstances; but in face of such an accusation as that, yet wholly misunderstood, flesh and blood—at least Hugh Massinger's—could not further resist the temptation of producing it. 'Read that,' he cried, handing her over the letter coldly; 'you'll see from it why it is I want to go; why, in spite of all we've lost and are losing, I'm still prepared to submit to this extra expenditure.'

'Out of *my* money,' Winifred answered scornfully, as she took the paper with an inclination of mock-courtesy from his tremulous hands. 'How very generous! And how very kind of you!'

She read the letter through without a single word; then she yielded at last, in spite of herself, to her womanly tears. 'I see it all, Hugh,' she cried, flinging herself down once more in despair upon the sofa. 'You fancy I'm going to die now; and it will be so convenient, so very convenient for you, to be near her there next door at San Remo!'

Hugh gazed at her again in mute surprise. At last he saw it—he saw it in all its naked hideousness. A light began gradually to dawn upon his mind. It was awful—it was horrible in its cruel Nemesis upon his unspoken crime. To think she should be jealous—of his murdered Elsie! He could hardly speak of it; but he must, he must. 'Winnie,' he cried, almost softened by his pity for what he took to be her deadly and terrible

mistake, 'I understand you, I think, after all. I know what you mean.—You believe—that *Elsie*—is at *San Remo*.'

Winifred looked up at him through her tears with a withering glance. 'You have said it!' she cried in a haughty voice, and relapsed into a silent fit of sobbing and suppressed cough, with her poor wan face buried deep once more like a wounded child's in the cushions of the sofa.

AURICULA CULTIVATION.

For some years back the cultivation of this fascinating flower has been spreading, and the recent formation of the Scottish *Primula* and *Auricula* Society will give a greater impetus to the pure and health-giving recreation. A few plain and simple directions for the successful management of this sweet and beautiful flower may not be amiss, seeing that it is in many cases not so well grown as it might and could be, if its wants were better understood. Many cultivators, too, lose valuable plants during the winter. This need not be; a very little care and a little knowledge would prevent such losses.

As I have said, the care needed is very little; but that little must be given, as these flowers are sensitive, and will be sure to resent neglect or ill treatment. I have cultivated this beautiful flower for many years, and never lost one that came to me in a healthy state; but when they did not come in that state, I have seldom been able to bring them round again. I will now give a few directions, which will enable any one to cultivate this simple beauty to something like perfection, premising, however, that I write for those not well up in plant culture, and so will be more anxious to write plainly than to write finely.

First, then, the pots in which they are grown should be small, and that for three good reasons. In the first place, the plants are more easily kept in health in such pots; in the second place, they look far better, for no one with an eye for proportion likes to see a small plant in a big pot; and lastly, they take up less room. For plants of full average size, four-inch pots will do quite well; while for those under the average, three-inch pots will be ample. A few very strong growers, if in perfect health, will need five-inch pots. Next comes the drainage, which should be perfect. Into the bottom of a thoroughly clean and dry pot put, first, a potsherd large enough to cover the hole; then pack all round it other bits as close to each other as you can; then, on these put smaller bits over any open spaces, finishing with a good sprinkling of bits the size of peas or so. Over all, press some clean moss, thus forming a filter, which allows the superfluous water to escape, and at the same time prevents any particles of soil being carried in to choke the drainage, which would result in the soil becoming sour and unhealthy. For the compost: it should consist of good loam from rotten turf, and very rotten manure. A safe proportion is two parts loam and one manure, to which add a good dash of clean sharp sand. Those who have not much experience in watering might with great advantage add one-fifth part of wood-charcoal in lumps from the size of peas to that of broad beans. As to the state of the soil: it should not be clammy or very

dry, but to the dry side, and friable, with plenty of fibre in it, and not too fine.

Re-potting may be done any time from the middle of June to September. The first-mentioned month is the best, because it gives the plants time to fill their pots with roots before winter sets in, a matter of the greatest importance.

In potting, take the plant to be operated upon, turn it out of its pot, and shake away all the old soil. As the auricula plant grows older, the lower leaves keep dying off, and if left alone, would in time form a long bare stem. To prevent this, the plant, at every re-potting, is sunk up to the lower leaves; and it is from this new part, so sunk, that the best roots will be produced for the support of the plant next year. But the stem thus buried if let alone would soon get to be of an inconvenient length; hence the lower part should be cut off with a sharp knife; and if all has gone well with the plant since last re-potting, abundance of fine healthy white roots will remain on the upper part. Putting some of the compost into one of the prepared pots, press it moderately with the ends of your fingers; heap some more in the centre in the form of a mound, on the top of which set your plant, adjusting the roots all round the sloping sides. As many of the fibres as possible should touch the sides of the pot; and if they happen to be too long to be thus adjusted without doubling them up, trim them to the proper length with a sharp knife, then put in some soil evenly and firmly all round. If this operation has been properly performed, the lower leaves of the plant will be level with the surface of the soil, and half an inch or a little more will be left between that and the top of the pot, to hold water.

As this is supposed to be your first trial at auricula potting, you may have sunk the plant too deep, or not deep enough. In that case, just do it over again; and this first experience will have taught you to do all the rest right without more ado. I do not water my plants immediately after re-potting, but put them into the frame, shut them close, and keep them well shaded. If they do not require water for eight days or more, all the better. But the soil must not be allowed to get very dry, and when the necessity for watering arises, it must be done thoroughly. To make sure of this, two applications will be necessary, allowing an interval of a few hours between. After this thorough first watering, one application will be enough each time it is needed.

With regard to watering, it is curious to note the erroneous notions many people have about it. A lady will sometimes ask me: 'Gardener, when should I water my plants?' Another one will say: 'I had a most beautiful plant which I bought at a nursery, and though I gave it plenty of water every day, it died.' Not long since, one of the most amiable gentlemen I have ever met, said to me: 'My plants are not looking so well to day; I think I must have given them too much water yesterday.'

If the soil in the pots is of the right texture and the drainage in proper order, and if the plant needs water, too much cannot be given at one application. The pots must be filled to overflowing, so as to make sure that the whole soil is thoroughly moistened; the superfluous water will

escape by the drainage. But if a plant often gets water when it does not need it, it will result in injury. A plant should be watered just when it requires it, and at no other time. The careful cultivator will learn to know the time sooner than he thinks. From time to time examine the soil in the pots, and if it be found to be neither wet nor dry, but in a state between the two, watering will only do harm. But as soon as the surface looks a little dusty-like, water will be required.

In giving directions for re-potting, I forgot to speak about the offsets, or young plants, which will be found growing on the stem of the old plant. These are taken off with a sharp knife, all but the very small ones—which perhaps had better remain on till next year—and laid aside among damp moss, each sort by itself, and properly tallied. If there happens to be any large ones with good roots, they may be put into small pots at once. The most of them, however, will be small, and have hardly any roots, in which case, proceed as follows: Prepare a number of four-inch pots; fill them with the ordinary potting soil; then take a wooden pin as thick as your finger, and make from three to six holes in the soil close to the side of the pot. Fill these holes with moist sand; in this sand make holes with a smaller pin, and in these insert the offsets, close to the side of the pot, the larger ones three in a pot, five or six in the small ones. This plan is much better than putting them singly into smaller pots; they root quicker, and make good plants in a shorter time. As in the case of the older plants, keep from watering as long as possible, also keep close, and shade from the sun. This shading and shutting-up close is to prevent evaporation from the foliage, which would cause the plants to flag, a thing to be avoided. It is a good plan, on calm clear evenings, after the sun is off the frame, to pull the sash off altogether, and let it remain so till bedtime. On such evenings, dew will form on the plants, and refresh them greatly. The sash must, however, be put on again before retiring for the night, as no one can tell what sort of weather it may be before morning.

After receiving their first watering, the plants should get air night as well as day, little at first, but gradually increasing it until they are able to stand a full supply. I would, however, caution all who are ambitious to grow this lovely flower well, that it will not stand wind or bear strong sunshine. If the frame can be set in a situation where the sun will shine on it up to nine in the morning, and no more that day, it will be well. If set in a sunny place, it must be shaded with some light material not too closely woven. This shading may be put on or off according to the state of the weather, if the grower is always at hand and has time to do it. Otherwise, it may be fastened on in February and not taken off till October. In winter, the plants will be the better of all the sunshine they can get.

The auricula fancier who is determined to go into the matter with spirit will have a frame made for the proper keeping of his favourites. One to hold a hundred plants will measure three feet from back to front, and six feet the other way, and it may be four feet high at the back, and two and a half in front. Such a frame may have seven shelves, each five inches wide, rising from front to back in conformity with the slope of the glass, and

sixteen inches from it. The sash of a frame like this is commonly hinged at the top, and can be propped up to allow the plants to be easily attended to. It is obvious, however, that danger would attend raising such a sash during wet stormy weather; and as, even then, a free circulation of air among the plants is highly desirable, other means of attaining that end must be resorted to. It is done as follows: In front of the frame is a ventilator four inches wide, and running the whole length. It is four inches from the ground, and is hinged on the under side, so that, when opened, it falls down of itself, and gives no more trouble. Wind and rain blowing in at this opening can do no harm, as it is under the level of the stage. A similar contrivance is also needed at the back, near the top; but in this case the opening, in addition to the hinged shutter, must be protected by having a strip of perforated zinc fastened over it on the inside.

THE SILVER STREAM.

AN IDYL OF THE WYE.

IN FOUR CHAPTERS.—CHAP. III.

On the morning following, before Pencraig was awake, Colonel Scobell had fished his favourite stream, aided and abetted by the gardener's boy, a precocious youth, intended eventually for a naturalist or a poacher, as the gods decreed, and succeeded in catching three fish. The three shining monsters were carried up to the house in triumph, and laid on a stone in the dairy, where a well-attended levee was held till breakfast-time. So delighted was the Colonel with this unique accomplishment, that in the exuberance of his joy he proposed a picnic down the river in honour of the occasion. Mrs Scobell, always most happy when her spouse was pleased, fell in with this arrangement. There was not a particularly large gathering at the early breakfast, consisting of the Moffat girls and our trio, concluding with Du Maurier, who had not yet broken the direful tidings of his premature departure. Miss Rashleigh did not put in an appearance.

'We will go to Ross by water,' Mrs Scobell explained. 'When we reach there, we will decide what further to do.—Mr Denton, I am told you are a capital hand at arranging these little matters. Will you help me?'

Denton laid down his knife and fork, and regarded his hostess with a look in which bewilderment and reproach were amusingly blended. With Malvolio, he felt he had greatness thrust upon him. 'My dear madam, some one has libelled me cruelly. Would you be surprised to hear that I never attended such a function in my life?'

'Oh, in that case we must go,' said the hostess good-naturedly. 'How many shall we be? There will be four of us—all you girls, with Mr Du Maurier—no fewer than seventeen altogether.'

'The invasion of Ross,' said Denton with a forlorn air. 'What a sensation we shall create! The army of Pencraig, under the command of Colonel Scobell.—Du Maurier, these knickerbockers of yours will cause a *furor*.'

The gallant Frenchman smiled, but without his usual airy assurance. He was by no means at ease, though he was somewhat grateful to Denton

for the opportunity afforded. 'It is a great disappointment, no doubt,' he said; 'but I shall not be there. I have important business calling me to town, and I shall be compelled to go to Hereford to-day. My charming hostess will forgive this unavoidable termination to the pleasantest of visits; but, ah! the stern calls of business; I shall be forced to take my leave early to-morrow.'

Phil looked up at the speaker, whose eyes were fixed upon him in a questioning manner, and nodded shortly. So long as the fascinating Horace would not be present at the fête, it was a matter of little moment whether he remained at Pencraig another night or not. This decision was none the less satisfactory because Phil had no intention of going himself. He had a little work to do, and a great deal to think about. He also had a clue in his hands, which, skilfully handled, would put an end to the painful coldness between Beatrice and himself. As he sat upon the terrace smoking a matutinal cigarette, Denton with a face of woe joined him.

'The die is cast!' he said. 'We are to go into Ross; though what we are going to do there is a social problem beyond ordinary understanding. I believe there is a fine church there, where we shall spend the customary ten minutes. What follows, I shudder to contemplate.'

'What a humbug you are!' Phil retorted. 'Just as if you won't enjoy yourself as well as the rest of them. I know what the programme will be, well enough. You will go down to Ross, taking care that you and Bertie pull the gig pair with Gwen and Nellie Moffat.'

'Not a bad idea,' said Denton, as if such a plan had been furthest from his thoughts. 'We have only to drop a hint to some of the women that the gig is not quite safe, and the thing is done.—Now, as to yourself?'

'I shan't go—at least I don't think so. I—I have some particular work to do. Only leave me that little oak dingey for this afternoon. I dare say I shall find time for a pull up to Hoarwithy and back.'

Denton whistled softly; he was too much a man of the world to inquire the reason for this unexpected determination.

'We shall be rather short of the nobler sex, in that case. Rashleigh cannot favour us with his desirable company; we shall mourn the absence of Horace the incomparable in silent despair.—What's to be done?'

But the unexpected arrival of three Oxford undergraduates, who had rushed over from Hereford owing to the collapse of a cricket match, satisfactorily solved the problem. The party resolved itself into a smaller one than had been at first anticipated, and as a matter of fact the limited number of floating craft rendered this imperative. It was past eleven before the three boats got under way and slid gradually out of sight round the bend. Phil stood upon the tiny wooden pier watching them, and smiling at the brilliant diplomacy of Denton's, which had been attended by triumphant success. He was not quite alone, for Miss Edith Moffat stood by his side, an unmistakable pout disfiguring her pretty lips.

'It is too bad!' she exclaimed, with tears in her voice. 'I am always left out.'

'Then why didn't you say you wanted to go?' asked Phil with scant sympathy. 'There was plenty of room in our boat.'

An April smile darted across Miss Edith's piquant little face, a saucy smile of meaning. 'There are *four* of them there, you know. And besides I heard Mr Trevor say the boat was not quite safe. Wasn't it brave of Nell and Gwen to risk such horrible danger?'

'Very,' said Phil dryly. 'You are naturally a courageous family. Still, if you can put up with such a commonplace cavalier as me, we will have a long pull this afternoon.'

'Delightful!—Only, there isn't a boat.'

'Oh, I took care of that. There is plenty of room in the little dingey, if you only sit still, and exactly in the centre. You and I will go as far as Hoarwithy directly after luncheon, and get back in time for dinner.'

Miss Edith looked up at the deep blue sky above the larch tassels, then down again to the swift running river, musical as it rushed over the brown pebbles. She gazed seriously out of her great eyes at her companion, as if she would read his thoughts. 'I wonder what you stayed behind for?' she asked abruptly.

'Now, I suppose that is what a woman would call gratitude.—My dear Edie, have you so soon forgotten the moral precepts of your school-mistress? But seriously, I have something important to do this morning. Don't ask me any questions, there is a good child.'

'I am very sorry, Phil,' Miss Edith replied with humility. 'If you would only let me help you a little. I—I understand that you'—

'You are a good little girl, and I am very grateful.—No; you can't help me, little one. I hope everything will come right in a few days. When it does, you shall be the first to know.'

Philip Decie was not the kind of man to make a confidant of any one; but the quick warm-hearted sympathy had touched him more deeply than he cared to own. Moreover, it was not like confiding in a stranger, for the girl had been an especial favourite of his ever since he had first known her an imperious little beauty aged seven. There had always been something in the frank innocence of her great gray eyes that drew him towards her, child as she was, as one noble nature is attracted by another. After this little interchange of sympathy, it came almost like a shock to Phil when he encountered Du Maurier strutting along the terrace, smoking one of his everlasting scented cigarettes.

The Frenchman's colour rose as he saw Decie approaching. He bore the air and manner of one who conquers his pride to ask a favour of an unrelenting and implacable enemy. 'You will recollect our little conversation of last night?' he asked.

'Um! I don't think it is likely either of us will forget it. Still, your memory seems to have proved somewhat treacherous. I made a certain stipulation as regards the duration of your stay here.'

'Which is precisely what I am going to mention,' Du Maurier exclaimed. 'I found it was impossible.'

'Impossible?' Phil returned, his face darkening. 'As for that'—

'Nay; hear me out, my impetuous friend. It

was impossible for me to go to-day, for the simple reason that I had not the means of taking myself away from here. Yesterday, I sent a telegram to a friend, who can and will refuse me nothing'—

'Blackmail, probably,' Phil interrupted.—'Go on.'

'It matters not to you,' continued the Frenchman, with a flash of his glittering eyes, 'so long as this remittance comes. I go into Hereford this afternoon to get my letter, which shall wait for me at the bureau. But to-morrow mid-day shall see me gone.'

'I do not wish to be hard upon you,' said Phil, with a slight feeling of compunction. 'Neither did I seek this information. Still, I am satisfied.'

Du Maurier watched his rival as he turned away. His long thin fingers were tightly clenched, the cigarette in his mouth was crushed between the even white teeth in silent impotent consuming rage.

'*Ma foi*, but it is a fine thing to be one of these English aristocrats,' he said with a deep respiration. 'So cool, so contemptuous! I would give all I possess to have my gentleman on a nice level strip of turf with twelve paces between us. Still, I have my little revenge. La belle Rashleigh is proud; her self-respect is wounded. If it is not Horace Du Maurier, it will never be M'sieu Decie.—Ah! if it had not been for those bills!'

The dark scowl upon the Frenchman's face gradually changed to a sour smile. He rejoiced in a cat-like nature, only capable of those petty meannesses which make up the *summum bonum* of some men's lives. He looked at his watch, and finding it close upon twelve, set out with apparent determination of purpose across the fields. As he came into the high-road at some distance beyond, there was another individual awaiting him—Gerard Rashleigh. From the expression of the young undergraduate's face, the interview was neither self-sought nor pleasing.

'Ah, I thought you would not keep me waiting,' said Du Maurier. 'One cannot be too careful in a house like Pencraig, where no place is sacred against intrusion.—In one word, have you the money?'

'Money? Where can I get it from? It was only yesterday morning that you promised me another month.'

'Possibly, dear boy; only, this is a case what you call Hobson's choice. Many things have happened since yesterday. Your friend Decie—to put it plainly—insists upon my leaving Pencraig to-morrow.'

'You don't mean that!' Rashleigh exclaimed, every vestige of colour gone from his cheeks. 'Under the circumstances he would not dare!—'

'He has dared, all the same; and I shall have to obey. See how one suffers for the little indiscretions of youth. It's hard upon me.'

'What particular rascality has Decie got hold of?' Rashleigh asked bluntly.

'I do not like that word, sir, and I will ask you to be careful. Still, as the poet says, *Arcades ambo*!—'

'*Id est*—blackguards both,' Rashleigh finished. —'Oh, why be nice about expressions, particularly when they are true! I wish to heaven I had never seen you. I wish—— But what is the

use of wishing? I am anxious to pay you this money; but I haven't got it, and that's the long and short of it. Some day, I shall make a clean breast of the whole thing.'

But Du Maurier was too familiar with these transient fits of repentance to be seriously alarmed; he merely laughed again and lighted another cigarette. 'It will be a black day for you when you defy me,' said he. 'You and I sink or swim together. If you wish to return to your buttercups and daisies, I shall not hinder you. Pay me four hundred pounds and you are free.'

'I haven't four hundred pence,' Rashleigh replied doggedly.

'Perhaps not; but I will show you how to get it. Let us take a long walk; it will soothe your nerves and clear your brain. And besides, I am going to show you the way to rid yourself of Horace Du Maurier, who, after all, is no greater scamp than you; only, he has the pluck, and you are a coward.'

The complacent hostess of Pencraig, who had not joined the Ross excursion, saw no objection to Decie's proposal for the afternoon. It was not often that the good lady had a long afternoon in peace, and the chronicles of the *Little Lord Fauntleroy* were of overpowering interest.

'My dear child, so long as you come home alive, you may do just what you please,' she said. 'Phil was always most trustworthy, even as a boy, and I am sure you will be safe with him.'

There was not a ripple on the water as the little craft left the landing-stage and took its way up-stream. Miss Edith sat with the crimson tiller-ropes over her shoulders, looking over the shining river before her from under the shade of a smart sailor hat with a truly nautical air. It was so quiet and pleasant there beneath the overhanging willows, and along through cool sombre shades cast by the trees in the sloping woods. There was just the rhythmic throb of sculls in the rowlocks, with tiny pools left by the sweeping blades.

'Now, don't you feel just as happy as if you had gone with the others?' asked Phil, when a mile or two had been covered. 'Probably by this time they are all hot and tired, and heartily wishing they had never met.'

'That is a slightly egotistical remark, Phil,' the fair coxswain observed; 'and I shall not pay you the compliment of replying. Besides, it is all very well to console yourself with sarcastic remarks, when you know that, under more favourable circumstances, I might have proved another Mariana of the Moated Grange for all you cared.'

'Um! A season in town hasn't improved you,' said Phil gravely. 'That's the worst of taking too much notice of very young ladies, they get so flippant.'

'Ah, but it isn't original,' said Edith serenely. 'I overheard much the same remark made in a London drawing-room one night; and the answer struck me as being so appropriate, that I remembered it—which is very creditable, and not a little risky, for I haven't the remotest notion who Mariana is.'

'Put it down to Tennyson or Shakespeare; it's sure to be one or the other.—Pull the

left-hand string; we shall be on the gravel in a minute.'

They had reached a broad bend in the river, where the stream widened, with low sloping meadows upon the one bank, and an eminence—upon which is situated the village of Hoarwithy—upon the other. At this point the stream takes a peculiar V shape, and is particularly puzzling to the amateur oarsman. Decie, pulling round sharply to miss the foreshore, struck the blade against a solid mass of rock and snapped it nearly off below the button.

'This is a pleasant thing,' he exclaimed ruefully.—'Will you get out and wait till the damage can be repaired, or stay here?'

Miss Edith treated this proposal with the scorn it merited. 'Get out? Certainly not.—There is at least four yards of mud between me and dry land.—No; you shall row me under that delightful shady alder, and fasten up. I don't suppose there will be any danger of my being spirited away till you return.'

Making the best of his broken implements, Decie succeeded at length in reaching the desired haven; and having fastened the dingey securely, scrambled up the bank with the fractured blade, though not without detriment to his spotless flannels, in search of the handy man, without which no village is complete. This individual, a bluff old fisherman in blue Guernsey frock and ducks, who combined the office of postman, publican, and carpenter to the village, expressed a cheery opinion of the damage. 'I can splice it as good as new in half an hour, your honour,' said he. 'You'd better step inside. And if you'll ask for the "strawberry Norman," you'll get as good a glass of cider as a man need wish to drink.'

As Phil knew both the man and his cider by reputation, he had no hesitation in taking the hint, though it is not always advisable to accept a west-countryman's dogmatic opinion upon this patriotic subject on every occasion. As Decie stood in the little bar alone, he was not a little astonished to hear from the room beyond, the door of which was only partially closed, the familiar voices of Du Maurier and Gerard Rashleigh. He was still more surprised to hear his own name so frequently mentioned.

'It's a blackguard thing to do,' Rashleigh exclaimed. 'I have done him harm enough already. I tell you I won't do it.'

'Not so loud: you don't want the whole parish to hear,' came the smooth seductive tones of the Frenchman. 'Surely, you would not scruple at such a little thing, after what you have already done.—Ah, that little yellow ticket was a masterpiece; a smooth touch so artful that it looked like nature itself. Now that Miss Rashleigh is convinced her lover is a thief!'

'Leave my sister out of it altogether,' Rashleigh exclaimed passionately. 'I tell you I won't have it. If it wasn't that I was afraid of you, I would tell Decie everything.—Why do you tempt me? It can do you no good.'

'It will give me revenge. But you have your alternative. To use one of your sweet insular phrases, the borrower is always the servant of the lender. Pay me what money you owe me, and my power is gone.'

'Would to heaven I could! There would be no hesitation then.'

'Decie would be delighted to accommodate you,' sneered Du Maurier. 'The paltry hundreds would be cheerfully paid, if you only cared to exercise this new and interesting fit of honesty. Why not ask him?'

'Because I have done him too much harm already. Because, if you must know, I am in his debt now. That bracelet affair'—

Decie, conscious for the first time that he was playing the part of an eavesdropper, stayed to hear no more. His face was very stern and set as he paid for the repair of the blade, and passed down the garden path with a curt 'Good afternoon' to the village genius.

'Seems as if he was upset,' remarked that worthy, 'and him so affable and perlit at first. Maybe missis ha' given he the "red streak" by mistake.'

For some minutes the boat was propelled towards Pencraig in silence. Miss Edith regarded her companion demurely from the unclouded serenity of her gray eyes. 'You are looking very amiable,' she observed in the sweetest tones. 'You must have heard some particularly good news; that is, if your hurry to get back is any criterion.'

'Do I look amiable?' said Decie with an effort—'more amiable than usual? I have heard something; but whether it is good or bad, for the life of me I can't tell.' And with this enigmatic remark Miss Edith was fain to be content.

EUCALYPTUS HONEY.

At a meeting of the Pharmaceutical Society in London, a sample of Eucalyptus Honey was shown, and created much interest from the fact of its containing all the essential properties of those invaluable trees. (See *Chambers's Journal*, March 26, 1881). The existence of this peculiar honey was made known in 1884 by a French traveller, Mr Guilmeth, who, while exploring the island of Tasmania, noticed at the summit of one of the eucalypts a peculiar formation, which appeared to him to be a gigantic gall. Having for some time examined it through his glass, he was much surprised to notice that it was frequented by a legion of small black bees, which swarmed around the 'gall' or hive as it was now revealed to him. A strong desire to possess this hive led him to order his native followers to cut down the tree, which had a girth of seven metres and a height of eighty metres. The men before beginning their work were well protected over the face and hands; while Mr Guilmeth retired to a safe distance, to watch the proceedings of the bees during the time the men were at their laborious work of sawing through this large tree. At first, no notice was taken of them; but as progress was made, the explorer was much interested and amused by the sight which met his gaze. A swarm of the bees flew down to within a few yards of the toilers, and after flying around for a time rapidly returned to the hive, their places being filled by others. This curious behaviour of the bees continued until the tree was sufficiently cut through to be pulled to the ground by ropes. When the tree was finally laid low, the men were instructed to drive away

the queen, and this they did after a deal of shouting and beating of utensils. They would have fared very badly had they not been well protected, for the bees greatly resented this interference with their home. The hive and several bees which had lingered were captured, and the honey collected. Upon tasting the honey, Mr Guilmeth, much to his surprise, found that it possessed the characteristic odour and flavour of the eucalyptus essences. This he thought so important a discovery as to lead him to forward a shipment of it to a French doctor in Normandy for examination.

Upon carefully inspecting the bees that had been captured, they were found to be of a species not known in Europe, and accordingly the name of *Apis nigra mellifica* was provisionally given to them. They were of a smaller size than the common bee of Europe, and quite black, with a far more developed proboscis. Experiments failed to acclimatise it in Algeria and in France. It is curious to note that in Algeria, where the eucalypts have been acclimatised, it was sought to obtain this honey by means of the Algerian bee. All flowering crops were cut down, and the bees forced to turn their attention to the eucalypts, with the result that the bees gradually died. To prevent a disaster, fresh flowering plants had to be imported. The eucalypts being biennial, this honey is only obtainable every two years; but it does not during that period lose any of its important constituents. It is of a deep orange colour, of a transparent sirupy consistence in warm weather; but in this country it is usually partly solidified. It has the characteristic odour of the eucalyptus essences, and also their flavour. It is said to contain about sixty-two per cent. of the purest sugar, and over seventeen per cent. of the essential constituents of the eucalyptus, consisting of eucalyptol, eucalyptene, cymol, and terpene, all of which play an important part in the therapeutics of the present day. It was thought that a similar honey could be obtained by mixing these ingredients; and experiments were tried in Paris, but without success, as it was found that the ingredients gradually separated and volatilised off.

Eucalyptus honey is designed to take an important place as a therapeutical agent and as an article of food, on account of the unusually large percentage of sugar it contains and of the presence of the eucalyptus essences, the properties of which as antiseptics and deodorisers are well known. It is usually given in warm milk or warm water. One or two teaspoonfuls twice or thrice daily have produced beneficial effects on bronchitis, asthma, and diseases of the lungs and respiratory organs, producing elasticity of the lungs and a decided increase of the vocal powers. The breath is said to be perfumed, and a sense of warmth and well-being to pervade the body.

The field for such an important honey would almost appear unlimited, owing to its antiseptic properties; and already cases have been recorded of its use in typhoid gastric infection, whooping-cough, and catarrhs. As a substitute for cod-liver oil, the advent of eucalyptus honey will be hailed with delight by all who have to undergo the nauseous experience of a course of this oil, while its nutrient powers are not thought to be inferior. Much interest was created a short time since by the chemical analysis of the famous Trebizond

honey, which produces narcotic effects upon all who take it, followed by strong excitement and toxic effects. It was carefully analysed in this country, and its ingredients when separated were tried physiologically upon animals with a two-fold object: firstly, to ascertain the nature of the poison; and secondly, to determine, if possible, by this means the species of plant the bees producing this honey frequented. The results thus obtained led the experimentalists to suspect a certain plant; and communications were made to friends residing in the districts whence this honey was sent as to the names of the plants mostly abounding in the neighbourhood. It was thus ascertained that the bees relied upon a poisonous plant for their honey.

There are now many honeys containing either toxic properties or peculiar odours, which have been traced to the bees frequenting a certain plant; for instance, the Narbonne honey owes its peculiar flavour to the rosemary, which grows so profusely in the neighbourhood. Another instance is that of the Mount Hymettus honey, which derives its flower and odour from the labiates.

With such facts before us, we should not be surprised to see our Australian brethren's example followed in this country, and apiaries started for the production of honey of a distinct flavour, odour, and effect.

BABY—BEER—BULLETS!

A WESTERN SKETCH.

SUCH, in display type, with staring capitals and exclamation points, was the heading of an article in the *Daily Denver News* issued on the morning of Monday, April 11, 1887.

Denver, it is well known, is the chief city between Chicago and San Francisco. It is the centre of a great mining and agricultural district; it is the meeting-point of a network of railways; it boasts a cathedral, a state-house, a population of between seventy and eighty thousand, and a climate which entitles it to the proud appellation of the 'Queen City of America.' Rather more than twenty years ago it was a mere mining camp, unknown save to miners and cattle-men. The reports of discoveries of fabulous rich minerals in the Leadville Hills ten years ago attracted the attention of the entire continent. Capital and emigration flowed towards Colorado, and Denver was transformed from a rude settlement into a goodly city, from a little coach-visited town into a world of rapid motion and rushing railways. The old order of things gave way before that great civiliser, the 'iron horse;' and the traveller of to-day finds it difficult to believe in the coach robberies of yesterday. London itself boasts not of better roadways, or of business houses more handsomely massive and solid in character. To a Cockney, to be sure, the glare and want of finish and harmony about the streets are not pleasant. To one who has been accustomed to move between the plain ripe old buildings of London, the advertisements and their 'uncommendable iteration' savour of vulgarity. But there is an air of bustle about the place, a ring of decision about the voices, a self-reliant

expression about the clear-cut American features, which tell of the healthy national business pulse which beats from the Atlantic to the Pacific.

It was Monday morning. I had arrived at Denver on the previous Sunday afternoon, on my way from New York to San Francisco. My desire to see western life, always great, had been 'fed fat' by my fellow-travellers. New York and its wonders had disappointed me: they were too much like London. Of my fellow-travellers, one was an American, whose angles had been rubbed off by intercourse with Europe; the other was an Englishman, the greater part of whose life had been spent in Arizona. George C. Warner, as the latter signed his cheques, had been led by circumstances to the West when the travelling was not to be accomplished with all the comfort to be obtained in a middle-class hotel. He did not profess to have been one of the pioneers of the West; but he had 'hoofed' the journey, and 'roughed' it when he reached his destination. His enterprise had been rewarded: he had made a fortune, and could now afford to travel like a millionaire. He was a good *raconteur*, and his voice, looks, and manner indicated a profound belief in all he said. Many and good were the stories with which he beguiled the hours after the novelty had worn off the journey, and when our clothes were saturated with alkali dust.

'I recollect once,' said Mr Warner, one evening when we were in the smoking-room, 'out in Ar'zona, bein' in a s'loon. We were just havin' dinner. There was a girl waitin' on us—you must know that girls ain't common in those parts—and the boys were pertickler fond o' her. Wal, a man came in and sat down just opposite one o' the "boys." The girl brought him some half-dozen dishes, and amongst 'em some beans.

"Tek these beans away; I don't eat beans," said the stranger, in a voice savouring of command. It may ha' been that the girl didn't hear him, or it may ha' been that she kind o' resented the tone in which the order was given. Anyway, she didn't take any notice, and the stranger repeated his order in a still more peremptory manner. The girl put out her hand to remove the unwished-for dish.

"Stop! He does eat beans," said a cowboy, whipping out a revolver and covering the newcomer. Click! went the hammer. "Stranger, if you don't get away wi' them beans, I'll make cold-meat of you." The stranger *did* eat the beans.

"Bring him another plateful." It was brought and eaten in silence. This was repeated until five platefuls had been disposed of. Then the revolver was returned to its place, and the "boy" remarked to his fellow-diners, in a tone half explanatory and half justificatory, but wholly decisive: "I warn't a-goin' t' have the little girl insulted, anyway; don't you forget it!"

I ventured to hint that refusal to eat the beans would probably not have been followed by a punishment altogether so disproportionate to the offence as that to which the cowboy's conduct pointed. But Mr Warner seemed hurt by the suspicion, and gave me a look so full of contempt of my opinion, pity of my ignorance, and surprise at finding any one sceptical as to the honesty of the 'boy's' intentions, that never afterwards have I allowed a doubt as to the veracity of Mr

Warner's stories to appear in my face, still less have I translated my doubts into words.

'Wouldn't have shot him! Great Scott! wouldn't he? Why, I've seen a man shot because he ate peas with a fork, down in Ar'zona,' said Mr Warner, with a look of righteous indignation from which there could be no appeal.

I really believe these things did happen 'down in Ar'zona.' But the explanation for many atrocities too dreadful to be here mentioned, I gathered, was to be found in the fact that owing to climatic influences—chiefly, of course, the want of water—insanity obtained amongst a startling proportion of the inhabitants of Arizona. The forms which insanity there took were dreadful. In that country, every bush had a thorn, every insect a sting, and every man a revolver and bowie-knife. One can conceive what dire use such weapons as the knife and revolver would be put to by madmen. Indeed, on no other theory can the diabolical deeds said to be done in Arizona be accounted for. There lynch-law took summary vengeance; insanity was not admitted as any justification; asylums there were none; mitigating circumstances were not, and could not be, taken into account. Rye-whisky assisted the pestilential climate to produce criminals, who, if taken red-handed, were killed on the spot without trial of any kind.

Revenons à nos moutons. I have said that I had arrived at Denver on the previous afternoon. I was driven to the *Windsor Hotel*, a most elegantly appointed hotel in the modern Gothic style, built of Colorado stone trimmed with granite. My room looked out upon Larimer Street, the principal business thoroughfare. The hotel is a five-story building, and contains upwards of three hundred rooms. Nearly the whole of the basement is occupied by a spacious hall, known as the 'rotunda,' in which the chief exchange business of the town and neighbourhood is conducted. The whole building is lighted by electricity and heated by steam. An electric button places a well-disciplined army of attendants at the command of the traveller; the table is supplied with a wealth of milk, cream, vegetables, and fruit from a model farm owned by the Denver Mansion Company; and the Turkish, Electric, Russian, and Roman baths, also under the same management, are supplied, as is the hotel, from an artesian well for which many health-giving properties are claimed. The wants of the pleasure-seeker or the traveller are all anticipated in this truly palatial building.

I was sitting at the window, absorbing the sentiment and observing the people. Everything was bathed in beautiful sunlight, sunlight as beautiful as that of Naples. The atmosphere was that of summer rather than spring, and so clear, that the snow-capped heights of the Rocky Mountains, distant fifty miles, showed a dazzling brightness against the azure sky. The trees were putting forth buds, and here and there a lawn was bright with grass of a vivid green. Everybody seemed to be in the streets, enjoying the open air in light hats and very light overcoats. There was an unmistakable atmosphere of prosperity about the place, and an odd mixture of city and of country life. On each side, between the broad roadway and the markedly clean footways, ran a little stream of water.

The repose was broken by a patrol wagon containing armed men. It dashed up the street, turned to the right, and was lost to my view. The bystanders roused themselves; some few followed, as they would have followed a fire-engine, but the greater number quietly went their way.

Baby—Beer—Bullets!—Baby Lost Sight of in Beer and Blood.—Here, then, was the solution of the mystery of the patrol wagon. Was there anything comic about it? Shortly, the story was this. The Polish quarter of the town had been the scene of a brutal drunken riot. A woman named Mrs Mary Klunder invited her friends to celebrate the christening of her eight months' old baby. With her husband she lived in one of a row of single-story frame tenement houses in the centre of a district inhabited by foreigners employed chiefly in the iron-works of the town. Before the time for christening arrived, many of the men were intoxicated. A quarrel began. Somebody drew a revolver and fired two shots. The whole company then joined in a free fight, which was put an end to by a police patrol armed with Winchester rifles, but not before one man had been killed and two others seriously wounded. Between twenty and thirty persons were arrested and placed in jail.

According to the leading daily of Denver, at the beginning of the row, officer Hart 'sailed in, but they piled upon him, and at the first shower of bricks he sailed out.' That which officer Hart failed to accomplish was performed by the patrol wagon, containing a lieutenant and about twenty Winchester rifles, with sufficient ammunition to use if necessary. The patrol party took about twenty prisoners, who, bespattered with blood, with their clothes torn, their faces and hands scratched, and their hair dishevelled, looked more like scarecrows eloped from a cornfield than men. To complete the picture, there was a rough sketch of the room (lit up by an illuminated card of *Home, Sweet Home*), in which the holes in the walls looked like so many black beetles, in which the chairs were all 'split into toothpicks,' and in which a most saintly looking person—intended, I believe, to represent the murdered man—was depicted as though saying his prayers to the last of a row of beer barrels. The whole thing might have been got up by the reporter who put a funeral under the heading 'Amusements' 'cause he got it up kind o' funny.

I went to see the prisoners in jail, and was present at their trial. The jailer was a negro. I complimented him with half a dollar and some tobacco; and with a bow and a grin he became my conductor. The prisoners were of the lowest type of humanity conceivable. Not one of them spoke a word of English. The Denverites complained, doubtless with justice, that their 'low-browed, brutal faces bespoke them to be of the lowest type of the foreigners who were shipped to that country to get them away from their native lands.' They were lodged in a structure called the 'bull-pen.' The jail consisted of a large chamber on the ground-floor of a handsome building which in England would be called a town-hall. The criminal court was on the first floor, and the rest of the building was set apart for public offices. There was nothing dungeon-like about the jail: it was light, and its furniture looked slight even

to frailty. The cells extended round the chamber. An iron partition divided one cell from another, and a gate of iron bars formed the front. In this case stone walls *did* a prison make, and iron bars a cage. No one had escaped, my conductor told me, but one man had been fetched out and lynched. Round the 'bull-pen,' which was a huge detached square cage in the centre, was a footway some six feet in breadth. The occupants of this den were amusing themselves in various ways. One was playing the part of a barber; thick and fast fell his comrade's locks as he ploughed away with a rusty pair of scissors which disdained to click. Some were taking their ease at full length on the straw; others were talking excitedly. They jabbered and gesticulated at me. My conductor interpreted this into a request for tobacco for chewing. At that time they were good-humoured and quiet. When first brought in they had been obstreperous; but a few buckets of water were thrown over them, and 'Lor' golly! them was quiet, you bet.'

They were brought up for trial on the Tuesday. No interpreter could be found, and for a time it looked as if nothing could be done. The prisoners were formed in a line which reached from one wall to the other. With their caps in their hands, they looked dazedly at the judge. The baby was in evidence, and, like Dickens's poor little consumptive, 'seemed to wonder what it was all about.' At length an interpreter was secured. The attempt to find out their names led to great confusion. The interpreter seemed almost as much at sea as the prisoners. The counsel for the prosecution was obliged to remind him that one of the prisoners had had four names, and it was ultimately decided to christen him 'Philip Flatlip.' Another prisoner was so loquacious that the interpreter was commanded to 'stop his talk.' By the time their names were ascertained, the judge was exhausted, and adjourned the inquiry for a week.

That evening I visited the theatre. Mrs Langtry played Lady Clancarty before an immense audience. The gentlemen of the gallery, who know a good thing when they see it, warmly applauded her sensational fall. In truth, it is the most startling fall ever seen upon the stage. And when, in the last act, she declared, clinging wildly to Mr Charles Coghlan, that 'her country was in her husband's arms,' there was a wild hurroo of delight, and a voice yelled, 'Bravo, miss!' Mr Coghlan was still more successful in 'holding the mirror up to nature,' and the Denver critic who insisted that the *feu sacré* did not burn within Mrs Langtry, admitted that Coghlan had genius—and genius is not lavishly dispensed by nature.

I left for San Francisco on the following morning. For me, the B. B. B. tragedy was over. I learned subsequently that one of the actors in it suffered the death penalty.

Yes, the romantic cowboy is gone. Gentle dry-goods men and dainty bank clerks march about under the cowboy's attractive headgear; but no one fears their fierceness; for, instead of a black muzzle under the hat, a tobacco-stained chin, their chins are 'new-reaped, and show like stubble-lands at harvest-home.' Yes, the broad-shouldered, black-moustached, generous highwayman, who killed the father and fell in love with the daughter, who preached better than the parson

and set bones better than the doctor, whose face none had ever seen, and at whose name travellers trembled—where is he? He is as much a thing of the past as Julius Cæsar. Civilisation is fatal to the growth of such beautiful children of nature, and extended knowledge renders belief in their existence impossible. They have gone into the limbo of the past; and the solitary horseman who is seen wending his way up the gulch is probably as peaceable as you or I.

FINDING WATER BY THE DIVINING ROD.

WITH reference to the paper on 'Modern Divination' which appeared in this *Journal* (February 18, 1888), we have received the following communications:

You may perhaps be surprised to hear that there are numbers of intelligent readers of your *Journal* that believe implicitly in the 'dowsing rod' for finding water, and that those readers include noblemen, gentlemen, parsons, bishops, officers of the army, engineers, magistrates, and others. The chief 'water-wizards' at present are John Mullens and Lawrence; and the first can, I know, furnish a volume of testimonials to his powers from parties such as I have named. John Mullens has operated in very many places in England, and as far north as Dundee and other places in Scotland. He belongs to the same county as Lawrence, is a working-mason on a gentleman's estate, and an unpretending honest man, who, if desired, sinks and builds his own wells, and charges nothing if the water is not found. He prefers to be employed after long droughts, as water found then, he reasonably concludes, will generally be from a permanent source. In wet seasons, he says 'there is water everywhere,' and the good springs are consequently worse to find. He has been employed here several times to find water, after much expense had been incurred with engineers and others, and has always been successful, although at first most of us doubted his powers. I have tested him in every possible way, and he has never failed. No one now hereabouts doubts his powers. The vicar was perhaps the most incredulous until he had tested the man thoroughly. What convinced him most being that when Mullens was asked to find water in his flower-garden, he set out accurately the running sewer from his house for a long distance—not a trace of which was discernible above ground, and which no one knew but the vicar. He did other work of the same kind at the mansion here, finding an old disused sewer, the existence of which was suspected, but, although searched for, could not be found.

He has been employed, I believe, on similar duties by the London authorities. He discovered our water-mains and branches here wherever he crossed them in the course of his journeys, greatly to the surprise of an engineer from Sheffield who constructed our reservoirs, and who followed John 'afar off' for several days. The same engineer afterwards confessed to the writer that he was puzzled; but he admitted the man's powers. Mullens used the hazel and thorn 'twig' only. No member of his family has the 'gift,' hence everything has to be done by himself. He asks

no assistance save a 'twig,' cut close by, and a lad to follow behind and put a peg in where he makes a mark with his heel. He charges his fare and a modest fee, and is willing to submit to any reasonable test. He does not profess to explain his power, knows little or nothing about science, and is rather illiterate. Not a few large breweries and manufactories owe their water-supply to him. He does not profess to find *still* water: it must be *running*. In the case of the water-mains here, the 'twig' turned up above the pipe in fields, woods, and highways where no sign of the ground having been disturbed appeared, the pipes having been long down, and no one knowing anything about their whereabouts but the waterman, and he depends on the map when he seeks them.

I do not attribute the man's gift to anything supernatural, but to natural causes not yet understood. That water can be found by the man in the way described, I have no doubt whatever; and I am equally sure he will confound any sceptic who tries him. Mullens says a 'twig' from a variety of trees will do, but the hawthorn and hazel are the most active; and the way the point whirls round in a moment above water is marvellous. The 'twig' is Y-shaped; and the man, holding a leg firmly in each hand and the point downwards, steps slowly forward, stooping. On one occasion I held one end of the 'twig,' where it projected through his hand, the vicar holding the other end, both firmly, Mullens simply holding it, but without the power to move it up or down, yet it whirled round as before, except where we held it, and consequently *twisted* the bark into wrinkles by the force it exercised.

Another correspondent writes: My attention having been drawn to your article upon the use of the divining rod in finding water, I beg to give you my experience upon the matter. About four years ago I was invited by a land-agent in a neighbouring parish to meet him and a man whom he had sent for from the neighbourhood of Bristol, who, he stated, could find water with a divining rod. At first, I decided I would not go on such a wild-goose chase as I thought it would turn out; but afterwards I changed my mind and went to meet them. The rod consisted of a small branch of white-thorn about eighteen inches long in the shape of the letter Y. When the man—who was a mason—tried to find water, he walked slowly over the ground claspings the rod firmly with both hands near to the forked branches; and when the branches moved upwards, he said there was a spring of water below, and gave his opinion as to the depth of it from the surface. I was sceptical about the rod, and thought he moved it by some sleight-of-hand; but in the course of the day I was convinced it was not so. We afterwards came to a small stream of water by the side of a road caused by a heavy shower of rain. I asked the man to test it. I took hold of the rod as well as himself, in order to prevent the stick from twisting about; but in crossing the water I could not stop it doing so. I then held it with a pair of pincers, which had the desired effect as regarded that portion of the rod, but not so with the forked branches; in twisting upwards, each branch was split in the middle of them.

I engaged the mason to look over an estate of which I had the management, and some por-

tion of which was short of water. I took him to some deep wells of which I knew the depth. He was able to tell me the depth within a few feet. We next proceeded to a farmyard where there was a short supply of water, and where I wished to sink a well. He fixed upon a place, and said there was water about sixty feet from the surface. This proved to be correct. Afterwards, I had a well sunk, and found a tolerable supply of water.

He was taken to two other parts of the estate where I was anxious to get a supply of water; but he could not find any there. I afterwards tested him with places where I knew there was water, first at a small spinney, when he immediately said: 'There is a large supply of water here and bubbling near the surface.' This was the case. A spring about fifty yards off, and which he could not see, as the trees intercepted his view, supplied this village with a constant supply of water. Afterwards we came to a field where water was conveyed by a drainage-pipe from a fishpond to the kitchen gardens. When the man crossed the field where the drainpipe was laid, the rod immediately twisted about. Lastly, he was taken to another pipe which was laid under the highway to convey water from a pump in the woodyard to the stables. When he crossed it, the rod twisted up.

INSECT TORMENTS OF BRAZIL.

INSECTS in all countries often possess an extensive power of annoyance greatly in contrast with their diminutive size. They appear to combine the maximum of effect with the minimum of effort in a very scientific fashion. Brazil is specially favoured with parasitic torments; and even if those who are to the manner born become case-hardened, the traveller from climes where insect-life is less offensive in its attacks, can never be wholly reconciled to his lot. Even the most generous of Christians harbours a revengeful spirit against his bloodthirsty but minute assailants, which are at once puny and powerful.

Take the bush-tick, for example. Of this diminutive monster there are three species, of which the largest is about three-quarters of an inch in diameter. We are told that this insect was known to the ancients; but it is very unlikely that they enjoyed its acquaintance. There are three varieties: *Ixodes ricinus*, *Ixodes plumbeus*, and *Ixodes reticulatus*. The Latin name was derived from its supposed resemblance to the ripe bean of the *Palma Christi*. The Brazilian name is *carrapato*; and when examined under a magnifying-glass, it is seen to be furnished with a weapon of offence in the form of a trident of teeth, which are serrated inwards. It has also three pair of legs, and each leg is provided with strong hooked claws. Enormous quantities of the eggs are laid upon the ground; and the young ones as they creep out climb up the plants and catch at any passing animal which brushes past, and fatten on it. When Mr H. W. Bates was in the highlands of Brazil, he had to devote an hour at the end of his daily rambles to picking off the carrapatos that clung to him by their incisive fangs. The infliction is so dreadful, that horses and cattle sometimes die from the exhaustion caused by the bites of these creatures, which settle in swarms.

The traveller soon has the appearance of a person suffering from shingles. Sometimes the attacks bring on ricinian fever, just as in Russia, people may suffer from pulchious fever. The rainy season kills many of the carrapatos, and they also fall a prey to the birds; and the cieriema, in particular, is never shot by the natives, because they know the value of its services in thinning the ranks of the multitudinous blood-sucking *Ixodes*.

Another insect torment of Brazil is the Jigger, or *Pulex irritans*, *Pulex subintrans*, *Pulex minimus*, *Pulex penetrans*. These interesting creatures make their home chiefly in the human foot, and hence are known to the Brazilians as *bichos do pé* (foot-beasts). Mr H. C. Dent had five of these unwelcome guests from January to June, and they took up their abode in the following localities: the first on the right big toe, second on the right heel, third on the left heel, and two under the sole of the left foot. He had to cut them out.

Still worse are the *verne*, which attack indifferently cattle and human beings. With animals, they appear to raise a large hard lump, so that they probably reside in the skin after the fashion of the ox-warble in this country. Sir Richard Burton says that stories are current of negroes losing their lives from the *berno*. The grub is deposited in the nose and other parts of the body, and if squeezed to death, instead of extracted, it festers, and produces serious consequences. Children of three months' old may suffer from a visitation of the *berno*. Some of the natives, in the case of adults, apply a burning stick to the wound, in order to destroy the worm. Mercurial ointment is also used. Mr Dent's dog was one mass of sores from the *bernos* and *bichos do pé*, and it was pitiable to see him, when running about, turn round almost every minute and, with a pitiful whine, bite his wounds until they were raw. Such are some of the pleasures of the insect world of Brazil.

UNSUNG HEROES.

So long as the world and the heart are young,
Shall deeds of daring and valour be sung;

And the hand of the poet shall throw the rhyme
At the feet of the hero of battle-time.

But nobler deeds are done every day
In the world close by, than in fight or fray.

There are heroes whose prowess never sees light,
Far greater than ever was ancient knight.

In many a heart lies a secret tale
That would make the Homeric legends pale;

And oft is a deed of valour untold
Which is meet to be written in letters of gold!

GREAT WRITERS AND THEIR ART.

DOGBERRY declared that 'to write and read comes by nature;' and if we but interpret him rightly, he was perfectly justified in his opinion. It will be remembered, however, that Pope thought somewhat differently. In one of his most celebrated couplets he has it that

True ease in writing comes from art, not chance,
As those move easiest who have learn'd to dance.

At first sight, it might seem that the two judgments can hardly consist with each other. But their self-contradiction is really only on the surface. Dogberry's remark very well expresses the fact that without an overpowering natural instinct to expression, no one can become a distinguished writer. On the other hand, the saying of Pope emphasises the truth, which all literary history bears out, that mastery of language comes only of the most strenuous endeavour. It has often been remarked that writers of the very highest order are far more rare than musicians or painters of the same high rank in their respective arts. During the last two thousand years the world has seen only some half-dozen poets of the first rank; whereas, even during the last two hundred, the number of first-rate musical composers is considerably larger than this. The usual explanation given of the fact seems entirely satisfactory. What forms the materials of the writer is clear and definite thought ranging over the whole field of human life, with language adequate to it; and a moment's consideration shows that to master such materials implies a vastly greater effort than is demanded of the painter or the musical composer.

It is interesting to consider the various methods by which great writers have trained themselves to perfection in their art. The other day a contemporary took the world into his confidence, and gave us a curious history of the apprenticeship he served as a man of letters. The account of Mr Louis Stevenson is doubly interesting, from the fact that it is specially in style, as distinct from matter, that he has won the praise of critics. The

wonderful range of his vocabulary and his singular felicity in the choice of words arrested attention at the very outset of his literary career. In his case, therefore, the method he followed in attaining this perfection has a special interest. From boyhood, he tells us, it was his habit to carry about with him a note-book and pencil, and on every possible occasion to set himself to write a description of the objects around him. Such exclusive attention to mere expression—for the subject, he tells us, was entirely indifferent to him—must, it is evident, bring with it its own drawbacks. The critics, as might have been expected, have not been slow to find in the work of Mr Stevenson distinct evidence of this peculiar self-discipline. They have all along seen, they assert, that his capital defect as a writer is that his expression much outruns his thinking; and they point to his early training as the evident cause of the disproportion.

It is curious, however, that a somewhat similar discipline was pursued by the most exquisite of American prose-writers, Nathaniel Hawthorne. Hawthorne, as is felt even by those who find little interest in his stories, is unapproachable in the art of saying the subtlest things in the simplest and most graceful way. His art in this respect is so consummate that it can be best described in Dogberry's words, as coming by nature. Yet so far is this from being the case, that all through life, Hawthorne had that habit which Mr Stevenson practised in his youth. Whenever circumstances would permit, he made a point of elaborately noting all the experiences of each day. At home, for example, he set himself to describe the minute changes of nature in his daily walks. His American note-books are filled with trivial details, which can have interested him only as affording scope for practice in writing.

The method of acquiring a good style practised last century—by Adam Smith, amongst others—was assiduous translation from great foreign writers. From this practice it was supposed that two good results must follow. In translating a sentence, we have a definite thought before us, for

which we must find an exact equivalent in our own speech. Hence, it was supposed that the assiduous practice of translation must necessarily teach that prime quality in all good writing—precision. Again, in translating a great writer, we are carried beyond our own range of thought and feeling, from which it should follow that the range of our vocabulary should necessarily be widened. This method has one advantage over the other—it is not so apt to lead to the use of words as mere counters, but keeps constantly before us the organic connection which should hold between thought and language. Yet few would nowadays recommend this practice to one really desirous of acquiring the habit of clear and simple expression. The translator in time inevitably acquires something of the tones and idioms of the language from which he translates. Gibbon is an example of a writer who lost something of the simplicity of his native idiom by his constant use of French. It would seem, indeed, that an equal acquaintance with any two languages precludes the perfectly idiomatic use of either.

Readers of Benjamin Franklin's autobiography will remember how diligently he strove to acquire a good English style. The method he chiefly practised was one which many great writers have followed. His practice was to read over a passage from some approved author, and then in his own words strive to give the same sense. By a comparison of his own composition with the original, he was taught by that most effective of all forms of instruction—the contrast between a good and a bad model. It cannot be said that Franklin with all his industry ever attained to what is called distinction of style; he writes plainly and simply and in entire keeping with his subject, but the dryness of his manner is perhaps in some measure due to the excessive practice of this mechanical method in his youth. It is easy to see, indeed, that all these methods carried to excess must result in the loss of that spontaneity and individuality which should mark every man's writing not less than his speech and demeanour. When thought and experience do not keep pace with power of expression, we may have brilliancy indeed, but never that highest grace or power which belongs only to language coming straight from the heart.

There is still another discipline, to the practice of which many distinguished prose-writers have attributed much of their skill in the use of language. This is the practice of verse-making in youth. Undoubtedly, of all modes of literary training this is the one most likely to lead to the best results. In the first place, these writers practised it not in the spirit of mere mechanical exercise, but in the inspiring delusion that poetry was their natural mode of expression. The exercise practised in this spirit can never become a mere forcing process. Thought, emotion, and language have in this case free, natural play; and the whole man grows as nature meant. The delusion soon passes; but in the meantime the mind has passed through a training which for the purposes of literature is invaluable. The most practised poets bear testimony to the intense mental concentration required to produce even fairly good verse. Byron, who had greater facility than most of his brethren, declared that it was necessary to write every day for years even to

rhyme well. Besides the exigences of rhyme and metre, which make their own difficulties, the tests in the choice and rejection of words are infinitely finer in verse than in prose. In the composition of a single couplet, the number of words called up and rejected is truly surprising, as any one who tries his hand will find. A curious notion once prevailed that it was impossible in the nature of things to be at once a great poet and a great prose-writer. In view of the history of literature, it is strange how this idea should have arisen. For magnificence of prose style no English writer has surpassed Milton. Edmund Burke took Dryden as his model in the qualities of strength and precision. For grace and simplicity, the poets Gray, Cowper, and Goldsmith hold the first place in our literature. Sainte-Beuve, the greatest of French critics, is a conspicuous example of the value of such a discipline. In his youth he mistook the true bent of his genius, and cultivated poetry. He afterwards discovered his mistake; but he was fully aware that he could not have chosen a better mode of preparing himself for the work he afterwards did.

The moral of all this is that Dogberry's remark, true enough so far as it goes, must undoubtedly be supplemented by the maxim of Pope. The stanza of the poet, the paragraph of the prose-writer, where every word seems to find its place as by some inevitable law of nature, is in reality the consummate result of an apprenticeship the most stringent and exacting in the world. 'At length,' exclaims Goethe—'at length, after forty years, I have learned to write German.' It surprises us to learn how hard even the most original and spontaneous of poets have toiled at their art. Burns is supposed to have owed less to premeditation than almost any other poet, yet we know that he was acquainted with all the great English poets, and that he read them in such a way that no academic training could have more successfully set all his faculties at work. Heine has the reputation of being the most spontaneous of lyrical poets; yet it was reported but the other day that one of his songs, which had struck every one as being as unforced as a bird's warble, was written and rewritten some half-dozen times, the poet's blurred manuscript revealing the mental struggle that had gone to its production. It may be an inadequate definition of genius to say that it is an 'infinite capacity of taking pains.' The words at all events express the inevitable conditions under which it can alone manifest itself.

THIS MORTAL COIL.

CHAPTER XXXV.—RETRIBUTION.

OH the horror and drudgery of those next few weeks, while Hugh, in a fever of shame and disgust, was anxiously and wearily making difficult arrangements, financial or otherwise, for that hopeless flitting to the sunny South, that loomed ahead so full of gloom and wretchedness for himself and Winifred! There was nothing for it left now but to face the unspeakable, to endure the unendurable. He must go through with it all, let it cost what it might. For at least in the end he had one comfort. At San Remo, Winifred would find out she was mistaken; there was no Elsie at all, there or elsewhere.

Meanwhile, Winifred grew rapidly worse, so ill, that even Hugh began to perceive it, and despaired of being able to carry her in safety to San Remo. The shock at the Relfs' had told seriously upon her weak and shattered constitution; the constant friction of her relations with Hugh continued to tell upon it every day that passed over her. The motherless girl and childless mother brooded in secret over her great grief; she had no one, absolutely no one on earth who could sympathise with her in her terrible trouble. She longed to fling herself upon Elsie's bosom—the dear old Elsie that had once been, the Elsie that perhaps could still understand her—and to cry aloud to her for pity, for sympathy. When she got to San Remo, she sometimes thought, she would tell all—every word—to Elsie; and Elsie at least must be very much changed if in spite of all she could not feel for her.

Proud as she was, she would throw herself on Elsie's mercy. Elsie had wronged her, and she would tell all to Elsie. But not to Hugh. Hugh was hard and cold and unyielding as steel. It would not be for long. She would soon be released. And then Hugh— She shrank from thinking it.

At last the day came for their journey South. They were going alone, without even a maid; glad to have paid the servants their arrears and escape alive from the clutches of the butchers and bakers. November fogs shrouded the world. Hugh had completed those vile transactions of his with the attorneys and the money-lenders, and felt faintly cheered by the actual metallic chink of gold for the journey rattling and jingling in his trousers' pocket. But Winifred sat very weak and ill in the far corner of the first-class carriage that bore them away from Charing Cross Station. They had come up the day before from Almundham to town, and spent the night luxuriously in the rooms of the *Métropole*. You must make a dying woman comfortable. And Hugh had dropped round with defiant pride into the Cheyne Row Club, assuming in vain the old jaunty languid poetical air—'of the days before he had degenerated into land-owning,' Hatherley said afterwards—just to let recalcitrant Bohemia see for itself it hadn't entirely crushed him by its jingling jibes and its scathing critiques of *A Life's Philosophy*. But the protest fell flat; it was indeed a feeble one: heedless Bohemia, engrossed after its wont with its last new favourite, the rising author of *Lays of the African Lakeland*, held out to Hugh Massinger of White-strand Hall its flabbiest right hand of lukewarm welcome. And this was the Bohemia that once had grasped his landless fingers with fraternal fervour of sympathetic devotion! The chilliness of his reception in the scene of his ancient popularity stung the Bard to the quick. No more for him the tabour, the cymbals, and the oaten pipe; no more the blushful Cheyne Row Hippocrene. He felt himself *démodé*. The rapid stream of London society and London thought had swept eddying past and left him stranded. Oh for some enchanted carpet of the Arabian Nights, to transport him back with a bound from his present self to those good old days of Thirds and Elsie!

But enchanted carpets are now unhappily out of date, and Channel steamers have quite superseded the magical shallops of good Haroun-al-

Raschid. In plain prose, the Straits were rough, and Winifred suffered severely from the tossing. At Calais, they took the through train for Marseilles, having secured a *coupé-lit* at Charing Cross beforehand.

That was a terrible night, that night spent in the *coupé-lit* with Winifred: the most terrible Hugh had ever endured since the memorable evening when Elsie drowned herself.

They had passed round Paris at gray dusk, in their comfortable through-carriage, by the *Chemin de Fer de Ceinture* to the Gare de Lyon, and were whirling along on their way to Fontainebleau through the shades of evening, when Winifred first broke the ominous silence she had preserved ever since they stopped at St-Denis. 'It won't be for long now,' she said dryly, 'and it will be so convenient for you to be at San Remo.'

Hugh's heart sank once more within him. It was quite clear that Winifred thought Elsie was there. He wished to heaven she was, and that he was no murderer. Oh the weight that would have been lifted off his weary soul if only he could think it so! The three years' misery that would rise like a mist from his uncertain path, if only he did not know to a certainty that Elsie lay buried at Orfordness in the shipwrecked sailors' graveyard by the Low Lighthouse. He looked across at Winifred as she sat in her place. She was pale and frail; her wasted cheeks showed white and hollow. As she leaned back there, with a cold light gleaming hard and chilly from her sunken blue eyes—those light blue eyes that he had never loved—those cruel blue eyes that he had learned at last to avoid with an instinctive shrinking, as they gazed through and through him with their flabby persistence—he said to himself with a sigh of relief: 'She can't last long. Better tell her all, and let her know the truth. It could do no harm. She might die the happier. Dare I risk it, I wonder? Or is it too dangerous?'

'Well?' Winifred asked in an icy tone, interpreting aright the little click in his throat and the doubtful gleam in his shifty eyes as implying some hesitating desire to speak to her. 'What lie are you going to tell me next? Speak it out boldly; don't be afraid. It's no novelty. You know I'm not easily disconcerted.'

He looked back at her nervously with bent brows. That fragile small creature! He positively feared her. Dare he tell her the truth? And would she believe it? Those blue eyes were so coldly glassy. Yet, with a sudden impulse, he resolved to be frank; he resolved to unburden his guilty soul of all its weight of care to Winifred.

'No lie, Winifred, but the solemn truth,' he blurted out slowly, in a voice that of itself might have well produced complete conviction—on any one less incredulous than the wife he had cajoled and deceived so often. 'You think Elsie's at San Remo, I know.—You're wrong there; you're quite mistaken.—She's not in San Remo, nor in Australia either. That was a lie.—Elsie's dead—dead three years ago—before we were married.—Dead and buried at Orfordness. And I've seen her grave, and cried over it like a child, too.'

He spoke with solemn intensity of earnestness; but he spoke in vain. Winifred thought, herself, till that very moment, she had long since reached

the lowest possible depth of contempt and scorn for the husband on whom she had thrown herself away; but as he met her then with that incredible falsehood—as she must needs think it—on his lying lips, with so grave a face and so profound an air of frank confession, her lofty disdain rose at once to a yet sublimer height of disgust and loathing of which till that night she could never even have conceived herself capable. ‘You hateful Thing!’ she cried, rising from her seat to the centre of the carriage, and looking down upon him physically from her point of vantage as he cowered and slunk like a cur in his corner. ‘Don’t dare to address me again, I say, with lies like that. If you can’t find one word of truth to tell me, have the goodness at least, since I don’t desire your further conversation, to leave me the repose of your polite silence.’

‘But, Winifred,’ Hugh cried, clasping his hands together in impotent despair, ‘this is the truth, the very, very truth, the whole truth, that I’m now telling you. I’ve hidden it from you so long by deceit and treachery. I acknowledge all that: I admit I deceived you. But I want to tell you the whole truth now; and you won’t listen to me! O heaven, Winifred, you won’t listen to me!’

On any one else, his agonised voice and pleading face would have produced their just and due effect; but on Winifred—impossible.

‘Go on,’ she murmured, relapsing into her corner. ‘Continue your monologue. It’s supreme in its way—no actor could beat it. But be so good as to consider my part in the piece left out altogether. I shall answer you no more. I should be sorry to interrupt so finished an artist!’

Her scathing contempt wrought up in Hugh a perfect fury of helpless indignation. That he should wish to confess, to humble himself before her, to make reparation! and that Winifred should spurn his best attempt, should refuse so much as to listen to his avowal! It was too ignominious. ‘For heaven’s sake,’ he cried, with his hands clasped hard, ‘at least let me speak. Let me have my say out. You’re all wrong. You’re wronging me utterly. I’ve behaved most wickedly, most cruelly, I know: I confess it all. I abase myself at your feet. If you want me to be abject, I’ll grovel before you! I admit my crime, my sin, my transgression.—I won’t pretend to justify myself at all.—I’ve lied to you, forged to you, deceived you, misled you!’ (At each clause and phrase of passionate self-condemnation, Winifred nodded a separate sardonic acquiescence.) ‘But you’re wrong about this. You mistake me wholly.—I swear to you, my child, Elsie’s not alive. You’re jealous of a woman who’s been dead for years. For my sin and shame I say it, she’s dead long ago!’

He might as well have tried to convince the door-handle. Winifred’s loathing found no overt vent in angry words; she repressed her speech, her very breath almost, with a spasmodic effort. But she stretched out both her hands, the palms turned outward, with a gesture of horror, contempt, and repulsion; and she averted her face with a little cry of supreme disgust, checked deep down in her rising throat, as one averts one’s face instinctively from a loathsome sore or a venomous reptile. Such hideous duplicity to

a dying woman was more than she could brook without some outer expression of her outraged sense of social decency.

But Hugh could no longer restrain himself now; he had begun his tale, and he must run right through with it. The fever of the confessional had seized upon his soul; remorse and despair were goading him on. He must have relief for his pent-up feelings. Three years of silence were more than enough. Winifred’s very incredulity compelled him to continue. He must tell her all—all, utterly. He must make her understand to the uttermost jot, willy, nilly, that he was not deceiving her!

With eager lips, he began his story from the very beginning, recapitulating point by point his interview with Elsie in the Hall grounds, her rushing away from him to the roots of the poplar, her mad leap into the swirling black water, his attempt to rescue her, his unconsciousness, and his failure. He told it all with dramatic completeness. Winifred saw and heard every scene and tone and emotion as he reproduced it. Then he went on to tell her how he came to himself again on the bank of the dike, and how in cold and darkness he formed his Plan, that fatal, horrible, successful Plan, which he had ever since been engaged in carrying out and in detesting. He described how he returned to the inn, unobserved and untracked; how he forged the first compromising letter from Elsie; and how, once embarked upon that career of deceit, there was no drawing back for him in crime after crime till the present moment. He despised himself for it; but still he told it. Next came the episode of Elsie’s bedroom: the theft of the ring and the other belongings; the hasty flight, the fall from the creeper; and his subsequent horror of the physical surroundings connected with that hateful night adventure. In his agony of self-accusation he spared her no circumstance, no petty detail: bit by bit he retold the whole story in all its hideous inhuman ghastliness—the walk to Orfordness, the finding of the watch, the furtive visit to Elsie’s grave, his horror of Winifred’s proposed picnic to that very spot a year later. He ran, unabashed, in an ecstasy of humiliation, through the entire tale of his forgeries and his deceptions: the sending of the ring; the audacious fiction of Elsie’s departure to a new home in Australia; the long sequence of occasional letters; the living lie he had daily and hourly acted before her. And all the while, as he truly said, with slow tears rolling one by one down his dark cheeks, he knew himself a murderer: he felt himself a murderer; and all the while, poor Elsie was lying, dishonoured and unknown, a nameless corpse, in her pauper grave upon that stormy sand-spit.

Oh the joy and relief of that tardy confession! the gush and flow of those pent-up feelings! For three long years and more, he had locked it all up in his inmost soul, chafing and seething with the awful secret; and now at last he had let it all out, in one burst of confidence, to the uttermost item.

As for Winifred, she heard him out in solemn silence to the bitter end, with ever-growing contempt and shame and hatred. She could not lift her eyes to his face, so much his very

earnestness horrified and appalled her. The man's aptitude for lying struck her positively dumb. The hideous ingenuity with which he accounted for everything—the diabolically clever way in which he had woven in, one after the other, the ring, the watch, the letters, the picnic, the lonely tramp to Orfordness—smote her to the heart with a horrible loathing for the vile wretch she had consented to marry. That she had endured so long such a miserable creature's bought caresses filled her inmost soul with a sickening sense of disgust and horror. She cowered and crouched closer and closer in her remote corner: she felt that his presence there actually polluted the carriage she occupied; she longed for Marseilles, for San Remo, for release, that she might get at least farther and farther away from him. She could almost have opened the door in her access of horror and jumped from the train while still in motion, so intense was her burning and goading desire to escape for ever from his poisonous neighbourhood.

At last, as Hugh with flushed face and eager eyes calmed down a little from his paroxysm of self-abasement and self-revelation, Winifred raised her eyes once more from the ground and met her husband's—ah, heaven!—that she should have to call that thing her husband! His acting chilled her; his pretended tears turned her cold with scorn. 'Is that all?' she asked in an icy voice. 'Is your romance finished?'

'That's all!' Hugh cried, burying his face in his hands and bending down his body to the level of his knees in utter and abject self-humiliation. 'Winifred! Winifred! it's no romance. Won't you, even now, even now believe me?'

'It's clever—clever—extremely clever!' Winifred answered in a tone of unnatural calmness. 'I don't deny it shows great talent. If you'd turned your attention seriously to novel-writing, which is your proper *métier*, instead of to the law, for which you've too exuberant an imagination, you'd have succeeded ten thousand times better there than you could ever do at what you're pleased to consider your divine poetry. Your story, I allow, hangs together in every part with remarkable skill. It's a pity I should happen to know it all from beginning to end for a tissue of falsehoods.—For all your acting, you know you're lying to me even now, this minute. You know that Elsie Challoner, whom you pretend to be dead, is awaiting your own arrival to-night by arrangement at San Remo.'

Hugh flung himself back in the final extremity of utter despair on the padded cushions. He had played his last card with Winifred, and lost. His very remorse availed him nothing. His very confession was held to increase his sin. What could he do? Whither turn? He knew no answer. He rocked himself up and down on his seat in hopeless misery. The worst had come. He had blurted out all. And Winifred, Winifred would not believe him.

'I wish it was true!' he cried; 'I wish it was true, Winnie! I wish she was there. But it isn't; it isn't! She's dead! I killed her! and her blood has weighed upon my head ever since! I pay for it now! I killed her! I killed her!'

'Listen!'

Winifred had risen to her full height in the coupé once more, and was standing, gaunt and haggard and deadly wan like a shrunken little tragedy queen above him. Her pale white face showed paler and whiter and more death-like still by the feeble light of the struggling oil-lamp; and her bloodless lips trembled and quivered visibly with inner passion as she tried to repress her overpowering indignation with one masterful effort. 'Listen!' she said, with fierce intensity. 'What you say is false. I know you're lying to me. Warren Relf told me himself the other day in London that Elsie Challoner was still alive, and living, where you know she lives, over there at San Remo.'

Warren Relf! That serpent! That reptile! That eavesdropper! Then *this* was the creature's mean revenge! He had lied that despicable lie to Winifred! Hugh hated him in his soul more fiercely than ever. He was baffled once more; and always by that same malignant intriguer!

'Where did you see Relf?' he burst out angrily. His indignation, flaring up to white-heat afresh at this latest machination of his ancient enemy, gave new strength to his words and new point to his hatred. 'I thought I told you long since at Whitestrand to hold no further communication with that wretched being!'

But Winifred by this time, worn out with excitement, had fallen back speechless and helpless on the cushions. Her feeble strength was fairly exhausted. The fatigue of the preparations, the stormy passage, the long spell of travelling, the night journey, and added to it all, this terrible interview with the man she had once loved, but now despised and hated, had proved too much in the end for her weakened constitution. A fit of wild incoherence had overtaken her; she babbled idly on her seat in broken sentences. Her muttered words were full of 'mother' and 'home' and 'Elsie.' Hugh felt her pulse. He knew it was delirium. His one thought now was to reach San Remo as quickly as possible. If only she could live to know Warren Relf had told her a lie, and that Elsie was dead—dead—dead and buried!

Perhaps even this story about Warren Relf and what he had told her was itself but a product of the fever and delirium! But more probably not. The man who could open other people's letters, the man who could plot and plan and intrigue in secret to set another man's wife against her own husband, was capable of telling any lie that came uppermost to hurt his enemy and to serve his purpose. He knew that lie would distress and torture Winifred, and he had struck at Hugh, like a coward that he was, through a weak, hysterical, dying woman! He had played on the mean chord of feminine jealousy. Hugh hated him as he had never hated him before. He should pay for this soundly—the cur, the scoundrel!

CHAPTER XXXVI.—THE OTHER SIDE OF THE SHIELD.

That self-same night, another English passenger of our acquaintance was speeding in hot haste due southward to San Remo, not indeed by the Calais and Marseilles express, but by the rival route via Boulogne, the Mont Cenis, Turin, and Savona. Warren Relf had chosen the alternative road by

deliberate design, lest Hugh Massinger and he should happen to clash by the way, and a needless and unseemly scene should perhaps take place before Winifred's very eyes at some intermediate station.

It was by the merest accident in the world, indeed, that Warren had heard, in the nick of opportunity, of the Massingers' projected visit to San Remo.

In the cosy smoking-room at the Cheyne Row Club, he had found Hatherley already installed in a big armchair, discussing coffee and the last new number of the *Nineteenth Century*.

'Hullo, Relf! The remains of the Bard were in here just now,' Hatherley exclaimed as he entered. 'You've barely missed him. If you'd dropped in only ten minutes earlier, you might have inspected the interesting relics. But he's gone back to his hotel by this time, I fancy. The atmosphere of Cheyne Row seems somewhat too redolent of vulgar Cavendish for his refined taste. He smokes nothing nowadays himself but the best regalias!'

'What, Massinger?' Relf cried in some slight surprise. 'How was he, Hatherley, and what was he doing in town at this time of year? All good Squires ought surely to be down in the country now at their hereditary work of supplying the market with a due proportion of hares and partridges.'

'Oh, he's a poor wreck,' Hatherley answered lightly. 'You've hit it off exactly—sunk to the level of the landed aristocracy. He exhales an aroma of vested interests. Real estate's his Moloch at present, and he bows the knee to solidified sea-mud in the temple of Rimmion. He has no views on anything in particular, I believe, but riparian proprietorship: complains still of the German Ocean for disregarding the sacred rights of property; and holds that the sole business of an enlightened British legislature is to keep the sand from blowing in at his own inviolable dining-room windows. Poor company, in fact, since he descended to the Squirearchy.'

'How long's he going to stop in town—do you know?' Relf asked curiously.

'Thank goodness, he's not going to stop at all, my dear fellow. If he were, I'd run down to Brighton for the interval. A month of Massinger at the Cheyne Row would be a perfect harvest for the seaside lodgings. But I'm happy to tell you he's going to remove his mortal remains—for the soul of him's dead—dead and buried, long ago, in the Whitestrand sandhills—to San Remo to-morrow. Poor little Mrs Massinger's seriously ill, I'm sorry to say. Too much Bard has told at last upon her. Bard for breakfast, Bard for lunch, and Bard for dinner would undermine in time the soundest constitution. Sir Anthony finds it's produced in her case Suppressed Gout, or Tubercular Diathesis, or Softening of the Brain, or something lingering and humorous of that sort; and he's ordered her off, post haste, by the first express, to the Mediterranean. Massinger objected at first to San Remo, he tells me, probably because, with his usual bad taste, he didn't desire to enjoy your agreeable society; but that skimpy little woman, gout or no gout, has a will of her own, I can tell you; San Remo she insists upon, and to San Remo the Bard must go accordingly. You should

have seen him chafing with an internal fire as he let it all out to us, hint by hint, in the billiard-room this evening. Poor skimpy little woman, though, I'm awfully sorry for her. It's hard lines on her. She had the makings of a nice small hostess in her once; but the Bard's ruined her—sucked her dry and chucked her away—and she's dying of him now, from what he tells me.'

Warren Relf looked back with a start of astonishment. 'To San Remo?' he cried. 'You're sure, Hatherley, he said San Remo?'

'Perfectly certain. San Remo it is. Observe, hi presto, there's no deception. He gave me this card in case of error: "Hugh Massinger, for the present, Poste Restante, San Remo." No other address forthcoming as yet. He expects to settle down at a villa when he gets there.'

Relf made up his mind with a single plunge as he knocked his ash off. 'I shall go by to-morrow's express to the Riviera,' he said shortly.

'To pursue the Bard? I wouldn't, if I were you. To tell you the truth, I know he doesn't love you.'

'He has reason, I believe. The feeling is perhaps to some extent mutual. No, not to pursue him—to prevent mischief.—Hand me over the Continental Bradshaw, will you?—Thanks. That'll do. Do you know which line? Marseilles, I suppose? Did he happen to mention it?'

'He told me he was going by Dijon and Lyons.'

'All right. That's it. The Marseilles route. Arrive at San Remo at 4.30. I'll go round the other way by Turin and intercept him. Trains arrive within five minutes of one another, I see. That'll be just in time to prevent any *contre-temps*.'

'Your people are at San Remo already, I believe?'

'My people—yes. But how did you know? They were at Mentone for a while, and they only went on home to the Villa Rossa the day before yesterday.'

'So I heard from Miss Relf,' Hatherley answered with a slight cough. 'She happened to be writing to me—about a literary matter—a mere question of current art-criticism—on Wednesday morning.'

Warren hardly noticed the slight hesitation: and there was nothing odd in Edie's writing to Hatherley: that best of sisters was always jogging the memory of inattentive critics. While Edie lived, indeed, her brother's name was never likely to be forgotten in the weekly organs of artistic opinion. She insured it, if anything, an undue prominence. For her much importunity, the sternest of them all, like the unjust judge, was compelled in time to notice every one of her brother's performances.

So Warren hurried off by himself at all speed to San Remo, and reached it at almost the same moment as Massinger. If Hugh and Elsie were to meet unexpectedly, Warren felt the shock might be positively dangerous.

As he emerged from the station, he hired a close carriage, and ordered the *vetturino* to draw up on the far side of the road and wait a few minutes till he was prepared for starting. Then he leaned back in his seat in the shade of the hood, and held himself in readiness for the arrival of the Paris train from Ventimiglia.

He had waited only a quarter of an hour when Hugh Massinger came out hastily and called a cab. Two porters helped him to carry out Winifred, now seriously ill, and muttering inarticulately as they placed her in the carriage. Hugh gave an inaudible order to the driver, who drove off at once with a nod and a smile and a cheery 'Si, signor.'

'Follow that carriage!' Warren said in Italian to his own cabman. The driver nodded and followed closely. They drove up through the narrow crowded little streets of the old quarter, and stopped at last opposite a large and dingy yellow-washed *pension*, in the modern part of the town, about the middle of the Avenue Vittorio-Emmanuele. The house was new, but congenitally shabby. Hugh's carriage blocked the way already. Warren waited outside for some ten minutes without showing his face till he thought the Massingers would have engaged rooms: then he entered the hall boldly and inquired if he could have lodgings.

'On what floor has the gentleman who just arrived placed himself?' he asked of the landlord, a portly Piedmontese, of august dimensions.

'On the second story, signor.'

'Then I will go on the third,' Warren Relf answered with short decision. And they found him a room forthwith without further parley.

The *pension* was one of those large and massive solid buildings, so common on the Riviera, let out in flats or in single apartments, and with a deep well of a square staircase occupying the entire centre of the block like a covered courtyard. As Warren Relf mounted to his room on the third floor, with the chatty Swiss waiter from the canton Ticino, who carried his bag, he asked quietly if the lady on the *segondo* who seemed so ill was in any immediate or pressing danger.

'Danger, signor? She is ill, certainly; they carried her up-stairs: she couldn't have walked it. Ill—but ill.' He expanded his hands and pursed his lips up.—'But what of that? The house expects it. They come here to die, many of these English. The signora no doubt will die soon. She's a very bad case. She has hardly any life in her.'

Little reassured by this cold comfort, Warren sat down at the table at once, as soon as he had washed away the dust of travel, and scribbled off a hasty note to Edie:

DEAREST E.—Just arrived. Hope you received my telegram from Paris. For heaven's sake, don't let Elsie stir out of the house till I have seen you. This is most imperative. Massinger and Mrs Massinger are here at this *pension*. He has brought her South for her health's sake. She's dying rapidly. I wouldn't for worlds let Elsie see either of them in their present condition: above all, she mustn't run up against them unexpectedly. I may not be able to sneak round to-night, but at all hazards keep Elsie in till I can get to the Villa Rossa to consult with you. Elsie must of course return to England at once, now Massinger's come here. We have to face a very serious crisis. I won't write further, preferring to come and arrange in person. Meanwhile, say nothing to Elsie just yet; I'll break it to her myself.—In breathless haste, Yours ever, very affectionately,

WARREN.

He sent the note round with many warnings by the Swiss waiter to his mother's house. When Edie got it, she could have cried with chagrin. Could anything on earth have been more unfortunate? To think that Elsie should just have gone out shopping before the note arrived—and should be going to call at the Grand Hotel Royal in that very Avenue Vittorio-Emmanuele!

(To be continued.)

PALLAS'S SAND-GROUSE.

CHIEF among the ornithological events chronicled during the year will be the visit to the British Isles of Pallas's sand-grouse, a bird whose habitat is the extensive sandy plains of Central Asia. On previous occasions, our shores have been visited by this migrant, but only once (1863) in such numbers as at present.

The first authentically recorded instance of its coming here was in 1859; but its stay was short. Four years later, it was again found in this country, the invasion, which far exceeded that of 1859, numbering many hundreds of birds. But, as was the case during the preceding visit, the gun was soon at work, and the sand-grouse, finding itself in a land of enemies, speedily quitted its newly found home. The bulk of the specimens secured on that occasion were shot on the east coast of England. In 1872 and 1876, a few stray birds found their way here; but the visits were unimportant. Now, however, the sand-grouse has once more made its appearance in this country in numbers which in all probability exceed the remarkable irruption of a quarter of a century ago. In 1863 the migrants were first observed in May; and in the present instance it was about the middle of the same month that they were first recorded as being again with us. Following the advance birds, coveys arrived daily, until now the species is scattered over a wide area, ranging from northerly Shetland and Orkney to the east coast of Ireland, Scotland, and the warmer latitude of the southern counties of England. What may be the cause of the present irruption can only be guessed at. Some incline to the supposition that it is due to a local influence, such as a late season, extreme increase in numbers, or that peculiar disposition to roam which is met with in so many animals in different countries. It is also thought that the invasion may have been brought about by the land becoming what is known as 'sour,' a circumstance which causes animals that have lived upon its herbage to wither and die if they exist upon it beyond a certain period. Others oppose this latter view, and argue that, since the birds which have been shot in this country soon after their arrival have been plump, it cannot be want of proper food that has induced them to quit their native plains. What the real reason for their migration is must be left for the future to determine, though the majority of those able to judge incline to the view that it is extreme increase in numbers.

Scientifically considered, the sand-grouse is somewhat of a remarkable bird, inasmuch as it bears a resemblance to the pigeon, plover, and common grouse; but it is more nearly allied to the latter than to the two former. It is not,

however, a true grouse, and the bird which forms the subject of this article is one of two that constitute the genus *Syrhaptes*, a sub-family which have their toes so closely united as to almost present the appearance of a pad, the hind-toe being wanting. Pallas's sand-grouse, the only representative of the species which ever visits this country, is about the size of a pigeon; and in the male, the tail and wings are prolonged to a point, which gives the bird the appearance, when standing at a little distance, of having two long forked tails. In the female, these elongations are absent. The colouring of the bird is very pretty, being on the upper parts of a bright yellowish buff, spotted and pencilled with dark brown and black. The head and throat are of an orange hue, and the under parts gray and black. In the female, which is the larger bird, the colours are somewhat subdued. The nesting season is the end of May or beginning of June; and the place selected for the nest is usually a sandy spot on the plain, a tuft of heather or coarse grass, or under the shelter of a stunted shrub. The nest, if such it can be called, is composed of a few stalks of grass; or it may be simply a shallow hole scratched in the sand, or the middle of a tuft of the herbage flattened down. In this receptacle three eggs, as a rule, are deposited—rarely is the number more or fewer. In shape they resemble those of a pigeon; but in colour they are not unlike those of a plover, being of a pale olive brown, marked with a darker hue. The birds are monogamous. Each parent sits alternately upon the eggs, and the young very quickly reach maturity. In common with others of its kind, the sand-grouse is fond of basking in the sun, and in the desert plains from which it hails it is enabled to indulge this liking to the full. It assimilates so very closely with its sandy surroundings that, upon one bird uttering a warning cry, a whole flock may sometimes be seen to rise from where but a moment previously no signs of life were visible. The sand-grouse visits fresh water in the morning, and each pair uttering a peculiar cry as they fly, others join them on the route, so that a covey is soon formed. Their food consists principally of the seeds of grasses and small cruciferous plants, especially those of an oleaginous nature. When about to migrate—for they are possessed of a great migratory instinct, passing from one vast uncultivated plain to another—they collect in countless flocks, and, commencing their journey in the night, spread themselves over very large tracts of country.

When the sand-grouse visited us in 1863, the opinion was expressed that if let alone it would establish itself here, and for this supposition there seemed to be good ground, inasmuch as some of the migrants that year nested in Sweden, Denmark, and Holland; but, as before stated, it was accorded such an inhospitable reception that it soon quitted the country. Now, after the lapse of a quarter of a century, we again have the opportunity of endeavouring to retain it amongst us. That the bird would breed here there is not the slightest doubt, for in the ovaries of some of the females that have been shot this year eggs have been found in various stages of development, and in one instance it is recorded that a nest has been discovered containing eggs; but with the usual result—it was taken. Why

every farmer upon whose land the bird has come should seek to destroy it with powder and shot, and why every so-called naturalist should desire to secure specimens, is utterly incomprehensible. As an addition to our feathered game, it would be a good acquisition, being said to be of a flavour only slightly inferior to that of the red-legged partridge. The bird is a non-percher; and when on the wing, it flies fast and straight, the flight resembling that of the golden plover, only it is swifter. In every respect it is an excellent bird for the sportsman. Let us, therefore, give up the wanton destruction we are now pursuing with regard to it, and allow it to nest within our shores, and, if it will, remain here and become naturalised. But for the murderous treatment to which it has been subjected by those who should protect it, there seems no reason why this should not be the case.

THE SILVER STREAM.

AN IDYL OF THE WYE.

IN FOUR CHAPTERS.—CONCLUSION.

THE picnic party returned in time for dinner, much to Mr Frederick Denton's outward and visible joy. Trevor, being younger, and as yet no admirer of the *nil admirari* school, expressed the opinion that they had had a particularly jolly day—a view fully endorsed by the sisters Moffat. There was sufficient time to change flannels and boating jackets for gray tweed and demi-toilet before the first warning of that 'tocsin of the soul, the dinner-bell,' though Horace Du Maurier made a point of appearing in all the glory of evening dress, with tiny diamond studs in his ample bosom, and moustache waxed to a pitch of perfection only acquired by long and constant practice.

During the progress of the meal, that prepossessing gentleman was unusually brilliant and vivacious. 'It is a fortunate thing that we do not dwell in the palace of truth,' Decie murmured under his breath, as he noted the many-sided facets of the Frenchman's nature. It would have considerably astonished the unsuspecting guests, had they known that under this dazzling display, this outward appearance of gaiety, Du Maurier was racking his versatile brain to discover some means of escape from the dilemma in which he was placed. Even the most wily adventurer cannot hope to keep up the necessary show without a certain amount of ready-money.

'What have you been doing all day?' asked the Colonel, addressing Decie during a pause in the conversation.—'Ah! you missed a treat, my boy. I never saw Symonds Yat looking more beautiful.'

Phil explained. He detailed the account of the accident, Rashleigh listening intently the while, wondering, with the tormenting conscience of a coward, if the speaker could possibly have overheard part of his conversation with Du Maurier. As he looked up, his glance encountered Decie's. There was something in the look that caused him to grow cold, and his glass to clink against his teeth with a sudden spasm of fear.

'Beautiful old church,' Denton struck in opportunely, 'especially interesting, as we are all such

critical judges of architecture.—I assure you, Miss Rashleigh, I never saw anything more curious than that tree—an elm in full leaf, actually growing inside the church. A most peculiar sight.'

Any further discussion upon this uncommon but nevertheless visible phenomenon was cut short by the exit of the ladies. Colonel Scobell pushed a silver cigarette box round the table and rang the bell for more claret. In two of the Oxford men, both fishing enthusiasts, he had discovered a pair of ready listeners, to whom he was detailing the account of a wonderful fish, caught by foul hooking a cast left in the salmon's gills by an angler, who had been broken by the same funny monster on the previous day.

'These fishermen beat any other sportsmen out of sight,' Trevor murmured.—'Did you hear that Phil? Come into the drawing-room.'

'Presently. Not that there is any particular reason why you should wait for me. I want to speak to Rashleigh a moment.'

Horace Du Maurier had disappeared. Rashleigh remained smoking feverishly, and paying more attention to the claret jug than was good for him or his nerves, as weak-minded men in the hour of trouble or anxiety will do. As Phil touched him suddenly on the shoulder, he started with something in his heart akin to terror.

'What do you want?' he asked a little defiantly, and instinctively upon his guard against some invisible though not unexpected danger.

'Come and play a game of billiards,' Decie replied. These signs of Rashleigh's perturbation were not lost upon him. 'We shall be sure to have the room to ourselves.'

Rashleigh obeyed reluctantly, and together they crossed the hall. Once in the room, Decie closed the door; and turning up the lamps, chose himself a cue, and without further preamble, commenced the play. Rashleigh, though by no means an inferior player, was no match for Decie, though usually he was far the more scientific exponent of that fascinating game.

'You have something on your mind,' Decie observed, executing a brilliant cannon.—'Not a bad shot that. I'll tell you what I will do. Two to one in half-crowns I pot the red and tell you what you are thinking about.'

'You would lose,' Rashleigh laughed recklessly.—'Ah! missed the red.—The other shot of yours would be about as successful.'

'By no means. Let me finish. You are at your wits' end to know where to find that money you owe Du Maurier. And further, you would like to tell me something, if you only dared.'

'How on earth did you know I owed Du Maurier anything?' Rashleigh exclaimed, off his guard. 'He told me no one knew but ourselves.'

'I do know, and you can't deny it. I would rather be under an obligation to my bitterest enemy than to that man. What do you owe him? I am not asking out of idle curiosity.'

'What do I owe him? Well, really I cannot quite say, there are so many transactions. Perhaps eighty or ninety pounds altogether.'

Decie spotted the red which his antagonist had potted. He seemed to have forgotten his previous curiosity in his new and revived interest in the game. Still, there was a grim dryness in his voice and manner that puzzled Rashleigh, and for which he was utterly at a loss to account.

'I do not wish to pry into your affairs,' Decie remarked at length. 'But you might just as well own the truth. You owe Du Maurier four hundred—money he has swindled you out of at cards, I presume. What possessed you to take up with a common blackleg like that?'

'I don't know,' Rashleigh replied, his face aflame.—'I've been an awful fool, Decie.'

'If I don't make a mistake, you've been something worse,' Decie put in *sotto voce*.

'Well, I have. And now the murder is out. I daresay you know we are both members of *The Lotos*—the gambling club in H—Street. I am quite in Du Maurier's power. He has only got to carry out his threat and post me as a defaulter. I couldn't face Cambridge after that.—Decie, I am the most miserable wretch under the sun!'

The unhappy boy threw his cue aside, and falling across the table with his face buried in his hands, sobbed aloud. He was not naturally bad, only weak and easily led into temptation, like many another lad wandering amongst the traps and pitfalls of university life.

Phil laid a hand upon the other's shoulder, speaking not unkindly. 'I think I can help you,' he said. 'I don't want to force your confidence; only, at the same time I have not the smallest intention of paying Du Maurier any sum he chooses to demand. And I don't want him to know I have a hand in this. I haven't much money with me—not quite a hundred pounds—but I can make up that sum. Offer him that, and he will jump at it.'

'Not he,' Rashleigh returned mournfully. 'He holds my paper to the amount of four hundred. You don't know him as I do.'

'Fortunately, I don't. I know him a great deal better—or worse,' said Phil dryly. 'I have an idea he will take it. Make the offer as if you meant it, and be a man for once. You shall have the money now, if you like. By good luck, I happen to have so much with me. And one word in conclusion. If he turns restive, just remark that Selby is of opinion that he is uncommonly lucky to get that.'

Hope springing eternal in the human breast, gave Rashleigh a momentary feeling of elation. But he was too much under the Frenchman's sinister influence to shake off the bondage as a bolder spirit would have done. He stood, inspired alternately by joy and fear, till Decie returned. He had in his hand a crisp roll of bank-notes, which he placed in Rashleigh's hand.

'There!' he exclaimed hurriedly. 'I have just seen Du Maurier, who is inquiring for you.—Now is your time. If you have any lingering traces of manliness, show a bold front, and the victory is yours.'

Decie had barely time to leave the room before Du Maurier entered. He seemed a trifle pale and agitated, now that he was alone with his fellow-conspirator and the mask had fallen from his face. 'I am fortunate in finding you here,' he said. 'We must forget our little difference this afternoon in face of the common danger.—See, my dear Gerard; the situation grows critical. I, even I, am puzzled. I must get away from here to-morrow; and how to raise the wind, as you call it, I do not know. I am reluctantly compelled to look to you, *mon cher*.'

'Supposing, by a lucky accident I am able to

accommodate you. If I was to say to you: "Du Maurier, here is a hundred pounds in hard cash," what advantage am I to have in return?"

'Advantage! The boy is mad. It is not for you to make terms with me. I shall teach you to kick over the traces! Bah! why these theatricals?'

Rashleigh braced himself for the coming trial. The possession of money to silence his tormentor's tongue gave him a new and sweet sense of power. 'I will be perfectly candid with you,' he said. 'Give me my paper, and in return I will hand you a hundred pounds. It is a fair bargain. You are driven into a corner, and I can help you out. You know how those *IOU's* were obtained. I will not discuss that. Take my terms, or leave them.'

'*Par dieu*, I shall do nothing of the sort. You shall give me the money, and trust to my honour to give you further time to pay the balance.'

'Rather a frail reed to rest upon,' said Rashleigh with a reckless laugh. 'Nonsense, Du Maurier. It is I to make terms; and, honestly speaking, I don't owe you anything. I think I am dealing very liberally with you—an opinion shared by more than one; indeed, Selby—you remember Selby?—says you are uncommonly lucky to get that.'

During this interesting conversation, Decie had remained in the hall to watch the progress of events; not that he anticipated failure upon Rashleigh's part, but that he was genuinely anxious that the lad should himself throw off the fetters which bound him. Failure was impossible, as Phil very well knew, so long as he had the whip-hand of the versatile Du Maurier. Still, if Rashleigh could assert his own independence unaided, it would be a great step towards a speedy regeneration.

While Phil was still pacing the hall, turning over these thoughts in his mind, a light footstep descending the stairs attracted his attention; and though there was only a dim light burning, he was enabled to distinguish the face and figure of Beatrice Rashleigh. There was a restless, troubled look in her eyes; but the face grew a trifle colder as she recognised Decie.

'Why did you not come with us to-day?' she asked. 'Oh, surely you must have misunderstood me. I do not wish to make your visit unpleasant.'

'Please set your mind at rest upon that score. My excuse was really no idle one; and so far as regretting the day's pleasure, my decision promises to be one of the most fortunate things I ever did in my life.'

Beatrice looked up surprised at the quiet ring of triumph in the words. She felt an irresistible impulse to remain with him, yet at the same time, woman-like, she blamed herself for this weakness. Like the moth fluttering round the flame, she could not keep from the dangerous lure.

'I am glad to hear it,' said Beatrice with a little sigh. 'Would you mind telling me where Gerard is? I suppose I may go into the billiard-room?'

'Well, I—I think I would wait a moment. He is in there with Du Maurier, only I fancy they are talking over some private business.'

Beatrice laughed lightly, the first sign of mirth Phil had noticed since they met, and crossed over to the billiard-room with a determined step. Regardless of Decie's entreaties, which only served

to increase her resolution, she threw open the door and took a step inside. One glance was quite enough. Du Maurier, his face flaming with passion, stood facing Rashleigh, the latter very white and agitated, but presenting a picture of quiet determination. So engrossed were they in their quarrel, that they were quite oblivious to the presence of the deeply interested spectators.

'Then what follows?' Du Maurier hissed through his clenched teeth. 'I go to M'sieu Decie and say to him I know who stole that bracelet. Can you guess?—No.—Then I will tell you. Rashleigh was the thief!'

'And what would he say?' Rashleigh returned unsteadily. 'He would simply tell you that he had known it all along. He has known it from the first.'

'Ah! you say so. And the little episode of the watch? The Philip Reid who raises money on his valuables'—

'Which was pledged for me. I was driven almost mad for the want of a little money. Decie was not the rich man then he is now. It was for me alone that money was obtained. It was to prevent my sister knowing what a miserable criminal I am, that caused Decie to sacrifice his happiness.—And now, do your worst.'

Decie, the first to recover himself, drew Beatrice back and closed the door unseen. Her face was white as marble, her limbs trembled under her; she would have fallen had he not put his arm round her. As their eyes met, hers soft, sorrowful, and pleading, his smiling tenderly, she found sufficient voice to speak: 'O Phil, what have I done to you? What a miserable girl I am! And to think that he—Gerard— Let me go. I cannot, dare not speak to you yet.'

With a fierce gesture of passionate *abandon*, she broke from the shelter of his arms and flew up-stairs with the speed of a hunted deer. Phil followed her with his eyes, shining with love and triumph, a feeling of wild exultation at his heart. Then, without further ceremony, he opened the billiard-room door and strode in with set determination of purpose.

'You need not go over that miserable business again,' he said, seeing that the Frenchman was about to speak. 'You seem to have lost your philosophic calm. I know everything you would say; but I think you will preserve that secret. Now listen to me. You will retire to your room without seeing any one to-night, and write a letter to Colonel Scobell saying that you are bound to leave by the 8.10 train to-morrow. You will also give Rashleigh the securities you hold. Nothing more need be said.'

'I have them already,' Rashleigh explained. 'As to the rest'—

'As to the rest, we shall meet again in Cambridge,' Du Maurier exclaimed. 'Then we shall see'—

'You will do nothing of the kind, for the simple reason that you will not return to that happy hunting-ground, where there are too many of your class already. You will take your name off the college books.'

'And if I refuse?'

'Refuse! You dare not!' Decie cried contemptuously. 'You have your money. Go, or I shall be tempted to give you the chastisement you deserve.'

With a gesture of impotent rage and one backward look of hatred, the baffled swindler left them. It was the last time either of them was ever to see *Horace Du Maurier*. When morning came, the gentlemanly chevalier had disappeared, leaving no trace and no regret behind.

Phil turned to *Gerard Rashleigh*, and held out his hand. 'I congratulate you heartily. You have done a wise thing, *Gerard*. It will be your own fault if you don't go straight from now. Let us say no more about it. The rest lies in your own hands.'

'There is one thing to be done,' *Rashleigh* returned, a new light in his eyes. 'Do not be too hard upon me, *Phil*. I will make the best atonement I can. Will you leave me for a moment to recover myself? I am quite unmanned.'

With a delicate innate sympathy, always so ready to measure the feeling of others, *Decie* left him, and passing through the open French window, stepped on to the tennis lawn. It was cool and quiet there under the cedars, bathed in the peaceful moonlight, the silence of night broken only by the occasional ripple of laughter from the drawing-room. *Decie* for the moment felt a need for silence and solitude, a peacefulness broken all too soon by the appearance of *Rashleigh*, and with him a figure that caused *Phil's* heart to give a quick leap and stop as if it were still.

'I have been telling her,' *Rashleigh* said abruptly.

Decie smiled and held out his hand. *Beatrice* stretched out both of hers with an impulse of mingled pity and sorrow. As *Phil* held the fluttering fingers in a firm grasp, he turned to hear what the penitent would say.

'I will not make any excuses,' he continued in a faltering unsteady voice. 'I—I took the bracelet, and *Phil* saw me. On my life, I had no idea that he would be suspected, or I would have cut off my right hand first.—But even when you were so foolish, *Beatrice*, he would not speak; he did not care for you to know how bad I was. Then *Du Maurier* got the whole thing out of me: the name I used, even the whole story how *Phil* pledged his watch to lend me money. Finally, he succeeded in obtaining the ticket. What use he made of it, you know better than I. You see I used the same name that *Phil* assumed, and so there was something suspicious about the whole thing.—Do not ask me to say any more. Forgive me if you can; to forget is impossible.'

'Nevertheless, we will try,' said *Phil* cheerfully. 'Only, do not elevate me to the rank of a guardian angel, when I have only been selfishly playing for my own hand. Your presentiment is quite right. I overheard your conversation yesterday, or how should I have known?—But there; we will say no more about it. Shake hands, old fellow; and repay me, if you owe me anything, by doing the same for some one else in due season.'

Rashleigh put out his hand silently, for he could not trust himself to speak. *Beatrice* freed her fingers from *Decie's* warm grasp, and throwing her arms round her brother's neck, kissed him. He turned and walked away in the broad moonlight, slowly, thoughtfully; but there was a higher carriage of the head, a more elastic step, and a new warm feeling of unaccustomed lightness and freedom glowing in his breast.

'*Phil*, you have done a very noble thing!'

Beatrice murmured at length. 'Will you crown it by forgiving me for my sinful folly?'

He passed his arm round her and drew her face close to his. For a time there was a long delicious silence as he looked into her troubled eyes. With all a woman's sweet hypocrisy, she asked for a favour she already had, but the sense of her self-humiliation was not the less precious for that knowledge.

'My darling, I am too happy to feel any soreness at present. I have found you again; that is enough for me. I daresay I ought to have been stern and haughty; to have taken my revenge and left you. But I am only human, and I shall love you all the days of my life.'

By-and-by others of the party wandered out into the perfect evening, strolling in the moonlight in twos and threes; but, with a certain electric sympathy, they kept at a little distance from the lovers. Presently, *Miss Edith*, with a white boating cap perched upon her fair head, passed by, and leaving her companion for a moment, tripped lightly across the lawn. 'It was not bad news, then?' she asked demurely.

'No, indeed,' replied *Phil* gaily; 'the very best in the world. I said you should be the first to know; but mind, it is a profound secret for the present. Though how long it will remain so,' the speaker continued, 'is quite another thing. Anyway, it's nothing to be ashamed of.'

'Ashamed of!' *Beatrice* echoed indignantly.—*Phil*, I believe I am the happiest girl in the world!'

THOUGHTS FOR THE THOUGHTFUL.

'We want thinking souls—we want them,' so wrote *Samuel Taylor Coleridge*. Now I wish (says a correspondent) to make a few remarks which may serve as Thoughts for the Thoughtful, and cause them, in this world of wonders, to awake to the wonders which surround them.

Let us consider for a moment the vegetable world. First of all, it is the only organism that can convert the inorganic world into life. Neither man nor beast can find nourishment directly from the earth. The beast finds its food in the vegetable, converting it into flesh, which, again, affords food to man and to all carnivorous animals. What a marvellous chemistry do we thus find in the vegetable, kindling the inorganic into life!—how subtle, how completely beyond our ken, no matter how keen our investigation. Nor is the animal chemistry less subtle, less marvellous, in converting the vegetable into flesh. Again, consider how simple and how like, if we may not even say how identical, are the constituents on which vegetable life feeds, and yet what marvellously different results! Think of the variety of flowers and of fruits—some sweet-scented, as the rose and the violet; others, disagreeable, as the garlic, the dunk-tree, and the wormwood. If we take a mere bud of a white rose-tree, and insert it into the stem of a red rose, forthwith it becomes incorporated in it. The root sends nourishment throughout the whole tree; but the same sap, passing up the different stems, results respectively in red and white roses. What a marvellous change the sap has undergone by only travelling up a different kind of wood! Think of the hard stones or nuts that are found in

the fruit of trees—the peach, the walnut, and the cocoa-nut. The conversion of sap into these hard nuts is indeed a piece of wonderful vegetable chemistry. Think, too, of the many useful medicinal, as well as hurtful and poisonous, plants that abound in every clime; all, remember, resulting from the conversion of nearly the same ingredients into the diversely different products. In a dry and thirsty land, too, where no water is, the cocoa-nut fills its shell with an abundance of delicious fluid. We cannot tell how it is done.

Now, let us turn our thoughts to the animal world. How wonderfully are animals built up—the lower, by the eating of vegetable food; the higher, by the eating of the vegetable converted into flesh. Think of the wonderful animal-chemistry that can convert green food into blood, flesh, hair, horn—into all the various requirements of the several parts of the body, and that without any will exerted by the animal to produce the several results. It is done whether the animal is asleep or awake. It is done unconsciously by the animal. What a variety of food and drink man occasionally takes at a meal, and yet the process of digestion separates the mixed mass into its several different results, producing hair, horn, and bone. What a wonderful conversion is that of vegetable matter into the ivory tusks of the elephant and the antlers of the deer and stag! We cannot find any material in hardness and elasticity equal to that of the tusk of the elephant for the making of billiard balls. What a wonderful product is the shell of the eggs of birds, and the shells of lobsters and crabs—produced simply from what they severally eat! Wonder reigns everywhere—in the air, the water, and the earth. Have my readers ever allowed themselves to wonder at the feathers of birds? How gorgeous and yet how artistic are the feathers in the tail of the peacock! All the feathers, remember, are made from what the bird eats. Again, life abounds in every variety of form, and exists under every variety of circumstance. We have fish sporting in the sea, birds floating in the air, and animals traversing land and sea. Some shell-fish, like the crab and lobster, have their skeleton outside their flesh; other fish, as the salmon and the cod, have their skeleton covered by the flesh. Some trees have their nuts covered by the fleshy fruit; others, like the tropical cashew, have the nut outside the fleshy fruit. Animals that occupy the land have invariably, I believe, the skeleton within the body.

The fecundity of nature, too, seems to be without limit. No circumstances, no matter how different, prevent her from giving effect to her operations. Life springs up on every side—on the land, in the sea, under the land, and in the air, so that the command given—'Let the waters bring forth abundantly the moving creature that hath life, and fowl that may fly above the earth in the open firmament of heaven; and let the earth bring forth the living creature after his kind, cattle, and creeping thing, and beast of the earth after his kind'—has been literally fulfilled. Let us consider, too, how diversified nature is—how, out of a few materials, she can produce endless variety. Take, for instance, the features of the human face: how few these are, and yet out of millions and millions of men how rarely, if ever, do you find two faces

in every detail alike. Again, consider in how many ways you can distinguish one man from another; the voice, the fall of the foot, the handwriting, all are different. So, too, with painters. No two painters paint alike. An expert connoisseur can easily distinguish the paintings of one master from another. Each man throws naturally into his voice, his walk, his writing, his painting, some portion of his own personality, if he is a true man. Mr Walter Besant, in his *Children of Gibeon*, says that even the lines of one man's thumb differ from the lines of every other man's. Nature never repeats herself. Consider the birds of the air: each species builds its nest after its own pattern; the eggs of each are marked differently; their notes are different; the taste of the flesh is different; the plumage is different. But more wonderful still is the difference in the vegetable world; no two leaves, even on the same tree, are exactly the same. The ordinary observer can see no difference in the faces of a flock of sheep, but the shepherd can tell one sheep from another. These dissimilarities are endless.

The more we allow our minds to dwell upon the wonders contained in this world, the more we are impressed with the might, the wisdom, the intelligence of that inscrutable Power to which we give the name of God. When our wonder culminates in our admiration of the complex construction of man, his hands as instruments adapted to every variety of work, and his brain so adapted as to guide his hands to the performance of that work, we readily exclaim with the poet Young: 'How wonderful is man! How passing wonder He that made him such!' All that I have written has reference to this world only. When we let our minds contemplate the grand universe of which our globe is a mere point in space, and its history a mere point in time, then, indeed, our wonder should be translated into a reverential awe.

THE AMONTILLADO.

It is true that I left Curry Lodge in a hurry—some might even term it in indecent haste—but could I, the most sensitive of men, remain after what transpired? Like Mr Wilkie Collins, I Say No.

It is also true that, a month or two afterwards, the following appeared in the marriage column of the *Standard*: 'April 20th, at Great Cromley parish church, by the Rev. — Tyham, M.A., BENJAMIN PUFFER of the Grange, Great Cromley, to ALICIA MAUD, daughter of Major Chumsett of Curry Lodge, Great Cromley.' Yes; there it was, in the plainest of type. It glared viciously at me, for it was the triumph of Puffer. Puffer, allow me to state, is a barrister. I have the consolation of knowing that he is a briefless one.

My name is Tattam Solomons, junior member of the firm of Hidalgo, Bibham, & Solomons, importers of Spanish wine. I received an invitation to visit the Major at Curry Lodge. I accepted it, and went. Alicia Maud was the magnet which drew me there. I arrived at the Lodge in a state of exhilaration; but misery seized me

directly my eye fell upon Puffer. I will not deny it—I hate Puffer. He not only boasts—in the most public manner—that I was his ‘fag’ at Eton, but he makes it a continual practice to address me as if I were a serf. I don’t like it. A very few days sufficed to assure me that I was not alone in my worship of the adorable Being who drew me to the Lodge; I had a rival, and that rival was Puffer.

Alicia Maud was the stake, and Puffer and I played for it. To my sorrow, it soon became apparent that Puffer was pegging most of the holes. He had that peculiarity of the ‘Devil’s Own,’ of always painting himself a Solomon, and every one else an ass. I saw that he was making a deep impression upon the Major, if not upon Alicia Maud. At length he attacked me, so to speak, in my own vineyard; he boasted of his knowledge of wine—sherry especially. A worm will turn—I turned; I said ‘Pah!’

Puffer smiled. ‘Very well,’ he said. ‘Come over to the Grange to-morrow with the Major and try my Amontillado. If you have tasted better, I will pay five pounds to an Asylum for Idiots. If not, you shall pay it instead of me.—Agreed?’

I answered exultantly that it was; though, if my taste had been consulted, I should have preferred any other charitable institution. My rival, I may here remark, was the younger son of one of the Great Cromley magnates—a county magistrate.

The next day the Major and I walked over to the Grange. It was not far, for Cromley was little more than a village. Puffer awaited us. We were ushered into his room, and gravely we took our seats beside his mahogany; the Jury of Three was complete. The Amontillado I noticed was already on the table. With—I am sure I noticed it—a shaking hand, Puffer filled the glasses. We all solemnly and almost simultaneously raised the wine to our lips. Puffer immediately afterwards gave a loudish and vulgar smack. The Major was more cautious. I glanced at him, and saw that he had cocked one eye, and was looking through what remained in his glass with the other. With a husky voice, Puffer asked us for our verdict. The Major coughed uneasily and gazed at me. I was quite calm and collected, for I had sentenced the Amontillado, without trial, before I came there. Not for the sake of the paltry five pounds—Oh dear, no! It was a duty I owed to myself and Alicia Maud.

‘Puffer,’ I said slowly and with judicial emphasis, ‘you have been taken in: this is not sherry.’

The Major started as if I had thrown the decanter at him. He pushed away his glass as if it contained arsenic. Puffer’s face assumed that aspect of imbecile incredulity common to members of the bar when their case is hopeless.

‘This liquid,’ I went on, ‘to which some unscrupulous firm has given the name of Amontillado, is largely adulterated with the villainous German potato spirit, and is quite unfit for human consumption. I believe,’ I added supremely, ‘that I know what I am talking about; I am considered to have a tidy palate.’

The Major, who had been looking at the sherry with marked aversion, was beginning in an apologetic tone to take part in the debate, when Puffer suddenly interrupted him. ‘Enough, Major,’ he cried. ‘I have lost. Mr Solomons is, as he has told us, an experienced judge, and I stand by his verdict. I owe the Asylum five pounds.—Yet,’ he said musingly, ‘it is a pity.’

‘What is a pity?’ I asked eagerly, for I thought he meant that he was sorry to part with his money.

‘Why,’ he answered blandly, ‘that a hitherto irreproachable firm of wine-merchants should so deceive me.’

‘It’s a confounded shame!’ cried the Major warmly, ‘and social ostracism is too good for ‘em.—Who are they, Puffer?’

Puffer made no reply, but placing his hand in a side-pocket, he drew out a bill-head and passed it to the Major. The latter fixed his glass in his eye and began to peruse it. Almost directly he stopped and looked round at us with an air of the most intense bewilderment. He drew a deep breath. ‘Hang it!’ he exclaimed helplessly, ‘it can’t be.’ He looked at us again, and his stock perceptibly stiffened. ‘Gentlemen,’ he said in an awful voice, ‘you must excuse me;’ and without saying another word, he got up, opened the door and left us.

What *did* it mean? I glared wildly at Puffer, and with a cool smile he pushed the bill-head over to me. A glance at it told me all—the firm from which Puffer had bought the Amontillado was that of Hidalgo, Biblam, & Solomons!

THE MONTH:

SCIENCE AND ARTS.

‘It is a little vanity of no harm, and may tempt others to follow my example, in thinking more of the nation and less of themselves.’ These noble words occur in the will of Mr William White, who died in the year 1823, and they refer to his wish that the large sum which he left to the nation for enlarging the British Museum should be utilised on the condition that the new buildings should bear his name. The money fell in nine years ago, and what is called the White wing of the Museum is now opened to the public. It gives accommodation to a great many exhibits which for want of space were previously hidden away. Among these are the glass and ceramic collections, and the Chinese and Japanese drawings, all of which are of the greatest interest. The Japanese work is especially worthy of careful study; and there has of late years been such a mania among art students and collectors for everything of Japanese character, that these splendid examples are sure to attract many visitors. Perhaps the most interesting series of drawings in the gallery is that by an unknown painter of the seventeenth century. It consists of twenty-three pictures which illustrate one of the most familiar of Japanese tales. The pictures describe the search for and destruction of an ogre or demon by

a hero of the name of Raikō. The date given to this wonderful story is 947 A.D., and it reminds us of one of the wholesome old-fashioned fairy tales of our childhood. These drawings exhibit the usual careful and delicate work peculiar to the Japanese, together with brilliant colouring; and they show also a wonderful play of fancy on the part of the unknown artist. Visitors to London should not fail to see these new galleries.

The smallpox epidemic at Preston, which is of a very serious character, has brought forth a great many suggestions from different sources. Vaccination and re-vaccination, the efficacy of which has been abundantly proved, have been going forward rapidly; but it has been necessary to postpone many public meetings, and more than one school has had to be closed. Among the recommendations which have been published is one from Mr Rollinson, a sanitary engineer, who urges the advisability of removing smallpox patients from buildings, and providing sheds or huts of a temporary character for their accommodation. He urges that by this treatment the patients can be surrounded with fresh air, care being of course taken to prevent exposure to direct draughts. He tells us that he has seen smallpox patients placed under open sheds and barns in the summer-time sleeping on straw and nursed by cottagers; the result being that not one patient so treated died, neither did the disease spread. The advice given is worthy of careful consideration by our civic authorities. We are all too prone as a nation to look upon fresh air as an injurious rather than a health-giving agent.

It has often been reasonably contested by inventors and designers that Exhibition honours should be awarded to them, and not to those by whom, by an accident of fortune, their products are exhibited. An effort in this direction is represented by an Exhibition of Arts and Crafts which will be open in London during next October. All exhibits here will be shown under the name of the designer. The Society which has been formed for the promotion of this worthy scheme includes names of many well-known artists. It will not undertake the sale of any work exhibited, but will refer intending purchasers direct to the exhibitors. The products shown will consist of textiles, metal and iron work, gold and silver smiths' work, decorative painting, bookbinding, wood and stone carving, &c. Further information can be obtained of Mr Radford, the Secretary, at 121 Regent Street, London, where the Exhibition will be held.

A sad but interesting relic of the lamentable Zulu war has recently come to light: this is the back of the gold case of a watch, which, by the number stamped upon it, as well as the crown and monogram of N, is proved by its makers, Messrs Dent & Co., to have belonged to the Prince Imperial of France, who lost his life in that campaign. It seems that this memento of the unfortunate Prince was purchased about six years ago from a Zulu at Kimberley, Africa.

Particulars have been sent to us of a useful and new invention by Mr St John Allison of Parracombe, North Devon. This invention consists in a method of using common galvanised iron for the

covering of hay and corn ricks. These metal sheets rest upon wooden beams, which are so made that they will admit of necessary ventilation, and will also allow the sheets to slide one over the other as the rick subsides. The cost of this covering, including all fittings, is about equal to the cost of thatching for five or six seasons. But it is represented that as the iron will last about six times that time and can be so readily applied, its use will represent an economy as well as a convenience to agriculturists. We presume that the inventor has foreseen the necessity of connecting the metal plates with the earth, so as to prevent danger from lightning.

According to an American Homœopathic Journal, the passion-flower has a great therapeutical value, and is one of the best hypnotics known. It is said to produce a quiet pleasant sleep, different from the stupor of many better-known narcotics, and from which the subject can be awakened at any moment. In the worst forms of insomnia this drug is said to produce quiet refreshing sleep, and is of great value in the treatment of Tetanus and other diseases.

An ornithological occurrence of interest is the visit of a fine cormorant to the heart of London. This stranger, which may in truth be described as *rara avis*, was found in St James's Park on the 30th of May. He was tame and hungry enough to accept food from the keepers. The same bird was noticed some days later flying over the Serpentine water in Hyde Park.

We lately had the opportunity of inspecting a very wonderful machine called the Cyclone Pulveriser, which has the power of reducing to impalpable powder the hardest substances brought within its reach. It seems that the inventors of this machine derived their original ideas of its structure from observing the great havoc caused in many parts of America by cyclone storms. It consists essentially of an iron box, in which two powerful cast-iron fans face one another, with a few inches between them. These fans are not unlike six-shafted screw propellers, and are not more than a foot in diameter. They are caused to rotate in opposite directions at about two thousand revolutions per minute, air being admitted to them from two apertures behind each. In the space between these powerful blowers an artificial cyclone is created, and into this miniature storm the material to be pulverised is fed, with the curious result, that although it does not touch the iron blades—and this is proved by their freedom from scratches or dents after months of work—the particles of the material are torn asunder and pulverised by attrition among themselves. At the time of our visit the machine was breaking up an extremely hard ore, which was quickly reduced to the finest powder. By a system of screens attached to the machine, the powdered product is delivered in several grades of fineness. The Cyclone Pulveriser has been in use for some time in America, but has only just been introduced into this country, where it will probably be found useful in a great many industries.

We glean from the *Newcastle Weekly Chronicle* some interesting results of Dr Wagner's experiments on the value of basic slag as a manure. It is found to be more economical and better in every way than such old-fashioned manures as

guano, bone, or coprolites, and is far cheaper. The slag is found to be particularly suitable for grass, clover, and lucerne, and acts well on most soils.

Sir Thomas Brodie has recently arrived at Hobart, Tasmania, with a quantity of salmon ova in splendid condition. These ova were kept on the voyage out from Ireland in a special ice-house; and owing to the care with which they were treated, the loss has only been one per cent. out of four hundred thousand. Many of the ova were hatched during the voyage, and the young fish remained alive and vigorous on board ship. Sir Thomas also took some larger fish with him, but they died directly the tropics were reached, owing, it is supposed, to their having been deposited in London water instead of their native element. It is gratifying to learn from another source that the salmon ova introduced upon a former occasion into the Tasmanian rivers have answered expectations. A large salmon, the product of former consignments, has recently been caught in one of these waters.

A great many suggestions have been made from time to time for 'deafening' floors, as the process is named. Among the substances used have been sawdust, dry ashes, cork-chippings, &c.; and many different things and compounds have been found buried in the floors of old houses for the purpose of deadening noise. The last suggestion of the kind comes from a French journal, and consists in filling the space between the floors with wood-shavings which have been dipped in a tub of thick whitewash. This treatment, it is said, would render the shavings quite incombustible, and would at the same time form an excellent non-conducting material to sound. It is also suggested that where it is desirable to disinfect the space between the floor and ceiling, as in hospitals, the shavings may be saturated with chloride of zinc, or this salt may be added to the whitewash. This plan would have the advantage of not increasing the weight of the floors to any appreciable extent.

We are all interested in the progress of electric lighting; and as we have often been told that its cost is a great obstacle to its general introduction, certain particulars given in the annual Report to the Science and Art Department of the Privy Council regarding the electric lighting of the South Kensington Museum, will be read with interest. The working expenses of the electric light at this large building amounted last year to £1224, and it is stated that if gas had been used instead, the cost would have been more than double. If these figures be correct, it is clear that public buildings generally will soon be lighted by the new lamps, even if dwelling-houses must for the present be content with a weaker illuminant. We may mention in connection with this matter that on one night lately many buildings in the west end of London were suddenly thrown into darkness by the extinction of their electric lamps; and this failure was attributed by consumers to some deficiency in the system employed. But the Secretary of the Electric Lighting Company who furnished the lamps has given the real cause of the disaster. It seems that the stokers employed deserted their posts and allowed the fires feeding the engines to go down. These men 'took offence that a gra-

tuitous meal of roast beef, &c., was served to them cold instead of hot!'

A new lifeboat has recently been tried with success at St George's Dock, Liverpool. This boat is built of galvanised steel sheets, is sixteen feet in length, with a beam of five feet. When not in the sea, the boat can be used as a deck seat; but directly it is lowered into the sea, it is transformed into a boat capable of holding from twenty-five to thirty passengers. It is furnished with water-tight compartments, which are so built that they can be used for storing food and other necessities. It is said that in whatever position the boat reaches the water, it will instantly right itself and be available for use. Another life-saving device likely to be of value is a raft-buoy which has been invented by a United States naval officer. This buoy is big enough to support the weight of a man, and is during use attached to the vessel by a long wire-rope. It contains a supply of provisions, and is furnished with a chemical lamp which upon contact with the water ignites and burns brilliantly for about twenty minutes. In the case of a man falling overboard, this buoy would be immediately thrown into the water, and the light would guide him to its whereabouts. Should he reach it, he would be drawn by the wire-rope to his ship; but should the line from any cause break, the provisions carried by the buoy will enable him to sustain life for a time, and so give him another chance.

From some recent experiments on the Lake of Geneva, it is found that its water is far clearer in winter than in summer, owing to contamination during the latter season by suspended matter. In the winter-time, white discs, submerged, can be seen to the depth of twenty-two yards; while in summer they cease to be visible at a quarter of that depth. It is also found that photographic action, which extends to a depth of nearly fifty yards in summer, is increased to over one hundred yards in winter.

A new application of photography has been made in France by M. Weddiny. Microscopical examination of steel shows that it is composed of an agglomeration of crystals, and the quality of the metal may be determined very accurately by the difference in appearance of these crystals. The experimenter referred to, in order to render the observation more complete, heated the steel under examination until it was white-hot; but as these conditions prevented the use of the microscope, he photographed the white-hot metal, and then examined with the microscope the negative so obtained.

M. Pasteur's inoculation system has recently been tried at Odessa as a preventive of the Siberian cattle-plague. One hundred merino sheep have been inoculated, and so far with the most hopeful results, although time is of course required to prove the value of the treatment in this disease. Should Pasteur's method succeed, it will be a great boon to the whole of Southern Russia. In a single province it is stated that the losses to proprietors by this plague have amounted to more than three millions of roubles; and its annual recurrence has brought poverty to numbers of peasant proprietors and owners of sheep and cattle runs.

Although we no longer hide our savings in stockings, as our forefathers used to do, it is astonishing how much gold in the shape of coins

is laid by and out of use in the cabinets of collectors. It has been calculated, for instance, that the result of issuing a Jubilee coinage has been to withhold from circulation about half a million of gold. The Mint lately issued a quarter of a million pounds-worth of five-pound pieces, and nearly the same value of two-pound pieces, and these are never seen except as curiosities in the collector's cabinet. It is also certain that a number of minor coins will be also preserved as memorials of the Jubilee year.

An interesting account of a new process for preserving wood was lately given in a paper read before the Western Society of Engineers, Chicago. The method referred to is known as the Zinc-creosote process, dead oil and chloride of zinc being the active agents employed. It is specially suitable for railway sleepers, bridge-timbers, and for situations where wood is exposed to any great degree of moisture. The timber is first of all steamed in a vacuum; the oil is then injected into the cylinder in which the wood is placed; after which the chloride of zinc is applied by pressure. It is said that the oil penetrates the pores of the wood to a certain extent, and the chloride of zinc goes to those portions unreachd by the oil. According to the writer of the paper, Mr J. P. Card, the method will give the best results of any process for the money spent.

A new antiseptic has been recommended by Dr Schneider. It consists of one part carbolic acid, in crystals, to three parts of camphor well incorporated together. This mixture is said to possess all the good qualities of carbolic acid, while its irritating and caustic properties are removed and its peculiar odour considerably modified.

We some time ago referred to the grand scheme of charting the stars, which originated at Paris. Twelve observatories will be ready next year to commence upon the work, and other observatories are only waiting for funds for the necessary instruments. According to the Report of the Astronomer-royal to the Greenwich Board of Visitors, the Treasury has not yet decided whether Greenwich is to take part in this international work, and a question since asked in the House of Commons elicited the information that the matter was still under consideration. We trust, for the credit of British science, that the comparatively small sum required will not be withheld.

A lecture was lately delivered in London by Mr Julius Wolf upon that distressing affection known as Writers' Cramp. The lecturer has achieved great success in Germany and in other continental countries by his treatment of this disease, the cure for which has hitherto baffled medical science. This treatment consists in the subjection of the affected muscles to massage, a treatment which includes a variety of manipulations, such as stroking, pressing, kneading, rubbing, &c. Many writers and pianists who have been victims to this painful muscular affection will be glad to hear that this treatment has been in most cases found successful.

A curious trial, which was designed to test the speed of the telegraph as against the telephone, was recently undertaken at a newspaper office in New York. The test was between New York and Boston, and lasted ten minutes. In this short

period, Boston received three hundred and thirty words by telegraph ready for the printer; while at the same time three hundred and forty-six words were transmitted by telephone; but as many of the words sent by the latter instrument were incorrectly received, the telegraph was declared the victor.

An artificial chamois leather has been introduced by Messrs Hothersall of Manchester, who claim that the fabric is superior to that which it imitates in remaining supple after immersion in water, and being in other respects more serviceable than the real article. From an examination of the specimens sent to us we can endorse the favourable opinion. The material is in appearance exactly like leather, and can be produced at a much lower price. It will be found serviceable for the thousand-and-one uses to which wash-leather is applied.

Professor Netts of Dresden is said to have discovered a new method of making aluminium, which has recently been patented in this country. The ore used is cryolite, which is ground to powder, and after being mixed with common salt, is melted in a furnace. Sodium is now added in such a way that its vapour rises through the molten mass and displaces a part of the aluminium contained in the ore, which ultimately appears in the metallic form. Three and a half pounds of sodium so added are necessary to the production of one pound of aluminium. The new process as published seems to bear a great resemblance to the method of obtaining aluminium which was perfected by Messrs Bell of Newcastle many years ago.

SONNET.

I SAW her once, once only, long ago;
Yet now she often comes to me by night
Known by the hair, so silken-soft and bright,
That veils warm cheeks where crimson roses throw
A tender flush o'er pallid lily-snow.
She speaks not; only her golden head is light
Above my heart, that throbs with wild delight—
Dreaming she takes the love she cannot know.

Dear distant love, doth some sweet spirit-voice
Breathe in thine ear, when slumber is most deep,
All I were fain to tell if we should meet?
And dost thou come, because the word is sweet,
By shadowy paths we tread not save in sleep,
To bid me trust the future, and rejoice?

** TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

PRICE 1½d.

A SUNSET CRUISE.

THERE is no prettier picture in this world than a smart cutter going free, when a fresh breeze sends her swishing through the waves like a veritable ocean nymph. And such is the *Pride*, bowling bravely down the upper reaches of Morecambe Bay; her sharp stem cutting through the wavelets which hiss past her smooth white sides, and stream away aft in a long wake of bubbling foam; whilst her lee scuppers are all awash as she heels over under a sky-scraping topsail. But never a white-winged yacht yet had such a crew as the witching maidens who are clustered on her weather quarter; nor was ever any tiller held by daintier hands than those of the handsome naïad who is at the helm, steering deftly 'full and bye' with many a toss of her sun-glinted head as the mischievous zephyrs flutter swinging locks of waving hair about her winsome face.

The sinking sun is flushing the western horizon a deep rich pink, and throwing long slants of primrose light across the dancing water. He has left the distant Yorkshire hills to slumber in purple shadow, and his fleeting beams have slipped silently over the bowed head of Arnside Knot and are racing down its steep wooded slopes, eager to reach the golden sands below and welcome the cutter as she stands out from the curving shores of Grange across towards Holm Island, in whose rocky chasms and clefts the water laps and sighs, like the sobbing of sorrowful mermaids imprisoned in the depths below; whilst the trees which crown its steep slopes form a dense background to a so-called temple of Vesta which gleams a gray beacon upon the outermost point. Beneath, the tide runs like a mill-race, and swirls round two islet crags standing like outposts to warn the pilot of shoaling waters.

'Ready!'

'About!'

Snowy arms of exquisite rounding put the tiller hard down, the long boom swings over, soft dimpled hands haul in the jib and foresail sheets, and the *Pride* sweeps round in a magnifi-

cent curve; then, with a coquettish shake of her topsail and a coy quiver at her mainsail's throat, she springs forward on her new course.

Away on the port beam is Silverdale, whose fine new red-tiled church stands like a sentinel on guard at one end of the long straggling village, where the houses are dotted up and down in picturesque disorder, and seem on fire as the sunset glows upon the window-panes. Farther on, the distant furnaces of Carnforth flicker and shoot up their lurid flame-wreaths high into the clouds; recalling somewhat the days of old, when the beacons blazed fiercely to warn the country-side of the coming foe. Beyond, the line of the land runs low for miles, and a flashing diamond marks where the sunlight catches the glass roof of the Winter Gardens at Morecambe, the Margate of the north.

'Keep her away.'

The mainsheet squirls melodiously as it is eased a trifle, and away she slips over the tide full towards the setting sun, whose last rays wrap the sweet *damoiselles* in soft golden light, and sparkle in the bright eyes of the skipper-maiden.

Little recks the *Pride*, as she glides on, of the treacherous sands below her keel, for ten feet of water is over them, and hours will elapse before their dread banks gleam wet and drear under a chill moon. But dry they will before the night is old, for between each tide Ocean draws himself back, and leaves a vast plain of a hundred thousand sandy acres filling this noble estuary, over which the river Kent winds a shallow channel. Before the Furness Railway was built along its shores, the main road from Lancaster to the north crossed this dreary plain, a distance of from seven to eleven miles, according as the currents shifted the banks. A dismal and dangerous track enough, as the registers of neighbouring churches show—Cartmel alone recording the burial of one hundred and twenty bodies, out of whom the life had been battered by the sea as it swept over the cruel sands; for here the tide does not flow gently, darting forward for a dozen paces, and then half shyly drawing back, as if undecided

whether to advance or not ; but it dashes on with a defiant heave, and rushes resistlessly and pitilessly in a curling wall of water, carrying everything before it ; and woe to the loiterer overtaken, or to the craft whose moorings are not strong ! A hush falls upon laughter-loving voyagers as the pilot tells how one fatal night a bridal party set out to cross from shore to shore, and were drowned in a deep sullen pool into which they floundered. Once, too, a stagecoach sank out of sight for ever in the greedy quicksands, taking down with it all the doomed passengers and struggling horses. If venturesome folk will look, they may see in the wreathing storm-mists dread figures—so it is said—wandering up and down, and rushing madly to or fro—the ghosts of those who have lost their lives on the sands—and above the howling of the gale and in the moaning of the sea may hear the cries of drowned men ; though unbelieving scoffers aver that they are nothing but the shrill screams of seabirds.

But whilst the 'watch below' have been spinning yarns, the fair 'helmsman' has been skilfully keeping away over to the northern shore, and now close on the starboard hand is Humphrey Head, from whose crest one of the loveliest views of mountain and of sea can be seen.

'Luff! lady, luff!'

The cutter comes up smartly into the wind, the sails flap, her way stops ; the dingey which has been towing madly astern is hauled alongside, and into it the crew are piped. But somehow the *Pride* falls off, fills, and forges ahead, and the bo'sun has to let go his hold of the cutter's quarter to prevent her dragging the little boat under ; and away she stands, leaving one fair 'hand' and himself adrift.

'What fun to leave them.'

But milder counsels prevail ; the cruiser is gybed, and bears down upon the castaways, who little think, as they scull three pretty passengers ashore, how near they have been to pulling all the way home up the bay. Running the boat on to a shelving slab of limestone and hauling her out of the tide, the crew scramble up through the thick hazel woods and under stunted oak-trees, where the rabbits scamper and dive into the honeycombed turf, on to the long rolling ridge.

Rising up in a smooth rounded slope on its eastern side, Humphrey Head shows a bold precipitous front to the westward, buttressed by great tumbled rocks, against which the waves are breaking ninety feet below with a muffled roar like distant thunder. In the face of the cliff is a great jagged archway, leading to the Fairies' Cavern, a somewhat dolorous rendezvous for light-hearted joyous sprites ; and beneath it on the shore, a so-called Holy Well, to which of old the Cumberland miners used to resort and hold high carnival as they drank its waters to cure the ill effects of lead-poisoning. But it is the grand prospect from the summit of

the Head which repays the climb. To the right lies Morecambe Bay, circled by wooded shores and rounded knolls. To the left is the estuary of the Leven, alternately a waste of melancholy sands and a great reach of heaving water, as the tide is out or in. To the north, and immediately beneath, stretches a narrow plain, shut in at the northern end by the great beech-trees of Holker, his Grace of Devonshire's favourite seat, and having in the foreground the ancient tower of Wraysholme, where once the knightly Herringtons dwelt. Then away beyond, far as the eye can reach, are the glorious mountains of the Lake-country. On the right flank is Conistone Old Man, looking bare and bold, with Wetherlam beside him ; then the ragged crest of Scafell, with a suspicion of Great Gable just beyond. Nearer the middle of that wall of crags, the Langdale Pikes tower up against a band of ruby cloud ; and then dauntless peaks and rugged ridges die down to the great hollow of Dunmail Raise, which bends low, to let the coach-road to Keswick pass over its neck, and then rises up to greet the 'dark brow of the mighty Helvellyn,' and make obeisance to the calm and dignified Fairfield. There they stand, those grand old giants, calmly gazing out across the world below them, utterly heedless of the clatter and racket, the hurry and bustle of that puny creature man ; silently bidding him look up from the dull level of routine and custom, and climb steep paths to heights of loftier and nobler manhood.

But the sun has long since sunk into the western sea, and the uplifted heads of those everlasting hills are growing gray and grayer in the rich afterglow, which is fast changing from crimson to ruddy orange, and fading into pale primrose ; and it is time to get down to the beach and aboard the cutter, which is standing off and on waiting for her boat.

A few minutes more and the *Pride* is away on a homeward course, the water coming merrily over her bows in sheets, as, with another fayre hand doing her 'trick at the helm,' she drives gallantly at the white-capped surges, rushing up their curving fronts, leaping their tumbling crests, and plunging down into the hollows with maddening glee, scattering the sparkling spray ; whilst the wind laughs in the taut shrouds and running rigging.

Suddenly a vessel looms out of the gloom to windward, her black hull and dark sails giving her an uncanny look ; and the absence of any sign of living being aboard, and the grim silent way she glides astern, recall that weird tradition of the Flying Dutchman. Readers of Marryat's *Phantom Ship* are of course familiar with the story of Captain Vanderdecken, who impiously swore that he would round Cape Horn in his brig if it took him until doomsday to do it, and is therefore condemned to sail for evermore with a fell crew of lost souls and to haunt the storm-lashed seas. But the crew of the *Pride* fear not their spectre-looking neighbour, for she is no supernatural brig or haunted lugger, but a staunch sloop with trawl-net down, drifting on the top of the ebb, which has begun to set.

The wind is falling with the tide and hauling

more into the north ; so the sheet is paid out, and the cutter, lifting herself with an easy roll, glides on an even keel with the boom well over her quarter. The daylight has altogether died ; the stars are twinkling faintly in the steel-blue sky, and a young moon is hanging her horns in the south-western heavens and bathing the crags of Yewbarrow and its fretted plume of waving fir-trees in soft splendour. The fitful breeze, laden with the scent of juniper bushes from the land, lingers round the hushed group on the moonlight deck, loth to waft them onward out of its reach ; and shyly kisses damask cheeks and toys with soft dusky hair, until it almost forgets to give bare steerage-way to the cutter, though the pilot cheerily 'whistles for the wind.' When and where did this popular superstition first take hold of the nautical mind ? All the world over and for generations, sailors have believed that a breeze can be thus induced, though in many localities this musical charm is banned as likely to produce too much of a good thing. On the Yorkshire coast the fisher-folk do not like to hear any whistle aboard their boats, for they say it brings both bad winds and bad luck ; though Filey men will do so when the 'wind is asleep,' to waken it. Around St Ives it is held to be unlucky to pipe up at night ; and Irish fishers are careful to abstain from whistling if they happen to be in a dangerous spot, lest a gale should spring up and catch their boats there. Nor is it only uneducated minds which are affected by these beliefs, for there is a certain gallant commander of one of Her Majesty's ships, on whose breast hangs a long row of medals, who, easy-going in many things, will yet never allow his blue-jackets to whistle about the decks, for it 'never brings any good.'

Nor are the lower orders of creation without their influence on the weather, so old salts believe—curlews, porpoises, and dogs, to wit ; and yet they all yield the palm in this respect to the domestic cat. Why she should exert such a baleful power it is hard to imagine ; yet certain is it that the crew of many a lost ship have distinctly traced their misfortunes to feline influence ; and one only needs to recall one or two of the commoner phrases current in the forecabin to see how intimately puss is associated with nautical creeds ; such, for instance, as a 'cat's-paw' of wind, 'cat's-nap' (of sleep), 'cat's-lap' (weak tea), 'raining cats and dogs,' 'cats can smell the wind.' Some one has ingeniously suggested that Friday is an unlucky day because of its being dedicated to the Norse goddess Frigg, whose favourite attendants were cats.

But both hostile and friendly wind-spirits are alike out of call to-night, and the yacht seems as though she never would round Berner's Point, and the minutes slip away fast ere she gets it well abeam and opens the lights of Grange, shining out from the dark hillside in long quivering paths of brightness upon the gurgling tide. At last the shadowy pier looms out eerily from the dim wave-washed beach, and the *Pride* steals past it to her moorings just beyond. There is the plunge of an anchor, a rattle of the cable over the bows, a squeaking of blocks, a squirling of running ropes, a flapping of canvas, the sound of oars in the rowlocks, a gentle plashing of unseen waters, the grating of a boat's keel on the

sand, then a musical chorus of 'good-night,' white figures vanishing into the silver haze, and our sunset cruise has become but a golden memory of the past.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XXXVII.—PROVING HIS CASE.

At the *pension* Hugh had engaged in haste a dull private sitting-room on the second floor, with bedroom and dressing-room adjoining at the side ; and here he laid Winifred down on the horse-hair sofa, wearied out with her long journey and her fit of delirium. The waiter brought her up refreshments on a tray, soup and sweetbreads and country wine—the plain sound generous Ligurian claret—and she ate and drank with an apparent avidity which fairly took her husband's breath away. The food supplied her with a sudden access of hectic energy. 'Wheel me over to the window,' she cried in a stronger voice to Hugh. And Hugh wheeled the sofa over as he was bid to a point where she could see across the town and the hills and the villas and the lemon-gardens.

It was beautiful, beautiful, very beautiful. For the moment, the sight soothed Winifred. She was content now to die where she lay. Her wounded heart asked nothing further from unkind fortune. She looked up at her husband with a stony gaze. 'Hugh,' she said, in firm but grimly resolute tones, with no trace of tenderness or softening in her voice, 'bury me here. I like the place. Don't try to take me home in a box to Whitstrand.'

Her very callousness, if callousness it were, cut him to the heart. That so young and frail and delicate a girl should talk of her own death with such seeming insensibility was indeed terrible. The proud hard man was broken at last. Shame and remorse had touched his soul. He burst into tears, and kneeling by her side, tried to take her hand with some passing show of affection in his. Winifred withdrew it, coldly and silently, as his own approached it. 'Winnie,' he cried, bending over her face, 'I don't ask you to forgive me. You can't forgive me. You could never forgive me for the wrong I've done you. But I do ask you, from my soul I do ask you, in this last extremity, to believe me and to listen to me. I did not lie to you last night. It was all true, what I told you in the *coupé*. I've never intrigued against you in the way you believe. I've never deceived you for the purpose you suppose. I've treated you cruelly, heartlessly, wickedly—I acknowledge that ; but oh, Winnie, I can't bear you to die as you will, believing what you do believe about me.—This is the hardest part of all my punishment. Don't leave me so ! My wife, my wife, don't kill me with this coldness !'

Winifred looked over at him more stonily than ever. 'Hugh,' she said with a very slow and distinct utterance, 'every word you say to me in this hateful strain only increases and deepens my loathing and contempt for you.—You see I'm dying—you know I'm dying. You've tried to hound me and to drive me to my grave, that

you might marry Elsie.—You've tried to murder me by slow degrees, that you might marry Elsie.—Well, you've carried your point: you've succeeded at last.—You've killed me now, or as good as killed me; and when I'm dead and gone, you can marry Elsie.—I don't mind that. Marry her and be done with it.—But if ever you dare to tell me again that lying story you concocted last night so glibly in the *coupé*—Hugh Massinger, I'll tell you in earnest what I'll do: I'll jump out of that window before your very face, and dash myself to pieces on the ground in front of you.'

She spoke with feverish and lurid energy. Hugh Massinger bent his head to his knees in abject wretchedness.

'Winifred, Winifred, my poor wronged and injured Winifred,' he cried at last, in another wild outburst, 'I can do or say nothing, I know, to convince you. But one thing perhaps will make you hesitate to disbelieve me. Look here, Winifred; watch me closely!'

A happy inspiration had come to his aid. He brought over the little round table from the corner of the room and planted it full in front of the sofa where Winifred was lying. Then he set a chair close by the side, and selecting a pen from his writing-case, began to produce on a sheet of note-paper, under Winifred's very eyes, some lines of manuscript—in Elsie's handwriting. Slowly and carefully he framed each letter in poor dead Elsie's bold and large-limbed angular character. He didn't need now any copy to go by; long practice had taught him to absolute perfection each twist and curl and flourish of her pen—the very tails of her *g*'s, the black downstroke of her *f*'s, the peculiar unsteadiness of her *s*'s and her *w*'s. Winifred, sitting by in haughty disdain, pretended not even to notice his strange proceeding. But as the tell-tale letter grew on apace beneath his practised pen—Elsie all over, past human conceiving—she condescended at last, by an occasional hasty glimpse or side-glance, to manifest her interest in this singular pantomime. Hugh persevered to the end in solemn silence, and when he had finished the whole short letter, he handed it to her in a sort of subdued triumph. She took it with a gesture of supreme unconcern. 'Did any man ever take such pains before,' she cried ironically, as she glanced at it with an assumption of profound indifference, 'to make himself out to his wife a liar, a forger, and perhaps a murderer!'

Hugh bit his lip with mortification, and watched her closely. The tables were turned. How strange that he should now be all eager anxiety for her to learn the truth he had tried so long and so successfully with all his might to conceal from her keenest and most prying scrutiny!

Winifred scanned the forged letter for a minute with apparent carelessness. He had written over again from memory the single note of Elsie's—or rather of his own in Elsie's hand—that Winifred had never happened at all to show him—the second note of the series, the one he despatched on the day of her father's death. It had reached her at Invertnar Castle, redirected from Whitestrاند, two mornings later. Winifred had read the few lines as soon as they arrived, and then burnt the page in haste, in the heat and flurry of that tearful time. But now, as the letter lay before her in fac-simile once more, the very

words and phrases came back to her memory, as they had come back to Hugh's, with all the abnormal vividness and distinctness of such morbid moments. Ill as she was—nay, rather dying—he had fairly aroused her feminine curiosity. 'How did you ever come to know what Elsie wrote me that day?' she asked coldly.

'Because I wrote it myself,' Hugh answered with an eager forward movement.

Winifred looked hard at him, half doubtful still. Could any man be quite so false and heartless? Admirably as he acted, could he act like this? What tragedian had ever such command of his countenance? Might not that strange story of his, so pat and straight, so consonant with the facts, so neatly adapted in every detail to the known circumstances, perhaps after all be actually true? Could Elsie be really and truly dead? Could ring and letters and circumstantial evidence have fallen out, not as she conceived, but as Hugh pretended?

'I can't make my mind up,' she muttered slowly. 'It's hard to believe that Elsie's dead. But for Elsie's sake, I hope so! I hope so!—That you have deceived me, I know and am sure. That Elsie's deceived me, I should be sorry to think, though I've often thought it. Your story, incredible as it may be, brings home all the baseness and cruelty to yourself. It exculpates Elsie. And I wish I could believe that Elsie was innocent. I could endure your wickedness if only I knew Elsie didn't share it!'

Hugh leaped from his chair with his hands clasped. 'Believe what you will about me,' he cried. 'I deserve it all. I deserve everything. But not of her—not of her, I beg of you. Believe no ill of poor dead Elsie!'

Winifred smiled a coldly satirical smile. 'So much devotion does you honour indeed,' she said in a scathing voice. 'Your consideration for dead Elsie's reputation is truly touching.—I only see one flaw in the case. If Elsie's dead, how did Mr Relf come to tell me, I should like to know, she was living at San Remo?'

'Relf!' Hugh cried, taken aback once more. 'Relf! Always! That serpent! That wriggling, insinuating, back-stairs intriguer! I hate the wretch. If I had him here now, I'd wring his neck for him with the greatest pleasure.—He's at the bottom of everything that turns up against me. He told you a lie, that's the plain explanation, and he told it to baffle me. He hates me, the cur, and he wanted to make my game harder. He knew it would sow distrust between you and me if he told you that lie; and he had no pity, like an unmanly sneak that he is, even on a poor weak helpless woman.'

'I see,' Winifred murmured with exasperating calmness. 'He told me the truth. It's his habit to tell it. And the truth happens to be very disconcerting to you, by making what you're frank enough to describe as your game a little harder. The word's sufficient. You can never do anything but play a game. That's very clear. I understand now. I prefer Mr Relf's assurance to yours, thank you!'

'Winifred,' Hugh cried, in an agony of despair, 'let me tell you the whole story again, bit by bit, act by act, scene by scene'—Winifred smiled derisively at the theatrical phrase—and you may question me out on every part of it. Cross-

examine me, please, like a hostile lawyer, to the minutest detail.—O Winnie, I want you to know the truth now. I wish you'd believe me. I can't endure to think that you should die mistaking me.'

His imploring look and his evident earnestness shook Winifred's wavering mind again. Even the worst of men has his truthful moments. Her resolution faltered. She began, as he suggested, cross-questioning him at full. He gave his replies plainly and straightforwardly. The fever of confession had seized hold of him once more. The pent-up secret had burst its bounds. He revealed his inmost soul to Winifred—he even admitted, with shame and agony, his abiding love and remorse for Elsie.

Overcome by her feelings, Winifred leaned back on the sofa and cried. Thank heaven, thank heaven, she could cry now. He was glad of that. She could cry, after all. That poor little cramped and cabined nature, turned in upon itself so long for lack of an outlet, found vent at last. Hugh cried himself, and held her hand. In her momentary impulse of womanly softening, she allowed him to hold it. Her wan small face pleaded piteously with his heart. 'Dare I, Winnie?' he asked with a faint tremor, and leaning forward, he kissed her forehead. She did not withdraw it. He thrilled at the concession. Then he thought with a pang how cruelly he had worn her young life out. She never reproached him; her feelings went far too deep for reproach. But she cried—silently.

At length she spoke. 'When I'm gone,' she said in a fainter voice now, 'you must put up a stone by Elsie's grave. I'm glad Elsie at least was true to me!'

Hugh's heart gave a bound. Then she wavered at last! She accepted his account! She knew that Elsie was dead and buried! He had carried his point. She believed him!—she believed him!

Winifred rose, and staggered feebly to her feet. 'I shall go to bed now,' she said in husky accents. 'You may send for a doctor. I shan't last long. But on the whole, I feel better so. I wanted Elsie to be alive indeed, because I hunger and thirst for sympathy, and Elsie would give it me. But I'm glad at least Elsie didn't deceive me!' She paused for a moment and wiped her eyes; then she steadied herself by the bar of the window—the air blew in so warm and fresh. She looked out at the palms and the blue, blue sea. It seemed to calm her, the beautiful south. She gazed long and wearily at the glassy water. But her dream didn't last undisturbed for many minutes. Of a sudden, a shade came over her face. Something below seemed to sting and appal her. She started back, tottering, from the open window. 'Hugh, Hugh!' she cried, ghastly pale and quivering, 'you said she was dead!—you said she was dead! You lie to me still. O heaven, how terrible!'

'So she is,' Hugh groaned out, half catching her in his arms for fear she should fall. 'Dead and buried, on my honour, at Orfordness, Winifred!'

'Hugh, Hugh! can you *never* tell me the truth?' And she stretched out one thin white bony forefinger towards the street beyond. One second she gasped a terrible gasp; then she flung

out the words with a last wild effort: 'That's she!—that's Elsie!'

CHAPTER XXXVIII.—GHOST OR WOMAN?

Winifred spoke with such concentrated force of inner conviction that, absurd and incredible as he knew it to be—for had he not seen Elsie's own grave that day at Orfordness?—Hugh rushed over to the window in a fever of sudden suspense and anxiety, and gazed across the street to the exact spot where Winifred's ghost-like finger pointed eagerly to some person or thing on the pavement opposite. He was almost too late, however, to prove her wrong. As he neared the window, he caught but a glimpse of a graceful figure in light half-mourning—like Elsie's, to be sure, in general outline, though distinctly a trifle older and fuller—disappearing in haste round the corner by the pharmacy.

The figure gave him none the less a shock of surprise. It was certainly a very strange and awkward coincidence. He glanced at Winifred. She stood triumphant there—triumphant but heart-broken—exulting over his defeat with one dying 'I told you so,' and chuckling out inarticulately in her thin small voice, with womanish persistence: 'That's she!—that's Elsie!'

'It's very like her!' he moaned in his agony.

'Very like her!' Winifred cried with a fresh burst of unnatural strength. 'Very like her!—O Hugh, I despise you! I tell you I saw her face to face! It's Elsie—it's Elsie!'

His brain reeled and whirled with the unexpected shock; the universe turned round on him as on a pivot. 'Winifred,' he cried, 'you're right! you're right! There can't be anybody else on earth so like her! I don't know how she's come back to life! She's dead and buried at Orfordness! It's a miracle! a miracle! But that's she that we saw! I can't deny it. That's she!—that's Elsie!'

His hat lay thrown down on the table by his side. He snatched it up in his eager haste to follow and track down this mysterious resemblance. He couldn't let Elsie's double, her bodily simulacrum, walk down the street unnoticed and unquestioned. A profound horror possessed his soul. A doubter by nature, he seemed to feel the solid earth failing beneath his feet. He had never before in all his life drawn so perilously close to the very verge and margin of the unseen universe. It was Elsie herself, or else—the grave had yielded up its shadowy occupant.

He rushed to the door, on fire with his sense of mystery and astonishment. A loud laugh by his side held him back as he went. He turned round. It was Winifred, laughing, choking, exultant, hysterical. She had flung herself down on the sofa now, and was catching her breath in spasmodic bursts with unnatural merriment. That was the awful kind of laughter that bodes no good to those who laugh it—hollow, horrible, mocking, delusive. Hugh saw at a glance she was dangerously ill. Her mirth was the mirth of mania, and worse. With a burning soul and a chafing heart, he turned back, as in duty bound, to her side again. He must leave Elsie's wraith to walk by itself, unexplained and uninvestigated, its ghostly way down the streets of San Remo.

He had more than enough to do at home. Winifred was dying!—dying of laughter.

And yet her laugh seemed almost hilarious. In spite of all, it had a ghastly ring of victory and boisterous joy in it. 'O Hugh,' she cried, with little choking chuckles, in the brief intervals of her spasmodic peals, 'you're *too* absurd! You'll kill me! you'll kill me!—I can't help laughing; it's *so* ridiculous.—You tell me one minute, with solemn oaths and ingenious lies, you've seen her grave—you know she's dead and buried: you pull long faces till you almost force me to believe you—you positively cry and moan and groan over her—and then the next second, when she passes the window before my very eyes, alive and well, and in her right mind, you seize your hat, you want to rush out and find her and embrace her—here, this moment, right under my face—and leave me alone to die by myself, without one soul on earth to wait upon me or help me! Oh, you make me laugh! You've broken my heart; but you'll be the death of me.—Puck and Don Juan rolled into one!—"Elsie's dead!—Why, there's dear Elsie!"—It's too incongruous; it's too ridiculous.' And she exploded once more in a hideous semblance of laughter.

Hugh gazed at her blankly, sobered with alarm. Was she going mad? or was he mad himself?—that he should see visions, and meet dead Elsie! Could it really be Elsie? He had heard strange stories of appearances and second-sight, such as mystics among us love to dwell upon; and in all of them the appearances were closely connected with death-bed scenes. Could any truth lurk, after all, in those discredited tales of wraiths and visions? Could Elsie's ghost have come from the grave to prepare him betimes for Winifred's funeral? Or did Winifred's dying mind, by some strange alchemy, project, as it were, an image of Elsie, who filled her soul, on to his own eye and brain, as he sat there beside her?

He brushed away these metaphysical cobwebs with a dash of his hand. Fool that he was to be led away thus by a mere accidental coincidence or resemblance! He was tired with sleeplessness; emotion had unmanned him.

Winifred's laugh dissolved itself into tears. She broke down now, hysterically, utterly. She sobbed and moaned in agony on the sofa. Deep sighs and loud laughter alternated horribly in her storm of emotion. The worst had come. She was dangerously ill. Hugh feared in his heart she was on the point of dying.

'Go!' she burst out, in one spasmodic effort, thrusting him away from her side with the palm of her open hand. 'I don't want you here. Go—go—to Elsie! I can die now. I've found you all out. You're both of you alike; you've both of you deceived me.'

Hugh rang the bell wildly for the Swiss waiter. 'Send the chambermaid!' he cried in his broken Italian. 'The patroness! A lady! The signora is ill. No time to be lost. I must run at once and find the English doctor.'

When Winifred looked around her again, she found two or three strange faces crowded beside the bed on which they had laid her, and a fresh young Italian girl, the landlady's daughter, holding her head and bathing her brows with that universal specific, orange-flower water. The faint

perfume revived her a little. The landlady's daughter was a comely girl, with sympathetic eyes, and she smiled the winsome Italian smile as the poor pale child opened her lids and looked vaguely up at her. 'Don't cry, signorina,' she said soothingly. Then her glance fell, woman-like, upon the plain gold ring on Winifred's thin and wasted fourth finger, and she corrected herself half unconsciously: 'Don't cry, signora. Your husband will soon be back by your side: he's gone to fetch the English doctor.'

'I don't want him,' Winifred cried, with intense yearning, in her boarding-school French, for she knew barely enough Italian to understand her new little friend. 'I don't want my husband; I want Elsie. Keep him away from me—keep him away, I pray.—Hold my hand yourself, and send away my husband! Je ne l'aime pas, cet homme-là!' And she burst once more into a discordant peal of hysterical laughter.

'The poor signora!' the girl murmured, with wide open eyes, to the others around. 'Her husband is cruel. Ah, wicked wretch! Hear what she says! She says she doesn't want any more to see him. She wants her sister!'

As she spoke, a white face appeared suddenly at the door—a bearded man's face, silent and sympathetic. Warren Relf had heard the commotion down-stairs, from his room above, and had seen Massinger rush in hot haste for the doctor. He had come down now with eager inquiry for poor wasted Winifred, whose face and figure had impressed him much as he saw her borne out by the porters at the railway station.

'Is the signora very ill?' he asked in a low voice of the nearest woman. 'She speaks no Italian, I fear. Can I be of any use to her?'

'Ecco! 'tis Signor Relf, the English artist!' the woman cried, in surprise; for all San Remo knew Warren well as an old inhabitant.—'Come in, signor,' she continued, with Italian frankness—for bedrooms in Italy are less sacred than in England. 'You know the signora? She is ill—very ill: she is faint—she is dying.'

At the name, Winifred turned her eyes languidly to the door, and raised herself, still dressed in her travelling dress, on her elbows on the bed. She yearned for sympathy. If only she could fling herself on Elsie's shoulder! Elsie, who had wronged her, would at least pity her. 'Mr Relf,' she cried, too weak to be surprised, but glad to welcome a fellow-countryman and acquaintance among so many strangers—and with Hugh himself worse than a stranger—'I'm going to die. But I want to speak to you. You know the truth. Tell me about Elsie. Why did Elsie Challoner deceive me?'

'Deceive you!' Warren answered, drawing nearer in his horror. 'She didn't deceive you. She couldn't deceive you. She only wished to spare your heart from suffering all her own heart had suffered. Elsie could never deceive any one!'

'But why did she write to say she was in Australia, when she was really living here in San Remo?' Winifred asked piteously. 'And why did she keep up a correspondence with my husband?'

'Write she was in Australia! She never wrote,' Warren cried in haste, seizing the poor dying girl's thin hand in his.—'Mrs Massinger,

this is no time to conceal anything. I dare not speak to you against your husband, but still'—

'I hate him!' Winifred gasped out, with concentrated loathing. 'He has done nothing since I knew him but lie to me and deceive me. Don't mind speaking ill of him; I don't object to that. What kills me is that Elsie has helped him! Elsie has helped him!'

'Elsie has not,' Warren answered, lifting up her white little hand to his lips and kissing it respectfully. 'Elsie and I are very close friends. Elsie has always loved you dearly. If she's hidden anything from you, she hid it for your own sake alone.—It was Hugh Massinger who forged those letters.—I can't let you die thinking ill of Elsie. Elsie has never, never written to him.—I know it all.—I'll tell you the truth. Your husband thought she was drowned at Whitestrand!'

'Then Hugh doesn't know she's living here?' Winifred cried eagerly.

Warren Relf hardly knew how to answer her in this unexpected crisis. It was a terrible moment. He couldn't expose Elsie to the chance of meeting Hugh face to face. The shock and strain, he knew, would be hard for her to bear. But, on the other hand, he couldn't let that poor broken-hearted little woman die with this fearful load of misery unlightened on her bosom. The truth was best. The truth is always safest. 'Hugh doesn't know she's living here,' he answered slowly. 'But if I could only be sure that Hugh and she would not meet, I'd bring her round, before she leaves San Remo, this very day, and let you hear from her own lips, beyond dispute, her true story.'

Winifred clenched her thin hands hard and tight. 'He shall never enter this room again,' she whispered hoarsely, 'till he enters it to see me laid out for burial.'

COURTS-MARTIAL.

THE public mind was some months ago seriously disquieted by a court-martial held at Brompton Barracks, Chatham, on Major Templer, of the King's Own Royal Rifles. That officer was charged with the serious offence of betraying certain State secrets with regard to ballooning and balloon-making, and with telling lies to his superior officers. The Major was not only fully and honourably acquitted, but has returned to his duty; he has also received the approval of all sections of the press, and the practical sympathy of the Government, who have paid all the expenses—about six hundred pounds—which he necessarily incurred in his defence. The Secretary of State for War has not only personally apologised to the gallant officer, but also from his place in the House of Commons. So large a section of the public have taken a deep interest in the above case, that probably many readers will be glad to learn something of the constitution and powers of courts-martial.

For the benefit of the uninitiated, it may be mentioned that neither officers nor soldiers lose their rights as civilians by being in the army; but they are bound also by the sterner codes of the Mutiny Act, Articles of War, and Army Judicature Act. The decisions or findings on all the cases to which we presently refer having been

officially promulgated, none are of a debatable nature.

Courts-martial have probably derived their name and much of their jurisdiction from the Marshal's Court or court-martial of our ancient organisation. Their modern form—ensuring the benefits of trial by jury—was established in the reign of Charles I. A strong resemblance to the 'Articles and Military Laws' of Gustavus Adolphus and the military jurisprudence of Germany and the Low Countries, is apparent in our courts-martial system of the present day. The ordinary jurisdiction of courts-martial extends to taking cognisance of offences committed either at home or abroad, by land or sea, by those who are subject to the Army or Mutiny Act. The courts not only have the powers of a court of general assize, but are essentially courts of equity and honour; and no appeal lies from the sentence of a court-martial either to the Court of Queen's Bench or to any other court in the British dominions. This apparently remarkable anomaly is accounted for by the fact that the Judge Advocate-General personally submits to the sovereign, for approval, the proceedings of general courts-martial, and therefore it would be unconstitutional for a court of law to revise or review the personal approval of the queen or king.

Courts-martial are of five denominations: (1) General, (2) Detachment General, (3) District (or Garrison), (4) Detachment (or Regimental), and (5) Drum Head; and the number of commissioned officers required to form them varies from three to eleven, according to their denomination, and according to the part of the world in which they may be assembled. Their internal working is remarkable, and instructive, when compared with that of ordinary courts of law, and may be illustrated by reference to cases which have taken place since 1862, when much regimental dirty linen was washed before the public. In that year, the non-military world had its newspapers filled with a scandal to which a distinguished regiment, then in Dublin, treated the public. A Captain of that regiment was tried upon the following charges: 'For not having submitted the matter of Colonel —'s insult to be dealt with by superior authority, in compliance with the 17th Article of War; for not having taken proper lawful steps to vindicate his character; and also for having, in his final letter, stated that he had submitted his application to retire from the army "entirely through intimidation," knowing the statement to be false.'

The court-martial was held in barracks in Dublin, in a room once a schoolroom, which still retained its wall ornaments of maps and diagrams. Near the entrance door was a general miscellaneous collection of Irish jaunting-cars and seedy cabs, plenty of idlers, a few officers, and many orderlies and other soldiers on duty. Inside the room, the officers comprising the court, arrayed in scarlet (or blue), edged with gold, *not* ermine, sat at a long table covered with green baize. When a witness was called, there being no witness-box, he usually took up his own position. The Captain—whose trial, by the way, took twenty-nine days—had comfortably ensconced himself in a corner behind a neat table, and added materially to his own comfort, and, as events proved, 'confounded the knavish tricks' of his enemies

by 'taking to himself' two or three gentlemen in neat black dress, who sat near him. These were his solicitors and counsel; but, according to military rule of 1862, the judges in scarlet had to be 'colour-blind' regarding these personages, who were assumed to convey their professional assistance in a surreptitious and mysterious manner. After the court had been sworn 'to duly administer justice according to the rules and articles for the better government of Her Majesty's forces, and according to an Act then in force for the punishment of Mutiny and Desertion and other crimes therein specified, without partiality, favour, or affection,' &c., the witnesses were duly called, and then the court became a 'spectacle,' in its happy mimicry of a genuine trial, by the strangeness of the procedure, the length and sluggishness of this *cause célèbre*. The court-martial system with its measured pace and grave tediousness, however, put to shame the indecent haste in which, inside the genuine temples of law, cases are sometimes unduly rushed or scampered through, regardless of their merits; but the scarlet judge and jury who sat at the table in happy equality, no doubt felt themselves to be trustees of the court-martial system, and having apparently no fixed idea as to what evidence was to be excluded or admitted, administered justice with all proper scrupulousness and deliberation. When the prisoner, the Captain, wished to put a question, either he or one of his legal advisers wrote it on a slip of paper, handed it to an orderly, who took it to the President (or supreme judge of the court), who first read it to himself. If he thought there was anything wrong in the question, he probably had a friendly colloquy with the prisoner and suggested an alteration; but if the Captain was obstinate, the 'docket' went on to the Judge Advocate-General, and after antagonistic trimming or shaping, the question was either put, or the court cleared that the judges might sit with closed doors to deliberate on it. In the latter event, the professional amateur brethren who had crowded in from the four courts of Dublin, the prisoner and his advisers, newspaper reporters, and all the tag-rag and bobtail, were hastily hunted out, and the door of the court shut while the members held counsel. In about a quarter of an hour the door was opened, and in scampered, with much rushing and stamping, the excluded heterogeneous human mass. Order and silence having been restored, the military chief-justice reads in a sonorous impressive voice the decision of the court on the question. The decision was that it might be put, and it ran as follows:

Question. Did Colonel Touchemsup state to you, in the presence of Cornet Snaffle, that the prisoner rode improperly, and needed a back-board?

Heavy Dragoon Captain, witness, deliberately replied: 'I do not remember positively.'

After the answer had been written down, the (acting) Judge Advocate-General read it out in measured terms. The slip of paper on which the question had been written was now impaled on a 'bill-file,' and the transaction ended, only to be recommenced in similar fashion.

Question by the Prisoner. Do you consider the Colonel persecuted me?

After this question had travelled safely through the stages we have enumerated, the Heavy

Dragoon Captain replied: 'I respectfully object to answer.'

A member of the court who was making a surreptitious and caricature sketch, stopped short with astonishment, and the court, through its President, gently pressed Heavy Dragoon Captain to reply. The Heavy Dragoon Captain positively refused, and as before, the court was, to the disgust of its occupiers, again cleared. After an interval of twenty minutes, the debate with closed doors is over, and the public are readmitted.

Result.—The court decide that the Heavy Dragoon Captain must answer.

The Deputy Judge Advocate-General reads the question aloud. The Heavy Dragoon Captain, after looking at the ceiling, the map on the wall, the prisoner, and the court, replies in measured voice: 'I do not know.'

The pens once more took up the burden, and so this punctilious method went on. This is no over-drawn sketch; it had been the system of court-martial procedure for over a hundred years; indeed, it is only within the last four or five years that the system has been altered, and assimilated to the practice of ordinary law-courts. A witty writer of 1862 thus analyses the manner in which the different days of this court-martial were occupied, and there is really no over-colouring:

	Days.
Case for the prosecution.....	7
Defence and evidence for the prisoner.....	7½
Inquiry whether or not Colonel — tampered with a witness.....	1½
Witness to contradict the defence.....	5
Witness to contradict the witnesses who contradicted the defence.....	2
Witness to contradict the witnesses who contradicted the witnesses who contradicted the defence.....	2
Witness to contradict the last-mentioned witness.....	1
Concluding speech of Captain —, who had spoken twice before.....	1
Concluding speech of the prosecutor.....	1
Fragments of days.....	1

29

Of course, if the trial had been before a judge, the greater part of the evidence and the contradictions of the witnesses, like the House that Jack built, would have been rejected as irrelevant to the question at issue; in point of fact, this regimental squabble really occupied as much time as all the four trials of Palmer, Madeleine Smith, Smeethurst, and Rush. In these trials of intense intricacy and importance, where the parties were tried for their lives, the judges satisfactorily got over all the cases within the period this one court-martial occupied. The end of the above long trial was that the Captain in question was acquitted of the first and third charges, found guilty of the second, and sentenced to be turned out of the service. He had, however, as previously explained, artfully provided himself with those skillful weapons, a good solicitor and advocate; and as a final result, the court-martial was not confirmed, on the ground of some legal irregularity, and the officer thus became an acquitted man.

A few years after, the public were treated to two more decidedly scandalous courts-martial, and accusations enough were freely exchanged to render the small and select society to which the

accused belonged the reverse of comfortable. One of the officers involved, a Captain, was A.D.C. to the Commander-in-chief in India, and had the reputation of being a zealous and good officer; but differences between him and his chief arose somehow, and the result was a court-martial which was a public scandal all over India and England, both from the time it occupied and the nature of the evidence. The War Office authorities took up the case, and a correspondence took place between them and the Indian authorities, in which both parties indulged in the pastime of pelting each other with adjectives.

With regard to the other officer, a Colonel, the accusations were so framed, and the feeling in India so strong against him, that the venue was changed from India to England, so that the Colonel and his accusers and a multitude of witnesses were brought at the public expense from India to England, where the trial took place. At that court-martial, more regard was had as to conditions of space for the public and the reporters, and the newspapers had, as the Americans say, 'a high good time' in reporting the case for many days. The public also were gratified by all sorts of imputations of conspiracy and malice, with so much hunting after regimental squabbles, foreign to the issue, that the original charge against the Colonel seemed to fade into insignificance. The court-martial lasted a good many weeks, and the Colonel was acquitted. The battle, however, was an expensive one, and the public had to pay about fifty thousand pounds for the pastime. Since that court-martial, however, the War Office have not indulged in a similar financial exploit of bringing accused, accuser, and all the witnesses from a distant land to England for the purpose of holding the trial.

In 1876, when there had been, as it were, a Rip-van-Winkle interval of eight or ten years, the War Office woke up from its slumbers, and indulged the public with a court-martial on one of the officers of a marching regiment. That gentleman was tried at Belfast on charges which it is unnecessary to specify. It was considered to be a remarkable fact at the time, that many people who gave evidence before the court and flatly contradicted each other were supposed to be models of honour and veracity. This trial only lasted twelve days, but an enormous amount of mud was thrown, and the 'scarlet inquisition' had no easy task in hunting down the right parties. The same system as to writing down questions on slips of paper was pursued; the defence was printed and read aloud in court, which was anything but a 'harbour of repose,' from the number of objections made to the line adopted by the prosecution, and also other points raised by the solicitor for the prisoner. Finally, the officer was acquitted of the whole of the first charge; but he was convicted of a portion of the second charge; and a few days after, the *Irish Times* astonished the public by publishing the sentence of the court, and hinting at the votes of the members, apparently by a very narrow majority, adverse to the prisoner.

As an oath is taken by all the members neither to divulge the sentence until the court-martial has been confirmed, nor 'on any account at any time whatsoever to disclose or discover' the vote or opinion of any particular member of the court,

this incident excited much comment and inquiry; but the press as usual kept its own counsel, and nothing was proved against any one. The officer had to leave the army; but Her Majesty was graciously pleased to order the price of his commission to be paid him.

In the Templer court-martial recently held at Chatham, the prosecutor and the prisoner were permitted to be represented in the ordinary way by counsels and solicitors. The Major took full advantage of his powers, and provided himself with an astute solicitor, and a very clever cross-examining counsel, Mr Winch, Q.C. The latter gentleman considerably edified the court, the witnesses, and the public, by the free use of his sharp scalping-knife of cross-examination, which he applied somewhat ruthlessly all round to the hostile witnesses, springing a mine from time to time on the Treasury Advocate who prosecuted. It is a step in the right direction that the advocate of a prisoner may, like the French advocate who addresses a *conseil de guerre* when a French prisoner is tried, address a court-martial.

In accordance with rule, the court was closed after the defence had ended, and the President asked each officer to vote 'guilty or not guilty' according to his conscience and his oath, beginning with the junior member of the court. As the Major was acquitted, he was at once released. Had he been found guilty, the proceedings of the court-martial, after being examined in the office of the Judge Advocate-General, would have been laid before the Queen for final approval or disapproval. As a proof of the value of the 'new system,' we may mention that this court-martial occupied only four days. Probably, had it come before a judge, he would have stopped the case in a few hours.

MRS FARQUHARSON'S NIECE.

By WILLIAM GALBRAITH.

IN FOUR CHAPTERS.

CHAP. I.—AN UNEXPECTED ARRIVAL.

WHEN I first left home to act as companion to Mrs Farquharson at Shuttleton Manor, I was only eighteen, and very simple and inexperienced; but, unlike many who long to try their wings outside the home circle, my first flight into the great world beyond tended nothing to diminish the bright visions in which young hearts are prone to indulge, for, in Mrs Farquharson's house, I was from the beginning treated more like a daughter than a hired companion; and though I missed the home faces very much, yet I was seldom subject to those fits of loneliness and depression which are the general experience of those launched out on the busy world for the first time and separated from all family ties.

Mrs Farquharson was a widow, with no children; two she had had, but both died in infancy out in India, where her husband had held a post under government. She had been but two years in England when I first went to her, having come home after her husband's death. Possessed of ample means—for she had a private fortune of her own, inherited from an aunt, besides what her

husband left—she yet lived in a very quiet style, keeping but four servants and seeing little company; indeed, but for an occasional visit from the rector or his wife, and a chance one from the curate, we would have seen almost nobody save ourselves. The house was large, commodious, and old-fashioned, and had been known as the Manor for ages back. It had been for some time untenanted before Mrs Farquharson entered into possession, the owner being unmarried and resident abroad. It was a larger house than Mrs Farquharson at first contemplated renting; but the rent was very moderate, and she conceived a liking for it when first she saw it, which finally led to her leasing it for a period of five years. A good many of the rooms were unfurnished, because not required. I may add here that, beyond its antiquity, there was nothing romantic about the house—no thrilling, blood-curdling stories of restless ghosts roaming the gloomy corridors aimlessly through the silent watches of the night, or of haunted chambers and dark deeds committed in days gone by, but, on the contrary, everything was very prosaic and matter of fact, as befitted the nineteenth century. The Manor stood about a quarter of a mile off the main road which led to the village of Shuttleton, and was approached by a long avenue of beeches. The grounds around it were pretty extensive, though much less so than in days long since past.

My duties as companion were very light. Sometimes I read to Mrs Farquharson while she sewed; wrote letters to her dictation, or occupied myself with some fancy-work while we both sat and chatted. At other times we drove out occasionally, hiring from the village inn for this purpose—Mrs Farquharson keeping neither horse nor carriage—or strolled about the grounds together, she being still strong and active for her years. My lines had certainly fallen in pleasant places; and although many of my age would have considered the life we led somewhat dull, yet I never found it so, as at home I had been used to a very quiet humdrum life and had small inclination for gaiety of any kind. I had always been of a quiet disposition—too much so for my years, my dear mother often said. We had recently had a new member added to our household at the Manor in the shape of an old bachelor brother of Mrs Farquharson's—Mr Vaughan, a Professor of Theology from one of the universities, who, through failing health, had felt himself obliged to resign his professorship, and, at his sister's request, had been prevailed on to give up his own bachelor establishment and come and live with her. His presence made little difference in our mode of living, however, as he buried himself in his books from morning till night, and spent most of his time in his own room, generally having his meals sent up to him, so that sometimes for days together I scarcely saw him. He was engaged writing a work on theology, which took up a great portion of his time. He never joined us in our walks or drives, and seldom left the house except when he went up to town for a day to purchase some new book or visit some old acquaintance.

One bright sunny afternoon in June, about six months after my arrival at the Manor, I started for the village, a book under my arm, borrowed from the village library, which Mrs Farquharson and I had been reading together, and which I

intended to return. Here in the darkened avenue the sun's strong heat did not penetrate, and my white sunshade hung carelessly in my hand as I walked along. When I came within view of the east gate, I caught sight of a figure approaching, evidently making for the house. It was that of a woman, dressed entirely from head to foot in gray, and carrying a cloak of the same Quaker-like hue over her arm. In her hand she carried a small travelling bag. She was advancing along the avenue at a swinging pace, and flourishing the bag backwards and forwards in her hand, as though its weight were nothing. On first observing me, she seemed somewhat taken aback; her swinging pace dwindled down into a graceful walk, and her hand with the bag dropped to her side very demurely, and remained stationary. As she came nearer, I saw that she was of fair complexion, had on a short veil, and wore her hair cut short behind and in a fringe over her brow. She was remarkably tall, I thought, for a woman, but carried her figure gracefully. When she stopped beside me, I felt like a pigmy beside a giantess.

'I beg your pardon,' said she, in a soft deep musical voice, 'but am I right in thinking this avenue leads to the Manor—to Mrs Farquharson's?'

'You are perfectly right,' I answered. 'This leads you direct to the Hall entrance. You cannot go wrong.'

She thanked me, and walked on, not without an admiring glance at my soft white dress and light straw hat. For my life I could not help turning to look after her. Perhaps she suspected this, for she never turned her head or resumed her swinging walk, although I watched her till she went out of sight round a turn of the avenue. 'Who can she be?' I wondered. 'Certainly, not a visitor to the servants; and yet Mrs Farquharson was expecting no one, and this girl seems as though she had come to stay.'

When I got back to the house it was nearly six o'clock. The door was opened by Mrs Glass the housekeeper, with whom I was a great favourite. I saw instantly by her face that she had something to tell me. She followed me up-stairs to my room. 'Mrs Farquharson has a visitor this afternoon, miss,' she began, shutting the door behind her carefully, 'a niece of hers—a Miss Selwyn. She has come to stay for a day or two. We are having tea at half-past six.'

'Is she a tall young lady dressed in gray?' I inquired, much interested. 'For if so, I met her in the avenue, coming here.'

'Yes, miss, that is her,' replied Mrs Glass, 'tall and fair.—I don't think Mrs Farquharson expected her, for she appeared much surprised when she arrived.'

'I suppose I had better not go down till Mrs Farquharson sends for me, then,' I said. 'She will have a lot of things to say to her niece, probably, that she may not wish a stranger to hear. I wonder she did not mention her coming to me, if she knew.'

'I don't think she did, miss; but I will have to go down and see after things. I don't want Mrs Farquharson to catch me gossiping.'

After she left me, I stood gazing abstractedly out of the window into the garden beyond, my thoughts full of the unexpected visitor. I hoped

if she were going to stay for any length of time, she would prove nice and agreeable; for, if not, I might be made very uncomfortable in my position of companion. Mrs Farquharson had a sister down in one of the southern counties, I knew, whose married name was Selwyn; but of the existence of a Miss Selwyn I had never previously heard. My impression, indeed, had been that she had none of a family; but evidently I was mistaken. There had also been another sister married, who had died many years ago, leaving a son, who was in business somewhere in London. I had never seen Mrs Selwyn at the Manor.

I washed my face and hands, changed my dress for one of black grenadine—a present from Mrs Farquharson—placed a few flowers in my hair and dress, and then my toilet was complete. Mrs Farquharson and I always dined together, as a matter of course; but to-night I hesitated about going down till sent for. I felt my position slightly altered by the arrival of Miss Selwyn. About half-past six, however, a message was brought me by one of the maids that Mrs Farquharson wished me to go down-stairs to join her and Miss Selwyn at tea. Somewhat fluttered, I descended the broad stairway leading to the hall. I found Mrs Farquharson and her niece in her favourite sitting-room, at the back of the large drawing-room, where we generally dined when alone. Our dinner-hour was three o'clock, and tea at six. We kept somewhat primitive hours.

As I entered the room, Miss Selwyn was standing admiring herself in a large mirror which stood over the mantel-piece. She still wore her gray dress, and looked even taller without her hat. She came forward with a smile.

'Doris, my friend Miss Stuart.—Naomi, this is my niece, Doris Selwyn. I daresay you have heard me speak of her.' Mrs Farquharson seemed to perform this introduction with an effort. As a matter of fact, I had never previously heard Miss Selwyn mentioned; but I let that pass.

'Miss Stuart and I have already met, aunt,' Miss Selwyn said frankly, holding out her hand and dropping a light kiss on my cheek. As she did so, I happened to glance towards Mrs Farquharson, and was astonished at the expression of something almost like fear which her countenance betrayed; but it was but momentary; an instant later, I concluded I was mistaken.

'I hope we shall be great friends,' continued Miss Selwyn. 'I always know at first whether I shall like a person or not, and I think I shall like you.—And so your name is Naomi! It is very quaint and pretty, I think, and just suits you.'

'Not so pretty as your own,' said I. 'Mine is rather old-maidish and sedate; while yours'—

'Puts you in mind of a giddy romp, as I am,' interrupted she in a gay tone.—'Are you not surprised at seeing me, Miss Stuart? The fact is, I was returning home from a visit to some friends in Scotland, and passing by this place, thought I would look aunt and uncle up on the way.—Uncle has not yet put in an appearance, though.—You will have to excuse my dress, for all the rest of my luggage has been sent on, and I have only this with me, and one for the mornings; but I knew aunt lived very quietly, so I daresay it will not matter.'

'I am sure, Doris, both Naomi and I are very

pleased to see you,' said Mrs Farquharson, rather more cordially, I thought; 'only, perhaps you will find it dull.—As for the dress, if necessary that can easily be remedied; but probably you will not need, as you are sure to tire of our quiet life.—But here comes tea at last.'

During the meal, which Professor Vaughan did not honour with his presence, Miss Selwyn talked incessantly, rattling on at such a rate and using so many slang terms that I was rather amazed, but nevertheless enjoyed her conversation very much. Mrs Farquharson, too, appeared to unbend towards her niece. At first, by her manner, I had judged the visitor to be unwelcome, but attributed this to Mrs Farquharson's dislike to anything which disturbed our retired way of living. I must say that Miss Selwyn was blest with an extraordinarily good appetite, for I did think she never would have finished; while Mrs Farquharson and I merely dawdled over our meal to keep her in countenance.

'I was dreadfully famishing, aunt,' she said at length, pushing back her cup. 'I should so like to have a stroll about the grounds'—rising and walking towards the long window which opened outwards into the garden.—'If you do not care for coming, perhaps Miss Stuart will accompany me, or I can go alone.'

A little to my surprise, for she never went out after sunset, Mrs Farquharson rose at once, wrapping round her a white shawl, which hung over the back of her chair.—Miss Selwyn had snatched up an antimacassar from the couch, and gracefully flung it over her shoulders.—'I will go with you, Doris,' Mrs Farquharson said; 'Naomi will be tired after her walk.'

I was about to disclaim all feeling of weariness; but without waiting, Miss Selwyn swung open the window, and a minute later they were outside amongst the flowers. Seen from the window, there was a strong resemblance between them; both were tall, though Miss Selwyn had decidedly the advantage, and their features were very similar. Miss Selwyn's were if anything too large for a woman; and her closely cropped hair gave her a boyish appearance, which well suited the hoydenish character she affected. She might be somewhere about three or four and twenty, judging by her looks. She interested me greatly; her frank careless manner was very winning; she was such a complete contrast to myself in every way, for I was small and dark, and had little to say to any one until I was well acquainted. The habit she had of interlarding her conversation with slang terms gave a piquancy to it that seemed to render her smallest remarks brilliant and witty. She was undeniably handsome; while I had never considered myself a beauty at the best of times. I longed to join them, and for the first time felt as if Mrs Farquharson might consider me an intruder, since she had not asked me to accompany them.

Next morning I rose early as usual, for I liked a half-hour amongst the flowers before breakfast. I was busy arranging a small bouquet from my own particular plot for the breakfast table, when I heard footsteps approaching, and looking up, beheld Miss Selwyn, arrayed in a crimson morning gown, with Mrs Farquharson's white shawl round her shoulders, and on her head an old

garden hat of my own, which she had picked up in the hall.

'Good-morning,' she cried gaily. 'I saw you from the window, and thought it a pity to let you pine in solitude and alone. So here I am.'

'I wasn't pining; but I am glad to see you all the same.—Isn't it a lovely morning? I hope you slept well, Miss Selwyn?'

'Thanks. I slept better than I expected.—By the way, where did you disappear to last night? When aunt and I came in, you had gone off.—I hope you will not let my being here make any difference to you, Miss Stuart. I should like to call you Naomi, and you can call me Doris. May I?'

'Certainly, if you wish,' I stammered, colouring a little. 'You are very kind.—I had some letters to write last night, and took the opportunity of doing so when Mrs Farquharson would not be likely to miss me.'

'Oh, that is all right, then. I was afraid I had driven you away.—Uncle came down-stairs after aunt and I came in last night, and I had "quite a time" with him, as the Americans say.—What a comical old boy he is; he seems half asleep most of the time. I must try and rouse him up; see if I don't! I told him he must come down to breakfast this morning, as I wouldn't enjoy the meal without him; and if he doesn't turn up, I'll let him hear of it. He'll have to give up his beloved books for one morning at least.—Is this your own particular garden, Naomi? Aunt tells me you take chief charge of the flowers.'

'Yes; this is my own little plot,' I replied, twisting a long blade of grass round the stalks of my bouquet and then holding the flowers up to her for inspection. 'Did you ever see anything so pretty?'

'I think I have,' she answered smiling, glancing at me meaningly as she spoke. 'A great deal prettier, too. But they are very nice.—I should like that rose you have, it is so sweet.—Thank you, I shall keep it for your sake.—There is aunt looking from the window; perhaps we had better go in.' And in we went, my face flushing rosy red at the compliment her eyes had paid me. Had she been a man, I do not think I could have been more confused.

SMUGGLING IN THE HIGHLANDS.

SINCE the repeal of the Malt Tax in 1880, an increase of smuggling has gradually taken place in the Highlands, and this increase is beginning to assume formidable proportions, in spite of the utmost endeavours of the revenue authorities. About the middle of the present century smuggling was very common in the wild isolated parts of the country; but owing to the restrictions placed on the materials used in the manufacture of spirits, and the vigilance and zeal of the revenue officers, illicit distillation was practically suppressed; and although a few working bothies or huts still existed, the quantity of spirits made in them did not seriously affect the interests of the revenue.

The stations formed by the Board of Inland Revenue for the suppression of smuggling are of

two kinds, called Preventive Stations and Preventive Rides respectively. The former are established in parts where smuggling is known to be extensively practised, the staff consisting of an Inland Revenue officer and one or two 'Preventive men.' These have also the occasional assistance of a supervisor, who has generally four or five stations under his charge, each station being visited by him, on an average, once a week. The officer and his men always search in company; and as they are required to sleep away from home eight times per fortnight, a special allowance is made to them, to meet the expenses incurred for lodgings and subsistence. Preventive Rides are made in places where illicit distillation is not carried on, but where, owing to the smuggling inclinations of the people, and where the geographical formation of the country favours the unlawful making of spirits being carried on with some chances of secrecy, smuggling would be certain to commence if an official was not at hand to check it. One officer is considered sufficient for this; and in addition to the usual work of securing the license duties in his station, he has to endeavour to find out, by means of inquiries or searching, if any illicit practices are carried on in his neighbourhood.

It will thus be seen that the Preventive Station with its comparatively large staff is much more expensive than the Ride, and as smuggling was gradually suppressed, many of the stations were abolished for the sake of economy, and Rides established in their places.

Owing to the Malt Duty regulations, and the considerable time it takes to change barley into malt, and the consequent risk of being detected in its illicit manufacture, the decreased staff was able to prevent the revival of smuggling; but as soon as the Malt Duty was repealed, the smugglers seized the opportunity of recommencing operations, as they were quite aware of the reduced strength of the revenue establishments, it being impossible for a single officer to enter a bothy, seize the offenders, and destroy the utensils. It is only recently that the authorities recognised the gravity of the crisis that had arisen, and steps are being taken to re-establish some of the Preventive Stations, and deal with the smuggling in a determined manner.

The smuggler generally figures in novels and in the imagination as a highly interesting and romantic creature; but on a personal acquaintance, these ideas respecting him soon give place to others of an entirely different character. Instead of the generous and high-spirited individual one expects to meet, the smuggler is seen to be a very low type of a Highlander, much addicted to drinking, laziness, and lying, and bearing a great similarity in character to the poacher of the South. He generally pretends to follow some employment, such as a diker, fencer, stone-breaker, &c.; but it is on very rare occasions that he can be found engaged in his professed trade. He is generally to be seen lounging about

the village in a listless manner, as if he were one of the most innocent beings and quite incapable of breaking any law. At intervals he disappears from his haunts for five or six days; and when he returns, there is an unmistakable odour of 'peat-reek' (peat-smoke) about him; and the redness of his eyes at once gives evidence that he was a great deal among smoke during his absence. A few days' dissipation will follow, then a period of lounging, and he will again disappear for another short time.

As it is well known that whisky cannot be made without a plentiful supply of cold water, the smuggler usually selects for his operations a secluded spot in the side of a well-wooded burn with high banks. A square part is dug out till the bottom is nearly level with the water. The front is now built up with rough stones, a space being left for entry and exit. The bank forms the other three sides of the bothy, and the roof is made with crossed sticks covered with tarpaulin, the whole being concealed with brushwood and heather so cunningly adjusted and sloped that it requires the minutest scrutiny to ascertain that nature has not been disturbed. This building is necessary to protect the workers from the inclemency of the weather, and to conceal the light of the distilling fire from the watchful eyes of the revenue officials. The manufacture of whisky requires two distinct operations—namely, brewing and distilling. Brewing consists in placing ground malt in a vessel, pouring boiling water over it, and stirring the mixture till the strength of the malt is transferred to the water, which then receives the name of 'wort.' The wort is now removed from the grains and placed in another vessel, and to this yeast is added. Fermentation then takes place, which gradually reduces the specific gravity; and when it has attenuated, or reduced in gravity, to a certain point, it is ready for distilling. This process consists in separating the alcohol from the other ingredients of which the wort is composed; and for this purpose the liquor is placed in a vessel called a 'still,' which is of peculiar construction. It is made of copper, as a cheaper material will impart its taste to the spirits, is generally of a round shape, and of considerable capacity at the lower part, but gradually growing narrower towards the upper end, which has a closely fitting cover or head with a hole, into which a small pipe fits accurately, this pipe soon taking a downward course. Fire is now applied to the bottom of the still; and when the liquor is sufficiently heated, the alcohol having the property of assuming the form of vapour at a lower temperature than any of the other ingredients, escapes into the pipe at the top in the form of steam. This pipe is of considerable length, but of zigzag form, and is called the 'worm.' As it is necessary to condense the steam quickly, this is done by laying the worm in cold water, which accounts for its crooked shape, as it would be very inconvenient to cover a long straight pipe with a continuous stream of cold water. The condensed steam runs into a vessel from the end of the worm in the form of whisky; and when all the spirits are run off, the operation is finished. The time taken by the brewing and distilling processes is generally from five to six days. The 'peat-reek' odour of the smuggler and the redness of his eyes, which

were previously mentioned as being peculiar to him on his return home after the completion of his illegal work, are caused by working in the close smoke-laden atmosphere of the bothy. As the smoke is apt to draw attention to their labour, the peats are generally charred in their houses before being used in the bothy, as peats thus treated do not give off so much smoke during consumption as fresh ones.

The most valuable part of a smuggler's plant is the still and worm; and great precautions are used to prevent these from falling into the hands of the excise staff. A special hiding-place is prepared at a considerable distance from the bothy, this place generally being a deep pool of water or an artfully excavated hole. As they are only taken to the bothy when required for distillation, and removed to their hiding-place when the operation is finished, the only vessels that are destroyed or seized by the officials when a bothy is discovered—except the seizure be made during the distilling process—are the mashing and fermenting vessels, which, being made of wood, are of little value, and are easily replaced. Another point on which the ingenuity of the smuggler is exercised is to dispose of the 'draff,' or mashed malt, without being discovered. In places very difficult of access, it is sometimes allowed to remain near the scene of operations; but as there is always a danger of the accumulations being seen by prying eyes, it is safer when it can be completely destroyed. It is dangerous to put it into the burn, as some particles would be certain to lodge at the sides and thus betray the presence of smuggling; and the plan adopted, if at all possible, is to bring cattle to the vicinity and give them the grains to eat, thus destroying all traces through the presence of draff by which their secret place may be discovered.

The only way that smugglers can be captured in the midst of their labours is to make a raid on them by night, as watchers are placed during the day on commanding positions, and the alarm is at once given when enemies are seen in the neighbourhood. The position of a bothy must be pretty accurately known to the officers before they attempt to look for it at night, as it would be a hopeless task to commence a vague search among the hills and glens during the darkness; and they generally learn the whereabouts of the smuggling ground from informers, who give the information for the sake of a reward or from motives of revenge. The following instances of the capture of smuggling material came under the personal observation of the writer during an extended stay in the Highlands.

One day the officer of a Preventive Ride received notice that distilling was being carried on in a certain burn, and that the operation would be completed during the coming night. The burn was not in his own station, so he telegraphed to the proper officer and to his own supervisor to meet him that evening at a certain place. The supervisor duly appeared; but the other did not come, as he did not receive the telegram in time, being absent from home. As the district was not known to the two, and the informer was afraid to accompany them in case he should be recognised, they had not much hope of being able to find the place; but they resolved to do their best, as prompt action had to

be taken, or the opportunity would be lost. The night was very wet and cold; and after a drive of sixteen miles, they arrived at an hotel about four miles from the burn, where the horse was put up, and the officers set out to complete the rest of the journey on foot. They arrived at the lower end of the burn about one A.M., and immediately commenced their search. Their progress up the stream was very slow, owing to the darkness and the uneven nature of the ground, but they toiled on till six o'clock, when, to their chagrin, they reached the source of the rivulet without being successful. Day was then breaking, and they resolved to give up the search, and accordingly commenced their homeward journey.

After walking about three miles, still keeping near the stream, they saw some people moving about; and on going in their direction, a very nicely constructed bothy was discovered, with the fermenting vessels and mash tub inside and a fire burning. The spirits, the still, and the worm had, however, been removed during the night, and though an elaborate search was made, no trace of them could be found. The only consolation the officers had for their arduous night's toil was the demolition of the bothy and the wooden vessels. During this work of destruction, the smugglers crowded round them, as they knew they were safe, not having been found inside, and taunted the officers with their want of success, and told them that they had arrived too late. The mark of the smoky still was seen on the back of one who had evidently carried it to its hiding-place; but of course no evidence could be produced against him, though it was well known that he was the chief of the gang. The reason why the discovery was not made on the upward search was owing to the fact that the bothy was not built in the bed of the burn, but in a hollow that ran parallel to it, at a distance of nearly three hundred yards, water having been conveyed into the hollow from a higher point of the stream by means of a drain which had been cut by the smugglers. Three nights after this expedition, the officers returned to see if things were quiet, and observing a light in the chief smuggler's house, approached the window, and on looking in saw him coolly engaged making new tubs to replace those so recently destroyed.

About a month later, word was received that the same gang was again at work, but in a different place. A strong party was organised on this occasion, and a thorough search commenced during the night. As the precise spot was not accurately known, daylight again began to break before they met with any success; then the rumbling of a cart was heard, which on a close inspection was seen to be loaded with peat. As soon as the driver saw them, he took off his coat and commenced to wave it round his head, at the same time yelling at the top of his voice. The officers, aware that he was giving the alarm to some one, soon saw several men steal out of an old disused farm-steading, and rush at full speed towards the hills, over which they disappeared. Although chase was at once given, it was soon seen to be in vain, as the fugitives had received too long a start; and the officers turned their attention to the old building, in which they found the distillery in full working order, with the still, worm, and other utensils. The spirits

were poured out, the casks and tubs burned, and the copper articles carried off as prizes.

This seizure put an end to the operations of the gang for a considerable time, as they could not afford to buy new plant, the smuggler being generally poor in spite of his illegal dealings. This state of poverty is a little surprising, when one considers that the duty on spirits is about five times the cost of the manufactured article; but he makes a great many bad debts when selling his liquor, as his customers are quite aware that he dare not enforce payment.

It will thus be seen that smuggling is not a money-making trade; and if the smuggler were to display as much ingenuity in honest labour as he does in evading the law, he would have a great chance of becoming a prosperous and respected citizen, instead of being a worthless and dissolute character, and living and working in continual fear of punishment for his misdeeds.

PUTTING ONE'S FOOT IN IT.

'I NEVER open my mouth but I put my foot in it,' was the curious complaint of some unlucky wight, who might have received consolation had he reflected on the number of offenders that daily keep him company. The Guardsman's remark to the English nobleman who was in the habit of affably conversing with soldiers, 'I like you, my lord; there's nothing of the gentleman about you,' offers an example of the kind.—'How many deaths?' asked a hospital physician. 'Nine.' 'Why, I ordered medicine for ten.' 'Yes; but one would not take it,' was the startling reply.—'Hillo! where are you going at this time of night?' said a gentleman to his servant. 'You are after no good, I'll warrant.' 'Please, sir, mistress sent me for you, sir,' was the response.—A gentleman said to the waiter of his club: 'Michael, if I should die, would you attend my funeral?' 'Willingly, sir,' was the hasty answer. 'Well, Michael, that isn't very complimentary.' 'No, sir; I didn't mane that, sir: I wouldn't be seen there, sir,' was the waiter's consolatory reply.

A child may often be expected to put his or her heedless little foot in it, as the phrase goes. For instance, a youngster one day begged an invitation to dinner at the house of a little friend with whom he had been playing. At the table, his hostess anxiously inquired: 'Charley, can you cut your own meat?' 'Humph!' said the youngster, who was sawing away; 'can't I? I've cut up quite as tough meat as this at home.' People who are destitute of tact might take warning from such juvenile malaprops, but such does not often appear to be the case, judging by the numerous examples to the contrary.

A millionaire railway-king has a brother who is hard of hearing, while he himself is remarkable as having a very prominent nose. Once this railway-king dined at a friend's house where he sat between two young ladies, who talked to him very loudly, rather to his annoyance, but he said nothing. Finally, one of them shouted a commonplace remark, and then said in an ordinary tone to the other: 'Did you ever see such a nose in all your life?' 'Pardon me, ladies,' said the millionaire; 'it is my brother who is deaf!' We can imagine the horror of the lady who indulged in such

personal remarks, yet she was no more awkwardly placed than the hero of the following. When dining at a certain castle a Mr T—, after the ladies retired, remarked to a gentleman present that the lady who had sat on his right was the ugliest woman he had ever seen. 'I am sorry to hear,' said the gentleman, 'that you think my wife so ill-looking.' 'O no, sir; I meant the lady who sat on my left; I made a mistake.' 'Well, sir, she is my sister.'

Alluding to newspapers, it may be remarked that advertisers and unpractised writers therein, through ambiguity of words and phrases often commit absurdities that may be touched on as further illustrating our subject. A country paper once related how 'during the celebration a child was run over wearing a short red dress, which never spoke afterwards.'—In the description of the doings of a mad dog, it is said that 'he bit a horse on the leg which has since died.'—An account of a funeral says: 'The remains were committed to that bourne from which no traveller returns attended by his friends.'

It is not surprising that foreigners sometimes fail to catch all the shades of meaning belonging to our words. A Frenchman translated Shakespeare's line, 'Out, brief candle,' by, 'Get out, you short candle.' And the expression, 'With my sword I will carve my way to fortune,' was rendered, 'With my sword I will make my fortune cutting meat.'

Advertisers often give us amusing specimens of composition, of which this is an example: 'Lost by a poor lad tied up in a brown paper with a white string a German flute with an overcoat on and several other articles of wearing apparel.'—A miller attempted to testify to the merits of a powder for destroying vermin by saying, 'A fortnight ago I was full of rats, and now I don't think I have one.'

Examples more of the 'bull' genus also come under the title of this paper as cases in point. For instance, a newspaper was running a serial story called 'The Truth.' One week, so much space being devoted to other matters, the editor was unable to continue the story, so made the following announcement, containing perhaps more truth than any other item in the paper: "'The Truth' was crowded out of this issue on account of the press of more important matter.'

A bashful gentleman who visited a school kept by a young lady was asked by the teacher to say a few words to the pupils. This was his speech: 'Scholars, I hope you will always love your school and your teacher as much as I do.' A tableau of giggling pupils and a blushing teacher attested the effectiveness of his words.

The lecturer put his foot in it as thoroughly when he prefaced his discourse upon the rhinoceros with, 'I must beg you to give me your undivided attention; indeed, it is absolutely impossible that you could form a true idea of the hideous animal of which we are about to speak, unless you keep your eyes fixed on me.'—A certain preacher discoursing upon Bunyan and his works, caused a titter among his hearers by exclaiming, 'In these days, my brethren, we want more Bunyans.'—Another clergyman pleading earnestly with his parishioners for the construction of a cemetery for their parish, asked them to consider the 'deplorable condition of thirty

thousand Christian Englishmen living without Christian burial.'—Still more curious was the clerical slip with which we conclude. A gentleman said to the minister, 'When do you expect to see Deacon S— again?' 'Never,' said the reverend gentleman solemnly; 'the deacon is in heaven.'

GARNERED SUNSHINE.

THESE early autumn days have a peculiar charm all their own. Almost all the birds have ceased to sing; the busy hum of summer's multitudinous life has languished, and finally died away; the Earth is brooding over her perfected harvests, murmuring the while a dreamy lullaby which cannot be attuned to our measured words. As I walk to-day between dusty hedgerows along a white glare of sunlit highway leading to the harvest-fields, I can hear the sound of the reaping-machine on every side. It is a moaning sound, and seems to presage the autumn winds. But there is no wind, no cooling breeze to-day; the air is sultry, and so very still that the spinning vibrations caused by the wings of unfortunate flies, entangled in the glistening festoons of the spiders' webs, is distinctly audible. An ominous dark-blue cloud with a lurid electric light in its centre is coming up from the north. We shall have thunder ere long, although the basking sunshine still slants upon the mellow fields of golden grain, flecked with scarlet poppies. Tremulous movements in the hedges betray the presence of the silent birds; but a restless bullfinch flits before me, hurriedly pausing to whistle his abruptly terminating song; and a landrail sends his monotonous 'Crake, crake!' over a distant clover-field. I wonder if the landrail is a ventriloquist? Certainly, he is oftener heard than seen.

I follow the road past an old farmhouse, and immediately strike into a wheat-field in which the reapers are busy. A row of standing stooks redolent with the narcotic scent of withering poppies fringes the half uncut grain, and under one of these I rest awhile. How unswervingly, how regularly does the reaping-machine cut down the proud ranks of grain; how swiftly do the stooping reapers follow behind, binding the swaths into sheaves, and arranging them with picturesque precision at intervals along the crackling stubble. One could fancy that the sunshine of the summer had not fled after all, but had taken tangible form in this field of golden wheat. It is more than harvested grain, for it is garnered sunshine: summer is imprisoned in the sunny wheat. The sparrows which I have missed from the woodlands are here in chirping flocks; cheeriest of gleaners, how they revel among the stubble. I, too, will pluck a gleaner's handful of the embodied sunshine, to brighten my wall at home when the firelight flickers, and the snow taps at the windows with soft, treacherous fingers.

On a day like this, one envies the farmer and his men their close proximity to Nature. True, they wait upon her to further their own ends, and they must be ever at her beck and call; but think of the band of aerial forces she sends to aid the farmer in his toil! The sun, the wind, the rain,

the moon, the dew—these are the willing spirits he tethers to his ploughshare. He is at once their slave and their master. He must do their bidding if he would guide those sovereign forces to help him to win the harvest of the earth. Do they tarry in their coming? Then must the farmer be patient, and not in haste. He must work late or early; he must hurry or he must pause as his omnipotent servants decree. They will only serve him if he walks in the inflexible grooves of their natural laws; then only will the farmer prosper.

In the next field the thrashing-machine is at work, and women are engaged in filling their mattresses with the fresh light chaff. The hedge which separates the two fields is brilliant with the polished scarlet fruit of the dog-rose, and with many-coloured bramble sprays laden with berries in every stage of ripening, from the first faint blush of red to the luscious purple bloom of complete fruition. The thistle-down is floating like fairy shuttlecocks on the still air; and with every darting movement of the birds in the hedges, the ripe thistle-heads are shaken free of their buoyant winged seeds. The umbelliferous plants have lost their crowns of white florets and are now seeding. They are an ambitious race, and are not content with their five feet of summer growth, but must needs hurry after the departing summer with awkward lengths of useless stalk and sickly flower-umbels which will never reach perfection. These unsightly late sprouts are the hasty after-thoughts and parentheses of an over-prolific parent stem, and are destined to be overtaken and killed by the early frosts. The foliage of the lowly herb-Robert brightens the dusty grass beneath the hedges, sending a crimson wandering fire along the verdant line that fringes the sun-baked highway; and the camomile flower with its feathery foliage has supplanted the ox-eyed daisy.

I have almost trodden upon a quaint little ball of withered grass blades deftly and compactly plaited together and fastened to some ears of cut wheat. This I am told by a reaper is the tiny nest of a field-mouse. As far as I can see, there is no apparent ingress or egress; it is merely a round soft ball. A quaint and wonderful piece of architecture it seems to my astonished eyes, especially when I learn that these tiny homes sometimes contain seven young mice. I also find and carry off as a treasure a deserted linnet's nest. It was placed in the bushy hollow of a hawthorn hedge; and so beautifully dainty is it in structure and in colour, that I may be pardoned the passing thought that birds may possibly possess more or less of an artistic feeling for colour and form.

But now the portentous calm of the afternoon is broken by a distant muttering of thunder. The cloud was nearer, or has travelled quicker than I reckoned upon; the birds leave the stubble and fly low, hastening to their leafy coverts; and I make my way to the shelter of the ancient doorway of the farmhouse and there stand watching the gathering storm. The sun has disappeared behind the rising sullen blue clouds, and swift, with a heavy pattering fall, the big raindrops strike the hissing dust. There is a flash of zigzag lightning, followed by a peal of thunder that cracks overhead as if the sky was rending. Faster

falls the rain in a deluge of plashing water. How quick the dust licks up the welcome torrent! Again and yet again the lightning flashes and the thunder growls; but the cloud is very local, and gradually it moves across the sky, carrying with it a last peal of thunder, which dies in the distance just as the azure sky escapes once more from the ragged edge of the retreating cloud. Once more the sun shines forth through still falling rain, and lo! a gorgeous rainbow flings its arching span against the dark cloud, and shines with sevenfold radiance in the face of the golden sun. Upward rises a lark from a gleaming wet clover-field, singing as he climbs into the sunny air. See how white his sun-flecked breast looks against the thunder-cloud! Now he has reached the centre of the rainbow arch, and there he hangs, as if suspended by an invisible thread, singing in an ecstasy of joy.

I issue from my shelter and turn homeward; but the hedges are indistinct, and the road almost lost within a fragrant mist of incense sent up by the grateful earth. Gradually the warm vapour is absorbed by the strong sun; the delicious odour of earth fills the air, and mingles with the clammy sweetness of a hidden honeysuckle. I walk upon enchanted ground, picking my steps among pools of water which look like broken fragments of the rainbow overhead, and fallen sapphires from the blue. My path is radiant with jewels; for the raindrops that twinkle on hedgerow and grass have become emeralds and rubies and flashing diamonds by the magic power of the sun.

THE LAME BOY.

BEHIND the ridge of Primrose Hill,

On summer evenings cool and bright,

Gay crowds of careless urchins fill

The air with sounds of laughter light.

There once I strolled in thoughtful mood,

Delighted busy life to scan,

For seldom sweet is solitude

To one that loves his fellow-man.

A cricket-match! From canvas tent,

That spread bright banners to the day,

With bat in hand and body bent,

A tiny cripple came to play.

'Well hit, well hit! Bob wins the game!'

Soon rose in many a lusty shout,

While flushed and proud, with eager aim

He drove the lazy balls about.

The fielders must have lost their strength;

The bowler bowls with errant eye;

It dawns on little Bob at length

The melancholy reason why.

A moment's pause—and then, all gone

The glory of the ringing cheers;

He drew his little jacket on,

And burst into a storm of tears.

PRICE 1½d.

A DAY WITH THE MISERECORDIE.

It is Sunday morning, and our ship steams slowly into Leghorn harbour under the bluest of Italian skies. We hire a wherry, and go ashore, glad to escape for a time the monotonous roll of the wave-washed vessel. Hardly have we crossed the city's threshold, when we come upon a weird procession of hooded men, carrying on their shoulders an empty litter. We are told they are the famous Miserecordie; so we follow until they reach their chapel, and go in after them. Our questions are kindly answered by a 'brother' whose face we cannot see, and we are soon investigating for ourselves the mysteries of this solemn brotherhood. It goes without saying that no religious body anywhere is held in greater respect and veneration than the Italian Miserecordie. While distinctly Roman Catholic in denomination, it ministers to the wants and sufferings of all creeds and classes. We are unable to ascertain exactly the date of its foundation; but there can be no doubt, from all accounts, that it has been in active operation for upwards of a century. It was founded by a Florentine, who sought in a humble way to alleviate the sufferings of his poorer townsmen; but little did the good Samaritan imagine the extent to which his ideas were destined to be carried out long after his bones were crumbling dust.

The Order of Miserecordie embraces both men and women. The former at their initiation pay an entrance fee of six francs and an annual sum of four francs by way of dues. The latter pay four francs at initiation and yearly dues to the amount of two francs. There are honorary members also, who do no active work and who pay five francs a year. The only direct benefit these brethren receive from their membership is that their bodies and those of their families are buried in the private and beautiful cemetery belonging to the Order. There is no fund upon which they may draw in times of sickness; no superannuation on which they may retire in old age; there are no mystic signs or

secret words; and politics are unknown in the ranks.

The mission of the Miserecordie is to relieve suffering, to watch by the sick and dying, to convey the wounded to the hospitals, to carry the dead to the tomb, and to be impartial always in their services to whosoever may require them. The dress of the Order consists of a long black frock and hood, in the latter being cut two eye-holes. Save for these, the wearer is completely enveloped, and is absolutely unrecognisable. The idea of this is that individual pomp and vanity may be sunk and crucified, and so the brethren go about in the performance of their good work unknown. The amount of labour overtaken by the Order is not easily calculated. It is for ever 'on duty,' and the demands made upon it are enormous.

The public ambulance is a thing as yet unknown to the Italian police, and in order themselves to escape the unpleasant duty of caring for and conveying the sick and wounded to the hospitals, the authorities are only too glad that it should be performed by the Miserecordie. So thoroughly is the work established, so widely the brethren known, that the people come directly to them with their messages and demands, without applying to the authorities at all. If a man is hurt in the street, the Miserecordie turn out at once and take him tenderly, in the cleanest and whitest of stretchers, to the nearest hospital; or to his own house, if he has one. If a weak or bedridden householder has to be moved from one room to another, a message to the Miserecordie will bring strong men to do the work. If a doctor has a dying patient too poor to afford the luxury of a nurse, he leaves word with the Miserecordie, and nurses are at once sent out in turn to tend and nurse him back to convalescence, or until death relieves them of their weary vigils.

It must not be imagined that because the Order is a Roman Catholic one, its services are offered only to its co-religionists. It goes anywhere, at any time, to do what good it can to fellow-men, and church and creed give way before the sacred

call of humanity. Many an English sailor crushed and hurt in Italian harbours, and many a friendless foreigner, have good reason to remember and bless the Miserecordie for their gracious and most timely help. Payment for its labours is sternly refused; the rule is imperative that not even a cup of cold water shall be asked or taken by a brother while services are being rendered. Through the crowded streets, however, and passing in and out of shops and houses, may be seen the grim black figures with their poor-boxes, soliciting contributions; and there are few who pass them by without a blessing and a coin.

During the day, a few taps on their huge alarm-bell suffice to bring together a sufficient number of brethren for the performance of any ordinary duty. During the night, however, a relief is always kept on the premises, ready to issue forth at a moment's notice. On the sound of an alarm, the brethren run quickly to headquarters, don their black robes, and give their names to the senior member present, who notes and marshals them. When the duty is performed, the brethren are dismissed, and the case attended to is carefully entered in the Society's books. Whenever a brother has completed one hundred and fifty such services, he receives the Society's bronze medal, which is highly prized, and worn at the girdle. When he has answered five thousand calls, he is entitled to the silver medal, which is worn on the breast; but as such a course of duties must necessarily be spread over a long period of years, the wearers are few and far between, and always old and venerable men.

The ranks are composed of all classes of society, and it is well known that during his lifetime the late Grand-duke of Tuscany was himself the most active of this noble band. During the cholera plagues, the labours of the Society were almost superhuman; and it speaks volumes for the respect in which it is held, when it is remembered that during the most stirring times in Italian history, when no processions or bodies dared walk abroad unguarded or unarmed, the members of the Miserecordie went everywhere, alone, doing their quiet good work under the shadow of their uplifted crucifix.

Everything connected with the Society is neat and scrupulously plain, and there is an utter absence of display, which more pretentious orders would do well to imitate. Behind the chapel are kept the hearses, stretchers, portable beds, country ambulances, and other appliances used. All are clean and fresh and ready for immediate use.

We re-enter the little chapel, where a mass is being sung for the souls of the departed brethren, and we see on all sides ghastly skulls and covered coffins to remind us of our latter end. The incense-swingers perfume the air, and our ears are ravished with enchanting music sung by the choir overhead. The priests go round the people and distribute candles; and we light ours, that we may not appear singular, and gaze curiously on the scene, as if in wonderland. As we pass out, the gray-haired sexton tells us it is the festival of 'All-Souls,' and a day of mourning. He advises us to visit the cemetery, telling us the sight is worth the trouble; and we resolve at once to go. It is the custom in Italy to mourn eight days from the 1st of November for the souls of

the dead. The graves of the loved ones are visited and covered with flowers and wreaths and pretty gifts, while masses are sung for them in all the churches. At the end of eight days the decorations are removed, the priests put off their brodered robes, and the graveyard gates are closed again until next year's mourning-time comes round.

A drive of fifteen minutes through pretty hedgerows banked with nodding daisies brings us to the cemetery. The road is crowded with pedestrians, and at some points blocked with vehicles. So great, indeed, is the confusion that special squads of police are strung out to preserve order, while mounted gendarmes, resplendent in plumes and clanking sabres, gallop about to direct the traffic. The women's dresses, in spite of the solemn occasion, are of the gayest colours; the peasant girls, with their uncovered heads, striped petticoats, and dangling earrings being particularly conspicuous. There are beggars, too, by the score, exhibiting mutilated limbs and festering sores, and calling loudly for the alms not often refused them. An Italian festival of any kind without its beggars would be incomplete. Where they come from or where they go to, how they live and who they are, nobody knows; but they are the most persistent and irrepressible class of beings to be met with in the wide world. They will positively not take a refusal, and this is well illustrated by the lame man, who, forgetful of his infirmities, runs a mile beside our carriage for the copper coin we toss him, and still finds breath to bless us for our charity. At the gate stand two of the Miserecordie, clad in their sombre robes, shaking their poor-boxes at the passing multitude. So weird and silent are they, that but for their eyes, which peer and twinkle through the holes cut in their hoods, they might themselves belong to the sheeted and forgotten dead.

The burying-ground into which we pass lies just outside the Leghorn gates, and almost under the shadow of the Montenero heights. It is laid out with charming nicety, and kept with scrupulous care. The boxwood thickets which form the avenues are neatly trimmed; and above them tower high swinging cypress trees, which yield a grateful shade and cool the gravel footpaths underneath. Of the ground-work and architecture within, too much cannot be said; not that it in any way aims at or approaches grandeur, but because it is full of beauty and always fair to see. We see here chapels within chapels, and gardens within gardens; and there are high vaulted arches and heavy swinging lamps, and dainty flowers that blossom everywhere. Except in the case of family vaults, which are specially prepared and paid for, no man in this quaint resting-place may choose beforehand the spot where he will be laid. This is done for him by the ground committee, with a view to the symmetry and beauty of the establishment. Thus, gravestones lie in shape of stars and crosses and intersected squares; whilst others are built into the walls one above the other, till the rough masonry gives place to smooth and polished marble.

The rich and poor lie here together, sleeping their common sleep; brethren in life, in death they are not divided, and pomp and vanity give

place to the memory of simple worth. The marble slabs and monuments that mark the graves are of various shapes and sizes. This is a matter in which the tastes and pockets of the surviving relatives may be consulted without reference to the Society or its committees. The simple slab, the stately cross, the broken pillar, the mass of marble rock, may all be seen, and some of them are veritable works of art. But it would seem to be an understood, if, indeed, it is not a written rule, that the epitaphs upon them shall at any-rate be short and simple. Here are to be found no eulogies, or histories, or sounding phrases; little but the names of the silent sleepers meet the eye, unless it be the 'Pray for him' with which most of the inscriptions end.

On every grave we see floral decorations and tributes of affection, brought by loving hands. The gifts and garlands vary with the station in life of the givers; but as far as we can see, after a long and careful visit, none are quite forgotten. On many of the tombstones are the photographs of the departed, some of them let cunningly into the marble in neat metal frames, and in no way affected by the exposure to light or storm. Here are graves smothered in a wealth of rare exotics, while beside them stand exquisitely worked tablets in silk and plush and satin, scrolled with endearing terms. There are gloomy lamps or burning candles beside each sepulchre, and the air is laden with the sweet perfume of incense.

The graves of the poor have simpler flowers; occasionally, only artificial garlands and little oil-lamps. On some are scattered merely a handful of rose-leaves, whilst on others are jars of common clay with a single bud bending to the breeze. On one mound is the bottom of a broken vase, and from it there rises a carefully cut and prettily trimmed maize-cane, the delicate flowers being doubtless beyond the reach of the humble giver. On another heap is a little cross rudely fashioned out of a piece of decaying wood. The size is infinitesimal, and the work suggestive of a boy's penknife; but it speaks volumes of love and sympathy. Indeed, the offerings of the poor have a pathetic tenderness never to be found in those of the rich.

Beside the flickering lamps and guttering candles, on all sides are kneeling men and women, whispering their prayers for the loved ones they may see no more. Here bends a little lad beside his mother's tomb, stroking the marble headstone, and thinking of the dear voice hushed for ever; and here a gray-haired couple are gazing at the grave of the son who has been taken from them all too soon. Here is a woman in an agony of grief over a little mound on which the grass has not yet grown. Her grief is pitiable to behold, and her cries attract a sympathising crowd, and cause many a tear to start from eyes whose fountains open responsive to chords struck in aching hearts. 'Bianca, my little love,' she cries, 'I am here beside you! It is your mother, darling, who speaks to you, and longs to see you! The world is dark without you, darling! Oh, speak to me. Come back to me, my love, my love!' Her face is swollen with the hot tears which chase each other down her cheeks; her lips are smeared with the damp earth to which she presses them. She is but a peasant woman, this sorrowing mother; her hands

are large and coarse and tanned by the burning sun, under which she labours day by day; her hair is matted with the wind; but her heart is pure and tender and true, and her tears are an index of a gentleness that wealth can never buy.

The family vaults are built into and underneath the inner walls of this pretty labyrinth, and are models of neatness. Most of them contain little chapels and neat *priedieus*, and the floors shine with polished marble. The walls and ceilings are exquisitely frescoed, and the sunbeams play upon the silver altar ornaments and rob the grave of gloom. Beneath, where the coffins lie in their metal caskets, oil-lamps are kept perpetually burning; whilst huge bronze crosses stretch out their arms, as if to cover with their shadows the slumbering dead.

Not a laugh is to be heard through all the multitude as we pass round. The sightseer and the tourist seem to catch the general sadness and talk in whispers as they go. The day has been one, indeed, of sad reflection and bitter memory, and laughter would grate harshly here.

We near the gate again as the sun is sinking, and we look back upon the congregated mourners. We see the belted soldier and the sandalled monk, the nobleman and the beggar, side by side; we see white faces and raining tears and looks of sorrow everywhere. We stand a moment ere we go, apart, alone, and feel better and purer for the sight. If it be true that the dead have knowledge of the living, the dreamers in this little garden must be gladdened at the loving recollection of their friends.

The horse-bells jingle as we canter homewards and beat a strange accompaniment to our thoughts. Verily, we have lingered in another land with the dead themselves. We have been reminded of a day in which we will ourselves be laid away, and our resting-places visited by those we loved. We have looked on grief and sorrow, the part of all men woman-born. But even as we think, the sun goes down, hiding his head in the blue waters close at hand; and crimson tints shoot up and fall across the land. The birds sing out their even-song, the distant spires are lighted up in yellow glory, and in the distance is heard the soft chiming of the Sabbath bells.

THIS MORTAL COIL.

CHAPTER XXXIX.—AFTER LONG GRIEF AND PAIN.

THE time to stand upon trifles was past. Let him run the risk of meeting Massinger by the way or not, Warren Relf must needs go round and fetch Elsie to comfort and console poor dying Winifred. He hastened away at the top of his speed to the Villa Rossa. At the door, both girls together met him. Elsie had just returned, basket in hand, from the Avenue Vittorio-Emmanuele, and had learnt from Edie so much of the contents of Warren's hasty letter as had been intended from the first for her edification.

Warren drew her aside gently into the tiny salon, and motioned to Edie not to follow them. Elsie's heart beat high with wonder. She was aware how much it made her pulse quicken to see Warren again—with something more than the mere fraternal greeting she pretended. Her little

self-deception broke down at last: she knew she loved him—in an unpractical way; and she was almost sorry she could never, never make him happy.

But Warren's grave face bade her heart stand still for a beat or two next moment. He had clearly something most serious to communicate—something that he knew would profoundly distress her. A womanly alarm came over her with a vague surmise. Could Warren be going to tell her?—Oh no! Impossible. She knew dear Warren too well for that; he at least could never be cruel.

If Warren was going to tell her *that*, her faith in her kind would die out for ever.

'Well, Warren?' she asked with tremulous eagerness, drawing closer up to him in her sweet womanly confidence, and gazing into his eyes, half afraid, half affectionate. How could she ever have doubted him, were it only for a second?

'Elsie,' Warren cried, laying his hand with unspoken tenderness on her shapely shoulder, 'I want you to come round at once to the *pension* on the piazza.—It's better to tell it all out at once. Winifred Massinger's come to San Remo, very ill—dying, I fear. She knows you're here, and she's asked to see you.'

Elsie's face grew red and then white for a moment, and she trembled visibly. 'Is *he* there?' she asked, after a short pause. Then, with a sudden burst of uncontrollable tears, she buried her face in her hands on the table.

Warren soothed her with his hand tenderly, and leaning over her, told her, in haste and in a very low voice, the whole sad story. 'I don't think he'll be there,' he added at the end. 'Mrs Massinger said she wouldn't allow him to enter the room. But in any case—for that poor girl's sake—you won't refuse to go to her now, will you, Elsie?'

'No,' Elsie answered, rising calmly with womanly dignity, to face it all out. 'I *must* go. It would be cruel and wicked of course to shirk it. For Winifred's sake, I'll go in any case.—But Warren, before I dare to go'—She broke off suddenly, and with a woman's impulse held up her pale face to him in mute submission.

A thrill coursed through Warren Relf's nerves; he stooped down and pressed his lips fervently to hers. 'Before you go, you are mine then, Elsie!' he cried eagerly.

Elsie pressed his hand faintly in reply. 'I am yours, Warren,' she answered at last very low, after a short pause. 'But I can't be yours as you wish it for a long time yet. No matter why. I shall be yours in heart.—I couldn't have gone on any other terms. And with that, I think, I can go and face it.'

At the *pension*, Hugh had already brought the English doctor, who went in alone to look after Winifred. Hugh had tried to accompany him into the bedroom; but Winifred, true to her terrible threat, lifted one stern forefinger before his swimming eyes and cried out 'Never!' in a voice so doggedly determined that Hugh slunk away abashed into the anteroom.

The English doctor stopped for several minutes in consultation, and Winifred spoke to him, simply and unreservedly, about her husband.

'Send that man away!' she cried, pointing to Hugh, as he stood still peering across from the gloom of the doorway. 'I won't have him in here to see me die! I won't have him in here! It makes me worse to see him about the place. I hate him!—I hate him!'

'You'd better go,' the doctor whispered softly, looking him hard in the face with his inquiring eyes. 'She's in a very excited, hysterical condition. She's best alone, with only the women.—A husband's presence often does more harm than good in such nervous crises. Nobody should be near to increase her excitement.—Have the kindness to shut the door, if you please. You needn't come back for the present, thank you.'

And then Winifred unburdened once more her poor laden soul in convulsive sobs. 'I want to see Elsie! I want to see Elsie!'

'Miss Challoner?' the doctor asked suggestively. He knew her well as the tenderest and best of amateur nurses.

Winifred explained to him with broken little cries and eager words that she wished to see Elsie in Hugh's absence.

At the end of five minutes' soothing talk, the doctor read it all to the very bottom with professional acuteness. The poor girl was dying. Her husband and she had never got on. She hungered and thirsted for human sympathy. Why not gratify her yearning little soul? He stepped back into the bare and dingily lighted sitting-room. 'I think,' he said persuasively to Hugh, with authoritative suggestion, 'your wife would be all the better in the end if she were left entirely alone with the womenkind for a little. Your presence here evidently disturbs and excites her. Her condition's critical, distinctly critical. I won't conceal it from you. She's over-fatigued with the journey and with mental exhaustion. The slightest aggravation of the hysterical symptoms, might carry her off at any moment. If I were you, I'd stroll out for an hour. Lounge along by the shore or up the hills a bit. I'll stop and look after her. She's quieter now. You needn't come back for at least an hour.'

Hugh knew in his heart it was best so. Winifred hated him, not without cause. He took up his hat, crushed it fiercely on his head, and strolling down by himself to the water's edge, sat in the listless calm of utter despair on a bare bench in the cool fresh air of an Italian evening. He thought in a hopeless, helpless, irresponsible way about poor dead Elsie and poor dying Winifred.

Five minutes after Hugh had left the *pension*, Warren Relf and Elsie mounted the big centre staircase and knocked at the door of Winifred's bare and dingy salon. The *patron* had already informed them that the signor was gone out, and that the signora was up in her room alone with the women of the hotel and the English doctor.

Warren Relf remained by himself in the anteroom. Elsie went in unannounced to Winifred.

Oh the joy and relief of that final meeting! The poor dying girl rose up on the bed with a bound to greet her. A sudden flush crimsoned her sunken cheeks. As her eyes rested once more upon Elsie's face—that earnest, serious, beautiful face she had loved and trusted—every shadow of fear and misery faded from her look,

and she cried aloud in a fever of delight: 'O Elsie, Elsie, I'm glad you've come. I'm glad to hold your hand in mine again; now I can die happy!'

Elsie saw at a glance that she spoke the truth. That bright red spot in the centre of each wan and pallid cheek told its own sad tale with unmistakable eloquence. She flung her arms fervently round her feeble little friend. 'Winnie, Winnie!' she cried—'my own sweet Winnie! Why didn't you let me know before? If I'd thought you were like this, I'd have come to you long ago!'

'Then you love me still?' Winifred murmured low, clinging tight and hard to her recovered friend with a feverish longing.

'I've always loved you; I shall always love you,' Elsie answered slowly. 'My love doesn't come and go, Winnie. If I hadn't loved you more than I can say, I'd have come long since. It was for your own sake I kept so long away from you.'

The English doctor rose with a sign from the chair by the bedside and motioned the women out of the room.—'We'll leave you alone,' he said in a quiet voice to Elsie.—'Don't excite her too much, if you please, Miss Challoner. But I know I can trust you. I leave her in the very best of hands. You can only be soothing and restful anywhere.'

The doctor's confidence was perhaps ill advised. As soon as those two were left by themselves—the two women who had loved Hugh Massinger best in the world, and whom Hugh Massinger had so deeply wronged and so cruelly injured—they fell upon one another's necks with a great cry, and wept, and caressed one another long in silence. Then Winifred, leaning back in fatigue, said with a sudden burst: 'O Elsie, Elsie! I can't die now without confessing it, all, every word to you: once, do you know—more than once I distrusted you!'

'I know, my darling,' Elsie answered with a tearful smile, kissing her pale white fingers many times tenderly. 'I know, I understand. You couldn't help it. You needn't explain. It was no wonder.'

Winifred gazed at her transparent eyes and truthful face. No one who saw them could ever distrust them, at least while he looked at them. 'Elsie,' she said, gripping her tight in her grasp—the one being on earth who could truly sympathise with her—'I'll tell you why: he kept your letters all in a box—your letters and the little gold watch he gave you.'

'No, not the watch, darling,' Elsie answered, starting back.—'Winnie, I'll tell you what I did with that watch: I threw it into the sea off the pier at Lowestoft.'

A light broke suddenly over Winifred's mind; she knew now Hugh had told her the truth for once. 'He picked it up at Orfordness,' she mused simply. 'It was carried there by the tide with a woman's body—a body that he took for yours, Elsie.'

'He doesn't know I'm alive even now, dearest,' Elsie whispered by her side. 'I hope while I live he may never know it; though I don't know now how we're to keep it from him, I confess, much longer.'

Then Winifred, emboldened by Elsie's hand, poured out her full grief in her friend's ear, and

told Elsie the tale of her long, long sorrow. Elsie listened with a burning cheek. 'If only I'd known!' she cried at last. 'If only I'd known all this ever so much sooner! But I didn't want to come between you two. I thought perhaps I would spoil all: I fancied you were happy with one another.'

'And after I'm dead, Elsie, will you—see him?'

Elsie started. 'Never, darling,' she cried. 'Never, never!'

'Then you don't love him any longer, dear?'

'Love him? Oh no! That's all dead and buried long ago. I mourned too many months for my dead love, Winifred; but after the way Hugh's treated you—how could I love him? how could I help feeling harshly towards him?'

Winifred pressed her friend in her arms harder than ever. 'O Elsie!' she cried, 'I love you better than anybody else in the whole world. I wish I'd had you always with me. If you'd been near, I might have been happier. How on earth could I ever have ventured to mistrust you!'

They talked long and low in their confidences to one another, each pouring out her whole arrears of time, and each understanding for the first moment many things that had long been strangely obscure to them. At last Winifred repeated the tale of her two or three late stormy interviews with her husband. She told them truthfully, just as they occurred—extenuating nothing on either side—down to the very words she had used to Hugh: 'You've tried to murder me by slow torture, that you might marry Elsie:' and that other terrible sentence she had spoken out that very evening to Warren: 'He shall not enter this room again till he enters it to see me laid out for burial.'

Elsie shuddered with unspeakable awe and horror when that frail young girl, so delicate of mould and so graceful of feature even still, uttered those awful words of vindictive rancour against the man she had pledged her troth to love and to honour. 'O Winifred!' she cried, looking down at her with mingled pity and terror traced in every line of her compassionate face, 'you didn't say that! You could never have meant it!'

Winifred clenched her white hands yet harder once more. 'Yes, I did,' she cried. 'I meant it, and I mean it. He's hounded me to death; and now that I'm dying, he shan't gloat over me!'

'Winnie, Winnie, he's your husband, your husband! Remember what you promised to do when you married him. Oh, for my sake, and for your own sake, Winnie, if not for his—do see him and speak to him, just once, forgivingly.'

'Never!' Winifred answered, starting up on the bed once more with a ghastly energy. 'He's driven me to the grave: let him have his punishment!'

Elsie drew back, more horrified than ever. Her face spoke better than her words to Winifred. 'My darling,' she cried, 'you *must* see him. You must never die and leave him so.' Then in a gentler voice she added imploringly: 'Forgive us our trespasses, as we forgive them that trespass against us.'

Winifred buried her face wildly in her bloodless hands. 'I can't,' she moaned out; 'I haven't

the power. It's too late now. He's been too cruel to me.'

For many minutes together, Elsie bent tenderly over her, whispering words of consolation and comfort in her ears, while Winifred listened and cried silently. At last, after Elsie had soothed her long, and wept over her much with soft loving touches, Winifred looked up in her face with a wistful gaze. 'I think, Elsie,' she said slowly, 'I could bear to see him, if you would stop with me here and help me.'

Elsie shrank into herself with a sudden horror. That would be a crucial trial, indeed, of her own forgiveness for the man who had wronged her, and her own affection for poor dying Winifred. Meet Hugh again, so painfully, so unexpectedly! Come back to him at once, from the tomb, as it were, to remind him of his crime, and before Winifred's eyes—poor dying Winifred's! The very idea made her shudder with alarm. 'O Winnie,' she cried, looking down upon her friend with her great gray eyes, 'I couldn't face him. I thought I should never see him again. I daren't do it. You mustn't ask me.'

'Then you haven't forgiven him yourself!' Winifred burst out eagerly. 'You love him still! You love him—and you hate him!—Elsie, that's just the same as me. I hate him—but I love him; oh! how I do love him!'

She spoke no more than the simple truth. She was judging Elsie by her own heart. With that strange womanly paradox we so often see, she loved her husband even now, much as she hated him. It was that indeed that made her hate him so much: her love gave point to her hatred and her jealousy.

'No, darling,' Elsie answered, bending over her closer and speaking lower in her ear than she had yet spoken. 'I don't love him; and I don't hate him. I forgive him all! I've forgiven him long ago.—Winnie, I love some one else now. I've given my heart away at last, and I've given it to a better man than Hugh Massinger.'

'Then why won't you wait and help me to see him?' Winifred cried once more in her fiery energy.

'Because—I'm ashamed. I can't look him in the face; that's all, Winnie.'

Winifred clung to her like a frightened child to its mother's skirts. 'Elsie,' she burst out, with childish vehemence, 'stop with me now to the end! Don't ever leave me!'

Elsie's heart sank deep into her bosom. A horrible dread possessed her soul. She saw one ghastly possibility looming before them that Winifred never seemed to recognise. Hugh kept her letters, her watch, her relics. Suppose he should come and—recognising her at once—betray his surviving passion for herself before poor dying Winifred! She dared hardly face so hideous a chance. And yet, she couldn't bear to untwine herself from Winifred's arms, that clung so tight and so tenderly around her. There was no time to lose, however: she must make up her mind. 'Winifred,' she murmured, laying her head close down by the dying girl's, 'I'll do as you say. I'll stop here still. I'll see Hugh. As long as you live, I'll never leave you!'

Winifred loosed her arms one moment again, and then flung them in a fresh access of feverish fervour round her recovered friend—her dear

beautiful Elsie. 'You'll stop here,' she cried through her sobs and tears; 'you'll help me to tell Hugh I forgive him.'

'I'll stop here,' Elsie answered low, 'and I'll help you to forgive him.'

SOME OLD BRITISH BALLADS.

I.—OUDENARDE.

IN noticing some of our old national ballads we do not intend to touch upon the early and richer stores with which our literature is abundantly provided; it is with an offshoot of the earlier ballads that we shall briefly deal—minor ballads, of a much later date, but also having an historical setting. When the printing-press began to be really established in our country, an immense number of booksellers started up in London and the provinces, and from their presses were issued numberless Merrie, Sad, Trew, or Excellente ballads, meant expressly for the perusal or edification of the people. These productions were published, many of them in black-letter, in broad-sheet form, on bad paper, and were sold for a halfpenny or a penny. Some of these were merely reprints of older ballads; others were re-dressed by the booksellers' scribes; and others, again, were original productions relating to past or contemporary events. Many of these ballads have true merit, and seem to fire us with some of the ardour of the heroes about whom we are reading. They were all written to the tune of some well-known melody; and they must have had a decided hold on the minds of the attentive audience. The morality of most of them is nearly irreproachable, and in many instances of a high order. There were also a goodly number of ballads recording 'the deeds of daring-do' of highwaymen, vicious apprentices, and the 'last scaffold confessions' of notorious malefactors. Still, even in these instances, though there was many a screw loose in the narration, yet they generally terminated with a sound moral. Most of the offenders repented at last, or were overtaken by retributive justice.

The wars of Marlborough may to a great extent be said to have been popular in England, and probably the best proof of this is to be found in the number of songs and ballads which the wars called forth from our common presses. Marlborough, Prince Eugene, and their generals, met with fulsome praise, descending often to extravagance. The battle of Oudenarde, fought on the 11th of July 1708, appears to have made a special impression on the public at home. We find two old black-letter ballads celebrating the event. The first—*A Happy Memorable Ballad, on the fight near Audenarde, between the Duke of Marlborough of Great Britain and the Duke of Vendome of France: as also the strange and wonderful manner how the Princes of the Blood-royal of France were found in a wood*—is

interesting, romantic, and extremely patriotic and loyal :

God prosper long our gracious Queen,
Our lives and safeties all,
A woeful fight of late did
Near Audenarde befall.

It was to drive the French army away from Oudenarde that the Great Duke went with gun and sword ; and the valiant commander called heaven to witness that Vendome should have to 'pay full dear' for the capture of Ghent and Bruges, even before the fame of these events should reach fair France. With this intent, he advanced with his 'eighty thousand bold and chosen men of might' against the hundred thousand Frenchmen, to 'a charge and bloody fight.'

The gallant Britons swiftly ran,
The French away to chase ;
On Wednesday they began to fight,
When daylight did decrease ;
And long before high night, they had
Ten thousand Frenchmen slain,
And all the rivers crimson flowed,
As they were dyed in grain.

Now, the Britons, in eager pursuit of the flying foes, came to certain woods ; and in order the nimble French to take, made both hills and dales and every tree shake with the roar of their musketry. The Duke made his way to these woods in the hope of meeting Vendome ; but instead, he found the Prince de Carignan, one of the French generals, who

Fell at His Grace's feet—
'Oh ! gentle Duke, forbear, forbear
Into that wood to shoot.'

For, it would seem, His Grace would there find the hopes of the royal line of France, Great Louis's heirs, lying fast asleep.

What heart of flint but must relent,
Like wax before the sun,
To see their glory at an end,
Ere yet it was begun.

When Vendome saw the battle was about to commence, said Carignan, and in order to please the two grandsons of Louis, who had been entrusted to his care, he straightway sent them to the top of a church spire—

Where they might see and yet be safe
From swords, and guns, and fire.

He first kissed them tenderly, and then went about his business, unheeding the tears in their little eyes, which seemed 'to forecast events,' but promising to return after the big fight was done. But, alas, when he saw his men give way, away he basely ran, leaving the children all alone. They, 'as babes wanting relief,' grew frightened, came down from their high perch, and wandered about hand-in-hand until they came to the wood, where they sat down and cried 'when they saw the night grow dark.' At this piteous narrative the good Duke was inwardly moved:

His breast fast pity beat,
And so he straightway ordered
His men for to retreat.

But now the ballad leaves the children, and gives us a brief glimpse of the fight :

And now, but that my pen is blunt,
I might with ease relate
How fifteen thousand French were took,
Besides what found their fate.
Nor would the Prince of Hanover
In silence be forgot,
Who like a lion fought on foot,
After his horse was shot.
And what strange chance likewise befell
Unto the children dear,
But that your patience is too much
Already tired, I fear.
And so God bless the Queen and Duke,
And send us lasting peace,
That wars and foul debate henceforth
In all the world may cease.

If we read this ballad by the light of chronology, we must perforce come to the conclusion that the pretty tale of the royal babes is a figment of romance. As a matter of fact, Louis XIV. did send his two grandsons to the wars: the Duke of Burgundy, who was sixteen, as commander ; and the Duke of Berry, who was twelve years old, as a pupil. To say the least of it, it is unlikely that youths of that age brought up to martial habits, would have sat down and cried when their dry-nurse was not forthcoming. Both the young princes met with untimely and cruel deaths, it is said, at the hands of their uncle, the Duke of Orleans.

In *Old England's New Triumph ; or the Battle of Audenarde*, published soon after the event, we have a rather malicious account of it :

Ye Britons, give ear
To my story, and hear
How Churchill, the chief of commanders,
Has gained new renown
To himself and the crown
By outwitting the Monsieurs in Flanders.

The third stanza tells us :

As his troops did advance,
The young squire of France
On a church, with his brother, was seated ;
And fearless from far
Saw the terrible war,
And in order, when routed, retreated.

Sad to say :

The knight of St George,
A tale I don't forge,
Achieved no great matters to brag on ;
The youth did not fight,
Like St George, or his knight,
Though young Hanover did like a dragon.

'Young Hanover,' whose character, sooth to say, will not bear very strict investigation, was a great favourite with these merry bards.

But we have a more biting and amusing account of the fight in a ballad entitled *The Frenchman's Defeat*. It is not so romantic, and rather more libellous and braggadocio in tone :

Ye Commons and Peers,
Pray, lend me your ears ;
I'll sing you a song if I can,
How Louis le Grand
Was put to a stand
By the arms of our Gracious Queen Anne.

How his army so great
Had a total defeat
Not far from the river Dender ;
Where his grandchildren twain,
For fear of being slain,
Galloped off with the popish Pretender.

To a steeple on high,
The battle to spy,
Up mounted these clever young men ;
And when from the spire
They saw so much fire,
They cleverly came down again.

They then got on horseback, at the advice of Vendome, who cried to Burgundy : ' I wish you and your brother were at home.' And the trio immediately made their escape—the rhymester comparing their heels to cork and their hearts to lead. But we must turn to the song again, and see that

Not so did behave
The Young Hanover brave
In this bloody field, I assure you ;
When his mare-horse was shot,
Yet he mattered it not,
But charged still on foot like a fury.

And so it runs on, cracking up ' Young Hanover :'

This gallant young man,
Being kin to Queen Anne,
Fought, as were she a man, she would do.

Perhaps this latter ballad sticks closer to historical accuracy—at all events, it seems more probable. Still, we must not forget that although all historians do ample homage to the Electoral Prince of Hanover—who was afterwards our George II.—there are writers who have defended the young Pretender, and declare he proved his mettle that day on the bloody field of battle.

The warlike spirit of the nation in those days is well represented in *The Courageous Boys of several Trades and Callings*, whom the ballad in a lengthy sub-title defines 'as weavers, shoemakers, butchers, dyers, and hatters, in city and country, whose resolution is to march into Flanders after King William, to relieve that country from the French cruelty, and from thence march with him to the conquest of France.' It commences :

Brave boys, we shall soon have an army of those
That will both the French and the papists oppose ;

and goes on to say what grand things they will do—

For every tradesman his calling will leave,
And bright shining armour he resolves to receive.

And, moreover—

The valiant shoemakers in hundreds come,
Resolving to follow the true martial drum,
With flourishing colours to enter the field,
Not fearing to make the proud enemy yield.
Through every country all over the west,
Their loyalty to their good king is exprest,
And under his banner they'll fight till they die,
Or otherwise make our proud enemies flee.

No doubt this ballad would be a favourite with the boys, with the bold and ambitious apprentices. It is a somewhat rickety but bellicose production, conceived in the spirit of those celebrated verses :

Two skinny Frenchmen and one Portugee,
One jolly Englishman can lick 'em all three.

Perhaps, the spirit was a wholesome one in its way, and may account for much in our history which to us seems almost miraculous.

MRS FARQUHARSON'S NIECE.

CHAP. II.—DISCOVERIES.

A COUPLE of weeks glided by. Miss Selwyn was still with us, and, to all appearance, intended to remain. She declared she could not tear herself away ; and I had begun to feel that without her the place would be very dull, though before she came I had never thought of it. I certainly had never met such a lively girl as Doris. She seemed naturally a bit of a wit, and was remarkably quick at repartee. She was, however, astonishingly ignorant of some things. She could scarcely play a note of music, could paint only a very little, seemed to know or care nothing about the modern languages, except the language of flowers, in which she was well versed ; and as for sewing and light fancy-work, her knowledge thereof was nil. I had never seen her use a needle since she came.

Nothing surprised me more than the change her presence had effected in Professor Vaughan. His niece seemed to have acquired an unbounded influence over him, and she used it most unmercifully. Only in the evenings, and not always then, would she allow him to retire to the solitude of his own room and the society of his beloved books, as she called them. Poor old gentleman ! his life was made a burden to him. She would rally him on his bachelor condition, and say that she knew lots of nice 'old girls' who would just suit him. She ordered him, as her cavalier, to attend her in her walks through the Manor grounds, and would not let him off on any excuse ; and if he did succeed in escaping to his room, would sometimes follow him there, and spend with him the greater part of the day, though she must have been a decided hindrance to him. From the first, to use her own expression, she constituted him her own peculiar 'chum ;' and, truth to tell, he was favoured with much more of her society than either her aunt or myself. Privately, I thought Miss Selwyn a bit of a flirt, as she showed such a predilection for masculine society ; but Mrs Farquharson seemed quite well pleased, more so, indeed, I fancied, than on the occasions when Miss Selwyn and I were out together. Perhaps she thought the Professor required to be roused up a little, which he certainly did. The constrained manner towards her niece which I had at first observed in her had, moreover, to a great extent disappeared.

In the evenings, if Miss Selwyn were not out about the grounds or disturbing her uncle, she would generally sit and read to us while we sewed, occasionally stopping to make some light remark, which caused her aunt and me to smile ; or stand looking over me while I played and sang. She never sang herself ; she said she had no voice. Altogether, things were more lively since her arrival.

'What a pretty dress you have on !' said she one evening. 'What kind of material do you call it ? I never can remember the names of stuffs.'

'This is a grenadine,' I answered, a little aston-

ished. 'It is a present from your aunt. She is very kind to me.'

'Not more so than you deserve, I imagine. I have often thought you must feel it very dull—you so young and pretty—pardon me—to be shut up here. Have you any brothers or sisters, Naomi?'

'Only one brother, and he is very young; but I have four sisters—two older, and two younger than myself. Papa is a clergyman in one of the poorest of the London suburbs. His salary is not large enough for us all, and that is the reason I am here.'

'And your sisters, are they also in situations?' she asked.

'The two eldest are; the others are not old enough, and mamma requires one of them at home, for we keep only a very small servant.'

She did not ask more. I longed to inquire something about herself or her people, but did not like. In spite of her frankness, she could be very reticent when she chose, and she never alluded to her home in any way.

Although so fond of walking about the grounds, she had never yet been outside the gates, nor did she manifest any desire to see the village or go to the church on Sundays. I had tried to persuade her to accompany me the first Sunday, but she laughingly said she got quite enough of religion at home; and her aunt did not press her to go, but seemed rather relieved at her staying in. She, like the Professor, allowed her niece her own way almost in everything.

Our rooms were on the first landing. Miss Selwyn's was on the opposite side of the corridor from her uncle's and from Mrs Farquharson's, and looked to the back, as did mine also. Between her room and mine was a large room used for storing lumber. There was no balcony on this side, but only in the front. The servants slept above.

One morning I rose as usual before breakfast and went out into the garden. Miss Selwyn frequently joined me; but this morning she had apparently slept in. In my gardening operations I had slightly soiled my hands, and before going in to breakfast, went up-stairs to wash them and tidy myself generally. To gain my own room I had to pass the door of Miss Selwyn's, which I noticed to be ajar. In passing, I caught a glimpse of Miss Selwyn in her crimson morning gown standing before the toilet-table in her room, gazing into the looking-glass. In her hand she held what, to my astonishment, appeared to be a razor. She looked precisely like a person who had finished the operation of shaving, for I had seen papa look just like that. I was so surprised that I almost uttered an exclamation, but recovered myself, walked on, and gained my own room, shutting the door very softly.

It might be perhaps a day or two later. I retired to my room in the evening earlier than my wont, as I wished to finish a letter I was writing to mamma. My window was open half-way, for the evening was warm. My letter being finished, but not feeling inclined for sleep, I was sitting at the window gazing idly into the moonlight. Every one was up-stairs, and I believed myself to be the only one awake in the house. The Professor had gone to his room after tea, and nearly an hour before I had heard Mrs Farquharson and her niece bid each other good-

night as they entered their separate rooms. They seemed always to finish their conversation downstairs, for Miss Selwyn never sat and chatted with her aunt in her room after coming up, but went straight to her own. I would have liked an occasional cosy chat with her by our bedroom fires; but as she never invited me into her room, I did not venture to ask her into mine.

It was a lovely moonlight night. Our side of the house, however, lay completely in shadow. I do not know how long I may have sat, when I heard the window of Miss Selwyn's room softly raised. I knew it must be hers, because the room between us was, as I have said, used only for lumber, and Mrs Farquharson's and her brother's rooms were on the other side of the corridor, their windows looking to the front. 'She is like myself,' thought I; 'she cannot sleep either.'

I was about to call to her softly to let her know that I also was awake, when I heard her strike a match, as if about to relight her bedroom candle. Apparently the light went out again, for I heard her mutter something which sounded like an oath, and immediately after another match was struck. I had not known swearing was one of Miss Selwyn's accomplishments, although she was addicted to using slang phrases. A minute or two later, wafted to my nostrils came the aroma of a cigar. I glanced downwards, my first impression being that the pleasant odour came from below; but there all was silent. Again I felt it, and this time was certain it came from the open window of Miss Selwyn's room. Cautiously, I put out my head once more. Miss Selwyn, doubtless believing herself the only one awake, was leaning carelessly out of her bedroom window, her eyes fixed on the stars, calmly enjoying either a cigar or a cigarette. I had heard that to smoke cigarettes was common amongst some ladies, yet this discovery nevertheless came upon me with almost a shock. Fortunately, my room being also in darkness, Miss Selwyn did not seem to have seen me. She must have sat there for nearly half an hour before I heard her close her window. I was glad when she did so, for I could not go to bed leaving my window open, and she was certain to hear me if I attempted to close it. I wondered if Mrs Farquharson knew of this accomplishment of her lively niece.

My sleep that night was disturbed by restless dreams, in one of which I saw Miss Selwyn seated calmly on the seashore watching the waves come lapping in, and smoking a huge clay pipe, while in her hand she held a razor, which she had just been sharpening against the rock on which she sat.

It is curious, when once one's attention is drawn to any particular fact, how soon thereafter something is sure to occur in connection therewith. The next day Mrs Glass waylaid me in the hall, Mrs Farquharson and her niece being then engaged in correspondence. Miss Selwyn had only one correspondent, and his letters—her correspondent was of the male sex—did not appear to give her much pleasure. Mrs Glass drew me into her own private parlour and closed the door carefully. 'I have something which I wanted to tell you, Miss Stuart,' said she. 'It is about Miss Selwyn. May I ask what you think of the young lady, miss?'

I was taken somewhat by surprise at the question. 'What do you mean? Do you refer to her appearance, or her conduct generally?'

'I mean her ways.—Don't you think she is a very strange young lady? She has such free and easy ways. And do you know, miss, I do believe she smokes!'

Had she not been an elderly woman, I would have cut short the conversation by telling her that it was neither my business nor hers to discuss Miss Selwyn's conduct; but she had always been very kind to me, and I did not wish to say anything to hurt her feelings. I think she must have read my thoughts, for her next words were half apologetic.

'I know it is none of my business, miss; but something I heard two days ago from Jane the housemaid, and from my cousin Mrs Jenkyns, who keeps the inn, you know, miss, has made me wonder if I should not tell what I heard to Mrs Farquharson; so I thought I might safely tell you, and leave you to judge, for I think she has something troubling her already just now; she has not been quite herself since her niece arrived.'

I had noticed this fact, but had been inclined to ascribe it to imagination; but Mrs Glass had evidently observed it also.

'But what is your reason for thinking Miss Selwyn smokes? You have not seen her do so, I suppose?'

'No, miss; but I have often felt the smell of cigars in her room in the mornings, and have found pieces of cigar ends in the grate and on the ground outside her window. It is not a very lady-like thing; and Mrs Farquharson would be wild if she knew, I am sure.—The Professor, as you know, does not smoke, so the cigar ends could not be his.'

'And what did Jane tell you, and your cousin?'

I again inquired, not wishing to tell what I had myself observed overnight.

Mrs Glass came a little nearer and spoke in a lower tone. 'You must have noticed, Miss Stuart, that Miss Selwyn has always kept very close to the house ever since she came. She has never been outside the grounds, to my knowledge; and you remember the strange way in which she arrived when no one expected her. It is my opinion she is here in hiding, and does not wish to be seen. I think she has run away from home, miss.'

I was so taken aback by this view of the matter, that for a minute or two I could not say a word. 'What should make her leave her home?' I asked at length.

'I don't know, miss, of course; but perhaps a lover may have had something to do with it. You can judge, after you hear what I am going to tell you.—From anything ever I have heard, any of Mrs Farquharson's relatives are in poorer circumstances than herself, and Mrs Selwyn may have wished her daughter to marry some one she did not care for, for the sake of his money. I don't think Mrs Selwyn and Mrs Farquharson are particularly friendly, for they don't visit; and I did not know there was a Miss Selwyn till she arrived here that day.—Of course I only came here eighteen months ago, and did not know Mrs Farquharson till then. Well, two days ago, Jane went down to the village to

order some things for the house. When she arrived at the end of the avenue, she saw a man gazing curiously over the gate into the Manor grounds, but he turned away in the direction of the village before she came up to him. When she was passing him, he spoke to her, and walked along by her side till they reached the village. He was rather an elderly man, and looked like a well-to-do gentleman, she says, or she would not have answered him when he first spoke. He seemed much interested in this house, and asked her a great many questions; and although he tried not to let her see it, was evidently especially interested when she mentioned Miss Selwyn's being here—asking particularly as to when she came, what she was like, and how long she intended staying.—Jane got annoyed at his questions at last, and left him abruptly when she reached Mrs Ball's. On coming home, she at once told me, and described the man. I advised her not to say anything to the others. Yesterday afternoon, I called on my cousin Mrs Jenkyns to hear what she could tell me, for Jane had seen the gentleman enter the inn. He was not in then, but was staying there, and had been doing so for a week past. He had also questioned my cousin as to the Manor-house, and had expressed a great desire to see it. My cousin told him it was not open for visitors to see through it. Fortunately, although she noticed his curiosity with regard to Miss Selwyn, she could tell him nothing about her; but she thought he might be an elderly lover of that young lady; and putting things together, I have come to the same conclusion.—What do you think of it, miss?'

'I cannot tell,' I answered, perplexed. 'He may be of a naturally inquisitive turn, as elderly gentlemen sometimes are, and may be asking these questions without any particular motive; and the Manor-house is certainly an interesting feature in the surroundings.—But stay. What is the man like? Is he short and stout, wearing a soft hat and light drab overcoat? I met such a man between the Manor and the village the other day; and now that I think of it, he did look at me rather curiously.'

'That is the very man, miss; but sometimes he wears a short blue jacket. I'm sure I do not know whether to tell Mrs Farquharson or not.'

'Better let things alone meantime. We have no evidence that the man is really in any way connected with Miss Selwyn, although I admit his questioning looks suspicious; and even though he does know her, it does not follow he is a lover of hers. She certainly did arrive here rather unexpectedly; but the account she herself gave on arrival was quite satisfactory to me at anyrate; and we must not jump to the conclusion that she has run away, unless we see some stronger reason than we have at present. Besides, even though he should be her lover, he can scarcely run away with her unless she is willing; and if ever there was a young lady perfectly capable of taking care of herself, I should think Miss Selwyn is that one.—I have to go to Shuttleton myself this afternoon, and will call on Mrs Jenkyns and ascertain if he is still there.'

She left me then; and I proceeded to take

my constitutional. Almost mechanically, my steps turned into the avenue leading to the village. The avenue took rather a sharp curve about two hundred yards from the gate, and near this gate there was a mass of shrubbery. Nearer to the Manor the grounds were very open, and the windings of the avenue alone hid the house from view. I was approaching this turn in the avenue, when I heard a sound as of a footstep. Not wishing to be seen, as I had still on my morning gown, I glided behind a large tree, and took shelter at the back of a spreading rhododendron bush which stood near. In another minute, whoever it was turned round the curve and then paused. I ventured to steal a glance from my hiding-place. Through the trees I saw him: it was the man of whom Mrs Glass had spoken—the supposed elderly lover of Mrs Farquharson's niece. He had his back to me, for I was on the side of the avenue farthest from the Manor, and he was gazing earnestly in its direction. He appeared as if afraid of being seen, as he kept glancing suspiciously around. He did not wait long, fortunately, for, after satisfying himself that no one was in sight, he turned and walked back the way he had come. I waited till he had gone, then hurried home as fast as my feet could carry me. Surely, after all, the man was here with some object; but that object might not be Miss Selwyn. A suspicion that he might be in league with a gang of thieves, though housebreaking was a thing unheard of amongst us, haunted me all the forenoon. He might wish to reconnoitre before making the attempt. Mrs Farquharson kept no man-servants, and there were many valuable articles in the house. What made matters worse, the Professor had that morning early left for town to visit a brother Professor who was at present laid up, and we did not expect him back till the next evening. I was, however, destined ere long to have the man's conduct explained, for that very afternoon I unexpectedly obtained light upon it.

ONE MORE CHEMICAL TRIUMPH.

To chemistry perhaps almost more than to any other science we of the present day are most deeply indebted. Through it we have become acquainted with the properties of the various elements which enter into the composition of this world of ours, and by studying their different actions upon each other the chemist has succeeded in producing those numerous artificial compounds which are daily used so extensively in the arts, and the manufacture of which contributes so largely to a nation's industry. By his skill, 'waste' substances have been converted into valuable matter; new occupations have consequently sprung into existence, and one result of all his labours therefore is, that to-day thousands of persons are earning their livelihood at trades which it was impossible for them to follow a few years ago, because such trades were then unknown. But the creation of these industries, though playing so important a part in the world's commercial history, cannot be regarded as being altogether an

unmixed blessing from a hygienic point of view; for wherever extensive chemical works are situated, the streams become more or less polluted with the waste products, and the air is charged with effluvia that are far from healthful.

The nuisances to which reference has just been made are perhaps more perceptible in connection with the alkali trade than with any other manufacture; and they have existed ever since Leblanc's method superseded the old-fashioned process of obtaining carbonate of soda from barilla—more than sixty years. By adopting what is known as the 'ammonia-soda' system—a comparatively recent invention—the foul odour is obviated; but since in this country one firm possesses a monopoly of the method, Leblanc's process has continued to be employed. Shortly stated, it consists in converting, by three principal operations, common salt into carbonate of soda. Chalk (carbonate of calcium) and sulphuric acid are among the agents used to effect such conversion, and in the course of the numerous chemical changes which take place, they react upon each other, and form sulphide of calcium, which, together with other impurities that come into existence during the process, is thrown aside, the mixed mass being known as 'alkali-waste' or 'soda-waste.' When brought into contact with an acid, sulphide of calcium is decomposed, with the evolution of sulphuretted hydrogen, a gas possessing a most offensive smell. Now the rain which falls in manufacturing towns is always highly acid, and consequently, when it becomes mixed with the huge mounds of alkali-waste which abound at such places as St Helens, in Lancashire, the sulphide of calcium is decomposed, and the atmosphere is filled with the odour of rotten eggs, whilst the drainage from the heaps causes any stream in the neighbourhood to smell most foully.

Enough has been said to show what a serious nuisance and detriment to health the alkali industry must be to those who are compelled to reside in the vicinity where it is carried on; and of late years, efforts have been made to remedy the evil by recovering from the waste the sulphur which is contained in the sulphide of calcium; but none of the methods proposed have come into practical use. To Mr Alexander Chance, of the well-known firm of Chance Brothers & Co., of Birmingham, there is, however, now no reason to doubt that sanitarians will be deeply indebted, as not only has he devised a process which removes the long-standing nuisance, but it at the same time affords considerable advantages from a commercial point of view; and the method is so simple that one is led to wonder how chemists can possibly have overlooked it for so many years. Perhaps 'happy idea' would be a better term to employ in connection with it than the word 'process,' seeing that it is based on facts well known to the most elementary student of chemistry. Among the many by-products, useful and otherwise, which are obtained during the manufacture of alkalis is carbonic anhydride, commonly called carbonic acid; and it is by means of this gas that Mr Chance annihilates the great nuisance now caused by alkali works. He saturates the waste with the hitherto useless carbonic anhydride, which acts on the sulphide of calcium

and causes sulphuretted hydrogen to be evolved. By burning this gas the sulphur it contains is converted into sulphurous anhydride. Now the formation of sulphurous anhydride is one of the first steps in the manufacture of sulphuric acid, and therefore the former when obtained *à la* Chance can be transformed into the latter by the ordinary method; so that the sulphuric acid employed in the first stage of the manufacture of carbonate of soda, and which has undergone so many changes, is recovered and can be again used for the same purpose as before, after which it can be once more obtained in its original state, and again pass through the processes to which it has been previously subjected; and so *ad infinitum*.

But economical as this must be to the alkali manufacturer, and beneficial as it must undoubtedly prove to those residing in the neighbourhood of alkali works, the new system of dealing with soda-waste affords another pecuniary advantage which will not be lost sight of. It is this: if, instead of igniting the sulphuretted hydrogen evolved from alkali-waste by Chance's process, it is subjected to the method devised by Mr C. F. Claus for obtaining the sulphur from sulphuretted hydrogen, and which is now adopted for this purpose at several chemical works where the foul-smelling gas is emitted, we get in its purest form the sulphur which was in combination in the pyrites used in the manufacture of the sulphuric acid employed in converting common salt into carbonate of soda, and which can either be again utilised for making oil of vitriol, or can be sent into the market to be devoted to those numerous purposes to which sulphur is applicable.

The commercial importance of the new method of dealing with soda-waste will readily be understood when it is stated that the quantity of sulphuric acid annually used in Great Britain in the alkali manufacture is something like one hundred thousand tons, and this has hitherto been thrown away in the shape of sulphide of calcium, which, as we have already shown, soon becomes an intolerable nuisance to the neighbourhood. By the new process all this will be changed; for not only can the sulphur be obtained at a very slight cost from the obnoxious sulphuretted hydrogen, but the latter can be converted into sulphuric acid at a comparatively inexpensive rate, and therefore little of the enormous quantity of pyrites now consumed in the manufacture of oil of vitriol will be required. Consequently, not only will a saving be effected in the cost of pyrites, but from the sulphur yielded by the alkali-waste, a handsome profit will be derived, as in the market it will sell at from three to six times the value of the pyrites. There is also the advantage from a health point of view that, after the waste has been subjected to the new treatment, it is perfectly innocuous, and may be deposited anywhere without becoming a nuisance or deleterious to health.

This latest outcome of chemistry is simply one more proof—and we have had many within recent years—that nothing is really 'waste,' and that substances we have regarded as useless turn out to be of the greatest value when we find the proper method of dealing with them. At Mr Chance's happy idea, all who are interested in the commercial welfare of the country must rejoice;

whilst those who look upon it simply in a sanitary light cannot fail to be well pleased that the long-standing alkali-waste nuisance will now be at an end.

THE PLEASURES OF FISHING.

BY AN UNSUCCESSFUL ANGLER.

'A SPLENDID day, Jones!' says Bilston (I am Bilston's guest), as I bid him good-morning. 'A perfect day; we couldn't have a better one.'

When I awoke that morning, I had observed with a feeling akin to relief that the Yorkshire landscape was shrouded in mist, and that the Yorkshire roads were canals of mud from the drizzling rain, which had been falling steadily all night and was still coming down from a dull murky sky. 'That precious fishing expedition is knocked on the head,' was my sleepy comment as I turned over for another nap before getting up; and really I never supposed that any sane man would think of going outside his own door if he could help it in such weather. And now Bilston tells me it is a perfect day and couldn't be improved upon! I'm glad some one is pleased, but fear that I echo Bilston's eulogy with faint fervour.

'You're late, Jones,' he continues in tones of cheery reproach. 'We've nearly finished breakfast, and the parson will be here with the trap in five minutes.'

'I hardly thought you would go to-day,' I reply, rather shamefacedly.

'Not go!' shrieks Bilston. 'My dear man, I wouldn't stay at home on a day like this for fifty pounds.'

A very modest consideration indeed would buy me off; but I am at Bilston's mercy. 'A day's fishing' was one of the attractions held out for my visit, and I can't very well back out of it now; I can only hope that the parson, who has undertaken to drive us out, will have more sense than to come.

'Here's Middleby,' says Bilston, rising from the table and going to the window.

The Rev. Mr Middleby looks moist, but jubilant. 'What a glorious day!' he says. 'Are you ready?'

We are not quite ready, so the parson comes into the dining-room and spends ten minutes comparing notes with Bilston on the respective merits of 'blue duns' and 'red roans' in such weather as this. He is a capital specimen of the country curate; a jovial, active man, who gives one the idea that he goes heart and soul into everything he takes in hand. 'I'll fix you up,' he says to me, when I mildly suggest that I haven't fished for some years, and, like Mr Winkle at skating, am rather out of practice. 'You'll get on capitally.—Worm? Nonsense; that's poor sport. I'll set you going properly.' He has got such a powerfully persuasive way with him, that I'm afraid he will.

'Did you bring any lunch?' asks Bilston.

The parson knits his brows and thinks; evidently, he has not thought of such a detail when trout-fishing is the business of the day. 'I've got three pork pies,' he says slowly, 'and a cold fowl; and half-a-dozen hard boiled eggs, and a good lot of sandwiches.—You said you'd bring your own lunch,' he adds apologetically, as though his little

store was intended to meet the wants of one slender appetite.

'Oh, we are all right,' says Bilston. 'My fishing-basket is full.'

This I find is literally true; Bilston's basket, moreover, is by no means a small one.

'When do you expect to be back?' I ask, as a dim vision of damp beds in a country inn flits before my mind's eye. The preparations are on such an extensive scale that I begin to feel anxious.

'We'll be home in time for dinner,' says the parson, holding up his flask to the light; 'but it's just as well to take a little with us.'

What noble appetites they have in Yorkshire!

'Are you making a long stay down here?' he asks as I climb into the dogcart beside him.

'Only a few days,' I reply, turning up my coat-collar.

'Then you *are* in luck.—I may safely say that you might stay here a month without getting such another day as this.' He closes one eye, and says this in an impressive undertone, befitting the importance of the revelation, and then draws back his head to watch the effect it has upon me. I am unresponsive, and the parson relapses into puzzled silence. He can't understand my feelings any more than I can appreciate his. I am very subject to cold, and my wife would be in a nice frame of mind if she knew what I was doing. We have eight miles to drive before we reach the stream; it does not look very formidable, though it is swollen by the rain to-day.

'Is there much wading to do?' I ask carelessly.

'Oh no,' says the parson. 'You need seldom go in as high as your knees.'

If the Rev. Mr Middleby or any one else catches me immersed as far as my ankles, I shall be very much surprised.

We have left the trap at a roadside inn, and are standing on the bank getting our rods ready; or, to be strictly accurate, I am watching the parson's deft fingers lash wild-looking flies on to invisible gut with fearful and wonderful knots. I have been forced to consent to use flies; he won't hear of my fishing with a worm. It's awfully unsportsmanlike, he says, so I give in.

Bilston has started to walk up the road for a mile or two to a point whence he will fish down to us.

'There you are now!' says the parson. 'You'll find a capital run a couple of hundred yards up; go and try a cast there, but mind the trees.'

I'm by no means sure that I know what a 'run' is, but take the rod from the parson's hand and start for my destination without acknowledging my ignorance. I daresay I shall know it by the trees I have been warned against; there are not many on the bank.

I make a very good commencement, and succeed in throwing the cast without catching the overhanging boughs. Now it is fairly in the water, I'll leave it there; I can't get into difficulties if I don't attempt too much. In the distance I can see the parson making throw after throw with the restless perseverance of an automaton. I conclude that is the proper way to fish with flies; but there aren't any trees near him to interfere with his line. I did not think the flies looked particularly lifelike when I began, and evidently the trout

don't think so either, for I have not even had a bite when the parson leaves his station and passes me on his way up-stream. I feel bound to make another cast as he stops to watch me.

'Your tackle is all mixed up,' he says, as I make a graceful sweep with my rod.

'Ah, so it is; thank you. Didn't notice it; a little short-sighted,' I reply disjointedly, and lay the rod down on the stones to clear the cast, which, now I come to look at it, has twisted itself into a collection of Gordian knots with a degree of talent I did not imagine two yards of gut possessed. I can't manage to unravel it completely, but get it into some sort of order, quite good enough to satisfy myself.

Bother the trees! Between the wind and the ridiculous flippancy of the rod, I have 'hung myself up' (I understand this to be the correct expression). I can't tug the line down; and after a few trials, resign myself to a scramble up the wet slippery trunk. I cut away enough small branches to furnish a moderate-sized garden with pea-sticks, and as the last one falls, taking the cast with it, my new fishing-knife drops neatly into a black-looking pool below the roots of the tree. I use an expletive, and descend. It takes a good quarter of an hour to disengage the line from the twigs, and by that time the parson is well out of sight. Whatever mistake I may fall into next, I won't fish near trees, and choose a nice clear piece of water with no obstructions about it.

How on earth any fellow can throw a fly in the face of this wind, I do not know; I can't get mine into the water at all except by the most unscientific and violent thrashing. There! I knew that would happen; I'd have bet any money on it. The tail-fly has caught in my coat between the shoulders: I can't reach it; I can't pull it out; and it doesn't take me long to discover that I can't break the gut. I daresay a stout man pawing feebly at his own back to release his fishing-tackle makes a very humorous picture. But that doesn't reconcile me to the situation when a labourer with a face like a cod-fish stops to grin, and by-and-by laughs outright. (How awfully rude the lower classes are in Yorkshire!)

'Whoy doan't thee tak off thoi cowut, maan?' he says with contemptuous pity.

Happy thought! Why didn't it occur to me before? I strip off my 'cowut,' and lay it on the grass; the hook is well in over the barb, and I can't withdraw it.

The labourer, who seems quite unnecessarily amused, comes to the rescue again. 'Hast noa gotten a knoife?' he asks.

I've lost mine, and tell him so—not how; and suffer him to operate on the cloth with an instrument like a small carver. Clear again at last. My friend in need has gone on his way, having accepted a shilling for his services in cutting a large hole in my coat, which breathes a very perceptible odour of strong cheese.

I set to work again, and fish diligently for an hour without doing anything worthy of note. I may be wanting in science, but in patience I yield to no man, and I have always been taught that this virtue is the attribute most valuable to the fisherman. My toil is rewarded at last: a beautiful trout, nearly five inches long, takes one of the flies—I don't know which—and with a tremen-

dous effort I swirl him out of the water, over my head, into a patch of furze bushes. It is a little difficult to find him, for the hook came out as soon as he fell. I shan't abandon the search in a hurry. If a bird in the hand is worth two in the bush, a trout in the furze is worth two in the stream, and I hunt carefully, regardless of prickles until I find him. I wonder what he weighs, he can't be very heavy; but Bilston has brought his spring balance, so the fish can stay in my basket until I can weigh him at lunch-time. If it wasn't for the wind, I should get on capitally; but success has made me incautious, and before long a fly catches me somewhere again, not in my coat this time. Really, it is very awkward, a most embarrassing position if any one should happen to come this way. The hook has a frightfully sharp point, and tells me its exact locality if I make the slightest movement. What *am* I to do? It's all very well to take off one's coat in full sight of the public highway; but there's no knowing how long it may take to get the hook out without a knife, and I can't divest myself of this garment for an indefinite time; it's out of the question. Bother it all! here's somebody coming. I won't be caught in this predicament; and wet as the grass is, I sit down, and pretend to examine my reel.

'Any sport?' asks the stranger.

'Not much,' I reply, as serenely as can be expected of a man impaled on a fish-hook.

'Too cold?' he suggests after a very long pause. He hasn't much to say, but takes a very long time to say it, and is exasperatingly slow about moving off. He is out of sight at last, and I secure a couple of large stones to break the gut with. I bruise my fingers, lose my temper, and make awful havoc of the tackle before I get free, but it is done eventually, and I apply myself to piecing the fragments together again. It doesn't look quite right, somehow, when I have completed the repairs. The top fly is only six inches from the silk line, and the next one hangs about a foot below that; thereafter is a four-foot strand of plain gut, unencumbered by hooks, for the other fly clings unlovingly to my trousers.

The rain has passed off, and the sun is growing hot. Bilston said he was afraid the drizzle would not last all day. I can't say I regret it, though the change seems unfavourable to fishing, for another hour's assiduous work is unproductive of results. I must say I get on better without that tail-fly; there's nothing to catch in the trees and check one's freedom of action in making casts. It is past one o'clock; I shall stop and walk up to meet Bilston and the lunch. I go a good mile and a half before I desery him seated in the shade on the other side of the river, beside the parson, both of them busy with knives and flasks.

'Hillo, Jones!' shouts Bilston. 'Come along. You'll find a safe place to cross if you go fifty yards higher up, just round that bend.'

The place doesn't look very safe when I reach it, and nothing but hunger would urge me to try a crossing. As I have hinted before, I am a stout man, and start on a series of perilous leaps from rock to rock, with my heart in my mouth. I'm half-way over, and the widest leap has to be taken; the rock I'm standing on is awfully slippery, and the water looks unpleasantly deep. I screw up my courage and jump—into the brown stream nearly up to the waist! I don't want the friendly

help of the stepping-stones now, and drag myself to the bank, which I gain with my boots full of water, and the horribly uncomfortable feeling a man has after taking a bath in his clothes. What humbug it is to call this fishing business an amusement! Disgusting!

The parson has finished his lunch and is counting the basket when I arrive. 'Undersized,' he says severely to Bilston, holding up a fish much larger than the one in my basket. 'I thought you knew that the limit on this water is eight inches.'

Bilston asks if it isn't eight inches long, with the uneasily innocent air of a man pretending that he thinks he has done no wrong.

'A short seven,' says the parson, throwing the trout back into the water.—'I ought to have told you there's a penalty of two guineas for taking undersized fish, Mr Jones,' he adds, turning to me: 'the keepers are very stringent about it too, and quite rightly.'

I wish I had left my capture in the furze-bush, and register a vow to throw it away as soon as I can without being seen. I'm no judge of length, but if the trout in my basket is five inches long, I shall be astonished.

'You haven't spared yourself, old man,' says Bilston, surveying my wet clothes; 'but it was hardly worth while wading so far as that.'

Shall I tell him that I tumbled in, or let him suppose that I've been standing in the water almost up to my middle all day, in my zeal for sport? Looks well to have been working hard, though I have nothing to show for it.

'I hadn't much luck,' I say, throwing down my rod; 'the only one I got was a small one.'

The parson glares hard at my tackle, and then gets up to inspect it. 'Not surprising, if you've been fishing with this,' he remarks dryly.

'I lost the other fly,' I falter, turning to receive a packet of sandwiches from Bilston. I feel that the parson's searching eyes are upon me, and don't feel at all happy.

'Shall I take this off for you?' he says, taking the gut of that tenacious 'tail-fly' in his fingers and giving it a gentle pull.

'Funny way to *lose* a fly,' says Bilston gravely, as he sees what the Rev. Mr Middleby is doing.

I am bad at fibbing—notoriously unsuccessful with what people call the 'ready lie'; but it did occur to me as soon as I had spoken that it would have been as well not to have said that I didn't know it was there.

Bilston echoes, 'Didn't know it was there!' and breaks into a vulgarly loud roar of laughter. I stand looking foolish whilst the parson cuts out the hook in stern silence. He is an enthusiast himself, and doesn't seem pleased.

'If your friend doesn't care about fishing, perhaps we had better go home,' he says to Bilston.

'Oh! but he does,' says my host, choking down his risibility with an effort.—'Don't you, Jones?'

Regardless of the most elementary principles of truth, I solemnly aver that I know no sport like it (I hope I never shall), and that trout-fishing is a passion of mine. I attack the lunch, and Mr Middleby, who is as good-natured as he is earnest, sets to work to readjust my tackle, whilst Bilston leans against a tree, smoking, with his hat resting on his eyebrows.

'Here's the head-keeper,' says the parson in an undertone; 'it's lucky I threw away that little one you had.'

Bilston nods seriously, and having a clear conscience, gives the keeper a hearty 'good-day.'

'Day, gen'lemen,' says the keeper pleasantly. 'Any sport to-day, gen'lemen?'

This is awful! My companions promptly respond to the question by turning out their baskets on the grass. It is evidently a civil way of asking to examine the catch. He doesn't seem to notice me as I sit in the background with my basket behind me. I certainly won't volunteer to display its contents; my fish would be worth its weight in gold to him, very nearly.

The keeper turns over the little heap of trout with his stick. 'All right, Mr Bilson, sir.—A awful hot day, sir.'

A brilliant idea strikes me: I will make friends with the keeper. Perhaps he may put me up to a wrinkle or two by which I may redeem my character in the parson's eyes, if I have to go on with this wretched fishing business all the afternoon. I'll offer the keeper a drink: that's what he's hinting at.

'Have a nip of whisky, keeper?' I say with condescending affability, pulling round my basket in momentary obliviousness of the solitary companion my flask has therein.

'Thank 'ee, sir; much obliged.—Teetot'ler, sir,' says the man in velvet. 'Ope you 'ave 'ad some sport, too, sir?'

Oh, why didn't I hold my tongue? Why did I go and offer him a drink he didn't want? He comes over to my side as I try to shuffle the basket out of sight, pretending I didn't hear him, and coolly kneels down at my side in readiness to examine the dozens of fish his manner seems to indicate he is sure I have caught.

It is no use denying it; he mightn't believe me, and that would complicate matters. I pull the basket round again, and he opens it wide whilst I stare blankly at the top of his weather-beaten hat. It takes him fully half a minute to search that basket; and I'm beginning to hope that the fish may have tumbled out when I fell into the stream, but presently he emits a low chuckle, and draws out the now stiff and unwholesome-looking victim of my skill. He sits back on his heels, looking from it to me and from me to it again. My condescending affability is all gone. I hope I don't look so foolishly small as I feel. The keeper shakes his head solemnly, and coughs.

'This 'ere fish is hunder size, sir,' he observes at length.

'I didn't know how the'—

'The fine for takin' hunder-size fish is two guineas, sir,' he continues without noticing my interruption. 'Is lordship likewise gives 'arf the fine to us if we catches gen'lemen takin' such trout, sir;' and the hardened ruffian smiles softly as he turns the sorry object about in his hands.

'What does this mean?' I demand savagely of the parson.

'The keeper is quite right,' says the Rev. Mr Middleby. 'If you make a row about it, he'll just report the matter, and our leave to fish here will be withdrawn.'

'I oughter report it,' says the keeper doubtfully as he gets on his feet.

For myself, I shouldn't much care if he did, but I can't get Bilston into trouble, and deprive him of the 'amusement' he takes such unaccountable delight in. I swallow my wrath and look hard at the keeper; he must be a thought-reader, for he smiles again, knowingly this time.

'Don't report anything about it; I'll settle with you,' I say, and in desperation I force a sovereign into his hand. He doesn't look quite satisfied; so now, quite reckless, I add three half-crowns. That soothes the keeper's conscience.

'You may 'ave the fish, sir, if you wishes; it's dead,' he says, politely tendering it by the tail. (What tactless people one does meet at times!) I snatch the nasty thing from his hand and throw it into the river with a snort of rage. The keeper touches his hat and retires. Bilston, who has been grinning like a Cheshire cat all the time, composes his features. Heartless fellow that Bilston! I don't see anything funny about it. One pound seven shillings and sixpence for that—that reptile I have just thrown away; not counting that other shilling I paid the labourer this morning. I suppose I look as if I was going to use bad language, for the parson gets up hurriedly and goes to the river-bank out of hearing.

'A very expensive trout that,' says Bilston gravely.

But I am too angry to reply, too thoroughly annoyed even to tell him that if ever I want a fish of any kind or size again I will buy it in a civilised fashion.

N.B.—I have given away my rod.

WATERCRESS.

WITH the drawled-out cry of 'Watercreases, fine watercreases,' which is heard daily in the streets of our English towns, every one is familiar; and with the plant itself the majority of people are acquainted, for it is among the more generally distributed of our aquatic vegetable products, and its warm agreeable flavour has long caused it to be one of the most popular, whilst it is at the same time one of the most wholesome of table relishes. Botanically, it is known under the name of *Nasturtium officinale*, and it belongs to the natural order *Cruciferae*, all plants of which have their petals, or flower-leaves (four in number), arranged in the form of a cross. The characteristic of this order, to which the cabbage, cauliflower, and most of our culinary vegetables belong, is, that the bulk of its members possess antiscorbutic and pungent properties, and it does not contain a single plant which is poisonous. If, therefore, at any time in doubt as to whether a particular vegetable growth is edible or not, the obtaining of a flower will tend greatly to solve the problem; for if the bloom be composed of four leaves arranged in a cross-like form, and has six stamens, four of which are long and two short, it will be quite safe to use the plant as food, although the presence of more or fewer than four flower-leaves must not be invariably taken as indicating that a plant is non-eatable. When we say that a quartet of petals denotes that the vegetable bearing them may be eaten, it must not be interpreted as inferring that all such vegetables will be palatable; we simply wish to convey that they may be partaken of without serious results following.

Though watercress is a native of this country,

growing freely in rivulets and ditches, the greater portion of that which finds its way into the market is cultivated, immense quantities being grown for this purpose in Kent, Bedfordshire, Essex, Hertfordshire, and other places. Its cultivation in Europe appears to have been begun about the middle of the sixteenth century at Erfurt, in Germany. But it was not until 1808 that its growing was undertaken in this country. In that year a market-gardener named Bradbury, of Springhead, near Gravesend, observed that the watercress of that place was of a finer quality than that produced elsewhere; and perceiving that when kept free from weeds, &c., it thrived well, he took to farming it for the market. Since then, it has become an object of regular cultivation, and large beds have been planted in various parts of the country. A few of the growers have become prosperous men; and to-day large numbers live by its culture, whilst many more daily earn their livelihood by its sale. In London alone it is computed that the street hawkers annually dispose of something like ten thousand pounds' worth of watercress; and the greengrocers of that city are credited with selling each year five thousand pounds' worth of the same plant. When, therefore, we come to consider the quantities which, in addition to the metropolis, must be consumed in Manchester, Birmingham, Liverpool, and other large centres of industry, we get some idea of the enormous sum annually spent on this relish. On the Continent it is also much esteemed, as may be gathered from the fact that the yearly rental of the beds at Erfurt reaches ten thousand pounds; and in Paris, *octroi* duties are annually levied on watercress, estimated to be worth forty thousand pounds. In New Zealand, whither it was imported by English settlers, it grows exceedingly well, the leaves attaining an extraordinary size; in fact, it is said to have become a somewhat troublesome weed. In India, according to Mr Main, it is cultivated under sheds erected for the purpose.

As is the case with most other plants, the cultivated watercress is of better quality than the wild; and besides this, there is the more important consideration, from a grower's point of view, that the cost of rearing the plant at will is less than that of searching for it under the difficulties which attend its spontaneous production. The method of cultivation is this: a clayey soil is selected, and in this beds of about a foot in depth are made. Each bed has a slight inclination from one end to the other, and into it a small stream of water is caused to flow. The bottom of the bed can either be made of a sandy or gravelly nature, or allowed to remain in its natural state, though the former is the better proceeding. At the bottom of the beds the watercress is planted in rows, in the direction of the current, at about six inches apart. Dams of half a foot in depth are made across each bed, their number and frequency being regulated by the length of the bed and its degree of inclination, in such a manner that when the dams are full, the water will rise at least three inches over the plants in each compartment. The water is thus caused to circulate throughout, and if it be not absorbed by the soil, a stream no larger than will fill a pipe of one-inch bore will be sufficient to irrigate an eighth of an acre of beds. If plants cultivated in this manner are not allowed

to flower, they will furnish an abundant supply of young tops for the market throughout the spring, summer, and autumn. All that is required for their successful growth is occasional replanting and keeping the beds free from mud and weeds.

As an article of food, watercress forms a wholesome adjunct to our dietary, by acting as a stimulant to the digestive organs. It is said to contain iodine, and on this account it has been recommended by the medical faculty as a remedial agent in cachectic affections, and in some instances it is said to have proved highly beneficial.

Occasionally we hear of persons being poisoned by mistaking some other aquatic plant for watercress. The only thing with which it can be confounded is the water-parsnip, a common inhabitant of rivulets, ditches, &c., and one which frequently grows in company with the wild cresses. But the two are very easily distinguished from each other. The leaflets of the watercress are smooth and shining, and are entire at their edges; whilst those of the parsnip, which is poisonous, are serrated or notched. When the flowering stems are up, they also serve as a mark of distinction, inasmuch as those of the watercress are in the form of a spike, and those of the water-parsnip are an umbel. Moreover, the flower of the former is composed of four petals, that of the latter has five. If the plants are bearing seed, there is an obvious distinction in the fact that the seeds of the parsnip are enclosed in capsules, those of the watercress in pods. It is clear, therefore, that with ordinary care, the two plants need not be confounded at any season.

FORGET ME NOT.

FORGET me not when, far away,
You wander at the close of day
'Mid other roses, not more fair
Than those whose beauty was not less,
Because they saw your loveliness,
And blushed to see a sight so rare.

Forget me not, when others deem
All happiness an idle dream,
Save when they watch the sunbeams play
In golden tents of silken hair,
As though they loved to linger there,
Who perish with the dying day.

Forget me not, when other eyes
Are careless if the sun arise—
So only they may rest on you;
When others hold the songs of birds
Less sweet than those soft-whispered words
That I so loved to listen to.

And oh, if sorrow yours should be—
For even our dearest are not free
From pain we'd gladly bear instead—
If you should find a friend untrue,
One heart will still be true to you,
Till all its lovelorn days are sped.

JUAN FERNANDEZ.

JUAN FERNANDEZ, of *Robinson Crusoe* celebrity, is a small island in the South Pacific, some four or five hundred miles west of Valparaiso. Besides the name by which it is more usually known, it is also called Mas-à-Tierra (nearer-the-mainland), to distinguish it from another island nearly a hundred miles farther west, and hence bearing the name of Mas-à-Fuera (farther-off-shore). It has one anchorage, Cumberland Bay, and there, facing the sea, is the settlement, consisting of a few huts and a ruined fort. The island appears to be of volcanic origin; and the huge masses of rock piled one upon the other, rising to a height of nearly three thousand feet, present a very picturesque appearance from the sea. Gentler attractions are, however, not wanting; there are at least two valleys rich in vegetation, and smiling with the luxuriance of an almost tropical fertility.

One of these valleys is thus described by an American traveller—Mr J. R. Browne (*Crusoe's Island*): 'Nothing was here of that stern and inhospitable character that marked the rockbound shores of the island. A soft haze hung over the valley; a happy quiet reigned in the perfumed air; the breath of heaven touched gently the flowers that bloomed upon the sod; all was fresh and fair and full of romantic beauty. Yet there was life in the repose; abundance within the maze of heights that encircled the dreamy solitudes. Fields of wild oats waved with changing colours on the hillsides, green meadows swept around the bases of the mountains; rich and fragrant shrubs bloomed wherever we looked; fair flowers and running vines hung over the brows of the rocks, crowning them as with a garland; and springs burst out from the cool earth, and fell in white mist down into the groves of myrtle below, and were lost in the shade. Nowhere was there a trace of man's intrusion. Wild horses snuffing the breezes, dashed out into the valley in all the joyousness of their freedom, flinging back their manes and tossing their heads proudly;

and when they beheld us, they started suddenly and fled up the mountains beyond. Herds of goats ran along the rugged declivities below us, looking scarcely bigger than rabbits; and birds of bright and beautiful plumage flew close around our heads and lit upon the trees. It was a fair scene, untouched by profaning hands; fair and solitary, and lovely in its solitude as the Happy Valley of Rasselas.'

The chief interest of Juan Fernandez lies, however, not in its external features, but in its eventful history, and in the legends which have gathered round its name. That name is derived from a hardy Spanish sailor who discovered it about the year 1563, and promptly obtained a grant of his 'find' from the Spanish government. Here, like his more famous successor Selkirk, he lived for a time 'monarch of all he surveyed;' but soon growing weary of the lonely eminence, he abandoned his kingdom, leaving behind him as a gift to posterity a herd of goats and pigs.

When next the curtain lifts, the island appears as the shelter of the bold buccaneers. It lay conveniently near to the Spanish settlements, for on Spain the buccaneers made war with savage ferocity. Those were the heroic days of filibustering—the days of Lolonnois the cruel, Montbars the exterminator, Sir Henry Morgan—pirate and knight—Sharpe, and Dampier. It was after an unsuccessful attempt to surprise La Serena that Sharpe and his men anchored off Juan Fernandez. The shore was so thickly covered with seals that they were obliged to shoot some before they could land. The goats, too, had evidently multiplied, for the sailors signalised Christmas day by shooting sixty. As for the pigs, besides those slaughtered for present needs, a hundred were salted down. The waters were alive with fish, so that a sailor fishing with a bare hook caught in an hour or two enough for all the crew. There was an abundant supply of timber, palms, sandalwood, and wild quince, the greater part of which has long since disappeared.

In October 1704 the *Cinque Ports* galley, one

of Dampier's squadron, called at Juan Fernandez. There was a quarrel between Captain Straddling and his sailing-master, Alexander Selcraig or Selkirk, a native of the little fishing town of Largo, in Fifeshire, who refused to serve longer with his captain, and asked to be put on shore. When, however, his wish had been complied with, and he was left alone on the beach with some scanty stores, his heart misgave him, and he sought earnestly permission to return once more on board. But the brutal commander only made this change of resolution a subject of mockery, and left him to the charms of solitude. These, Selkirk 'enjoyed' for nearly four years and a half, till he was taken off (February 1709) by Captain Wood Rogers of the *Duke* privateer. Selkirk was appointed mate of the *Duke*; and died (1723) lieutenant of the royal ship *Weymouth*. A monument was erected to his memory in his native place in 1885. Two circumstances have conspired to confer on this young Scotchman a kind of immortality: Cowper made him the mouthpiece for a charming poem; and a plausible popular error identified him with the hero of Defoe's immortal tale.

There must have been something peculiarly seductive in the attractions of Juan Fernandez, for the next visitor, Captain Clipperton of the *Success*, lost four of his men, who deserted, though two were captured before the vessel left; while Captain Shelvocke, who lost his vessel, the *Speedwell*, and had to build another out of the wreckage, suffered a more serious loss, eleven sailors and thirteen Indians and blacks refusing to leave the island. 'They were not yet prepared for the other world,' was their excuse. Two years afterwards, no traces could be found of the rebellious twenty-four.

Here, in 1741, came the shattered remnants of Anson's expedition. With half his crew gone, and the survivors in such evil case that out of the two hundred there were hardly enough available for active work to sail the ship, the anchorage of Cumberland Bay was a welcome sight. The memory of the hardships they had undergone may to some extent account for the glowing language in which the historian of the expedition speaks of Juan Fernandez. 'Those only,' he says, 'who have endured a long series of thirst, and who can readily recall the desire and agitation which the ideas alone of springs and brooks have at that time raised in them, can judge of the emotion with which we eyed a large cascade of the most transparent water, which poured itself from a rock, near one hundred feet high, into the sea at a small distance from the ship. Even those amongst the diseased who were not in the very last stages of the distemper, though they had been long confined to their hammocks, exerted the small remains of their strength that was left them, and crawled up to the deck to feast themselves with this reviving prospect.'

The wind blew off the shore and made it difficult to effect a landing; but the scurvy-stricken were dying apace, and the few healthy men could not be spared to attend to the sick. At length, however, after three days' hard work, the invalids, numbering one hundred and eighty, were got safely to land, except some twelve who died in the boats on being exposed to the fresh air. Tents were soon erected and something like an

hospital extemporised. But so malignant was the disease and such a hold had it got on the men, that for the first ten or twelve days the average mortality amounted to five or six. Vegetables were fortunately abundant, and the radishes, celery, and watercresses were the best of medicine for the scurvy-stricken sailors. Anson gave as well as took, for he planted many garden-seeds and sowed the stones of fruit-trees, some of which have thriven well.

The next visitor was the Spaniard Ulloa, who came to the island in 1743. He was particularly struck by the number of dogs he saw, especially of the greyhound breed. These dogs had been sent by the Chilian and Peruvian governments in the hope of exterminating the goats, and thus depriving hostile warships and pirates of a possible means of re-provisioning. The plan, however, proved a failure, the goats being too agile in scaling the rocks to give their more swift-footed foes a chance. Ulloa urged the Spanish government to fortify the island and convert it into a penal settlement; but it is doubtful whether his advice would have been acted on, had not motives of jealousy powerfully seconded it. Information was received that, in consequence of Anson's report, England was thinking of establishing a settlement on Juan Fernandez. Their hand thus forced, the Spanish authorities occupied the island (1750) with a strong military force and built a fort commanding the harbour. This, however, was destroyed in the following year by an earthquake, and was rebuilt further inland. The post of governor seems to have been looked upon as one of the plums of the Spanish service. Vast sums were charged against the home government in respect of wholly unnecessary military works commenced but never completed, and the truth of a Spanish proverb was abundantly illustrated:

'Twixt pick and hoe,
The moneys go.

Ulloa's advice was also followed by utilising the settlement as a penal colony. When the South American revolution broke out, many of the Chilian and Peruvian patriots were condemned to exile here. At the end of the revolutionary wars the Chilians took over the settlement, and in 1819 established another penal colony. In the following year, there are said to have been three hundred convicts guarded by a hundred soldiers. In 1821, however, an insurrection broke out, and the settlement was for a time given up, the garrison being removed and the fort dismantled. At the same time the Chilian government, resolved that if they could not use the place no one else should, issued a manifesto forbidding any persons to settle there or kill the cattle or take the wood. Again, in 1828 and 1833 convict settlements were formed; but the cruelties practised on the prisoners led to outbreaks, successful in two instances. At length in 1835 the great earthquake destroyed the fortifications, and the convict establishment was finally abandoned.

But the traveller who climbs the brow of a hill fronting the harbour—barely half a mile from the landing-place—will still find the melancholy traces of these habitations of cruelty. The face of the cliff is excavated to a distance of several hundred feet, and long winding passages lead to

the dark and dripping cells where the convicts were immured. Beneath these, connected by rude earthen steps, are other cells darker and more chill, if that were possible, certainly smaller, for they are not more than five feet in length by six in height. These were reserved for offenders of the deepest dye. Here, in a very blackness of darkness, in a silence unbroken save by the curse of the jailer or the shock of the earthquake, the wretched victims of ignorance and cruelty passed through a life of torture to the oblivion of madness or to the rest of the grave.

The highest point on the island is a rugged rocky peak called *el Yunque* (the Anvil), or *Yonka*, which to all appearance is perfectly inaccessible. Even where the rock is covered with vegetation, the soil is so thin and friable that any attempt on the part of the climber to raise himself by clinging to shrubs, or even trees, would involve almost certain disaster. Thus, Walter, the chaplain to Anson's expedition, tells of a sailor who, being on the hills goat-hunting, caught hold of a tree upon a declivity to assist him in his ascent. This giving way, he immediately rolled down the hill; and though in his fall he fastened on another tree of considerable bulk, yet that too gave way, and he fell among the rocks and was dashed to pieces.

Since 1835, the Chilian government has leased the island to private speculators; and in 1868 it was purchased by Robert Wehrdan, a German engineer, who has established a small but thriving colony. In addition to tillage and stock-raising, hunting and fur-sealing, some trade is carried on with passing ships, especially whalers, which often put in for water. In the same year Her Majesty's ship *Topaze* visited Juan Fernandez, and erected a tablet to the memory of Alexander Selkirk at a spot known as 'Selkirk's Lookout.'

THIS MORTAL COIL.

CHAP. XL.—AT REST AT LAST.

WINIFRED fell back on the pillows wearily. 'I love him,' she whispered once more. 'He hates me, Elsie; but in spite of all, I love him, I love him.'

For years she had locked up that secret in her own soul. She had told it to no one, least of all to her husband. But, confined to the narrow space of her poor small heart, and battling there with her contempt and scorn, it had slowly eaten her very life out.

Her face was growing very pale now. After all this excitement, she needed rest. The inevitable reaction was beginning to set in. She fumbled with her fingers on the bedclothes nervously; her face twitched with a painful twitching. The symptoms alarmed and frightened Elsie; she opened the door of the little *salon* and signalled to the English doctor to return to the bedroom. He came in, and cast a keen glance at the bed. Elsie looked up at him with inquiring eyes. The doctor nodded gravely and drew his long beard through his closed hand. 'A mere question of hours,' he whispered in her ear. 'It may be delayed; it may come at any time. She's over-taxed her strength. Hysteria, followed by proportionate prostration. Her heart may fail from moment to moment.'

'Where's her husband?' Elsie cried in a fever of dismay.

'I've sent him off about his business for an hour's stroll,' the doctor answered with professional calmness. 'She's evidently in a highly hysterical condition, and the sight of him only increases her excitement. It's a sad case, but a painfully common one. A husband's presence is often the very worst thing on earth for a patient so affected. I thought it would do her far more good to have you alone with her—you're always so gentle and so soothing, Miss Challoner.'

Elsie glanced back at him with swimming eyes. 'But suppose she were to die while he's gone,' she murmured low with profound emotion.

The doctor pursed up his lips philosophically. 'It can't be helped,' he answered with a faint shrug. 'That's just what'll happen, I'm very much afraid. We can only do the best we can. This crisis has evidently been too severe for her.'

As he spoke, Winifred turned up from the bed an appealing face, and beckoned Elsie to bend down closer to her. 'Elsie,' she whispered, in a low hoarse voice, 'send out for Hugh. I want him now.—I should like to kiss him before I die. I think I'm going. I won't last much longer.'

Elsie hurried out to Warren in the anteroom. 'Go,' she cried eagerly, through her blinding tears.—'go and find Hugh. Winifred wants him; she wants to kiss him before she dies. Look for him through all the streets till you find him, and send him home. She wants to forgive him.'

Warren answered her never a single word, but, nodding acquiescence, rushed down by himself to the esplanade and the shore in search of his enemy. Poor baffled enemy, how his heart ached for him! At such a moment, who could help pitying him?

'Is he coming?' Winifred asked from the bed feebly.

'Not yet, darling,' Elsie answered in a hushed voice; 'but Warren's gone out to try and find him. He'll be here soon. Lie still and wait for him.'

Winifred lay quite still for some minutes more, breathing hard and loud on the bed where they had laid her. The moments appeared to spread themselves over hours. But no Hugh came. At last she beckoned Elsie nearer again, with a frail hand that seemed almost to have lost all power of motion. Elsie leant over her with her ear laid close to Winifred's lips. The poor girl's voice sounded very weak and all but inaudible now. 'I can't last till he comes, Elsie,' she murmured low. 'But tell him I forgave him. Tell him I asked him to forgive me in turn. Tell him I wanted to kiss him good-bye. But even that last wish was denied me. And Elsie'—her fingers clutched her friend's convulsively—'tell him all along I've always loved him. I loved him from the very depths of my soul. I never loved any one as I loved that man. When I hated him most, I loved him dearly. It was my very love that made me so hate him. He starved my heart; and now it's broken.'

Elsie stooped down and kissed her forehead. A smile played lambent over Winifred's face at the gentle kiss. The doctor lifted his open hand in warning. Elsie bent over her with gathered brows and strained her eyes for a sign of breath

for a moment. 'Gone?' she asked at last with mute lips of the doctor.

'Gone,' the calmer observer answered with a grave inclination of his head toward Elsie. 'Rapid collapse. A singular case. She suffered no pain at the last, poor lady.'

Elsie flung herself wildly into an easy-chair and burst into tears more burning than ever.

A touch on her shoulder. She looked up with a start. Could this be Hugh? Thank heaven, no! It was Warren who touched her shoulder lightly. Half an hour had passed, and he had now come back again. But, alas, too late. 'No need to stop here any longer,' he said reverently. 'Hugh's down-stairs, and they're breaking the news to him. He doesn't know yet you're here at all. I didn't speak to him. I thought some other person would move him more. I saw him on the quay, and I sent an Italian I met on the beach to tell him he was wanted, and his wife was dying.—Come up to my room on the floor above. Hugh needn't know even now, perhaps, that you're here at San Remo.'

Too full to speak, Elsie followed him blindly from the chamber of death, and stumbled somehow up the broad flight of stairs to Warren's apartments on the next story. As she reached the top of the open flight, she heard a voice—a familiar voice, that would once have thrilled her to the very heart—on the landing below, by Winifred's bedroom. Shame and fascination drew her different ways. Fascination won. She couldn't resist the dangerous temptation to look over the edge of the banisters for a second. Hugh had just mounted the stairs from the big entrance hall, and was talking by the door in measured tones with the English doctor.

'Very well,' he said in his cold stern voice, the voice he had always used to Winifred—a little lowered by conventional respect, indeed, but scarcely so subdued as the doctor's own. 'I'm prepared for the worst. If she's dead, say so. You needn't be afraid of shocking my feelings; I expected it shortly.'

She could see his face distinctly from the spot where she stood, and she shrank back aghast at once from the sight with surprise and horror. It was Hugh to be sure, but oh, what a Hugh! How changed and altered from that light and bright young dilettante poet she had loved and worshipped in the old days at Whitestrand! His very form and features, and limbs and figure, were no longer the same; all were unlike, and the difference was all to their disadvantage. The man had not only grown sterner and harder; he was coarser and commoner and less striking than formerly. His very style had suffered visible degeneration. No more of the jaunty old poetical air; turnips and foot-and-mouth disease, the arrears of rent and the struggle against reduction, the shifting sands and the weight of the riparian proprietors' question, had all left their mark stamped deep in ugly lines upon his face and figure. He was handsome still, but in a less refined and delicate type of manly beauty. The long smouldering war between himself and Winifred had changed his expression to a dogged ill-humour. His eyes had grown dull and sordid and selfish, his lips had assumed a sullen set, and a ragged beard with unkempt ends had disfigured

that clear-cut and dainty chin that was once so eloquent of poetry and culture. Altogether, it was but a pale and flabby version of the old, old Hugh—a replica from whose head the halo had faded. Elsie looked down on him from her height of vantage with a thrill of utter and hopeless disillusionment. Then she turned with a pang of remorse to Warren. Was it really possible? Was there once a time when she thought in her heart that self-centred, hard-hearted, cold-featured creature more than a match for such a man as Warren?

'She is dead,' the doctor answered with professional respect. 'She died half an hour ago, quite happy. Her one regret seemed to be for your absence. She was anxiously expecting you to come back and see her.'

Hugh only answered: 'I thought so. Poor child.' But the very way he said it—the half-unconcerned tone, the lack of any real depth of emotion, nay, even of the decent pretence of tears, shocked and appalled Elsie beyond measure. She rushed away into Warren's room, and gave vent once more to her torrent of emotion. The painter laid his hand gently on her beautiful hair. 'O Warren,' she cried, looking up at him half doubtful, 'it makes me ashamed'—And she checked herself suddenly.

'Ashamed of what?' Warren asked her low.

In the fever of her overwrought feelings, she flung herself passionately into his circling arms. 'Ashamed to think,' she answered with a sob of distress, 'that I once loved him!'

CHAPTER XLI.—REDIVIVA!

Hugh sat that evening, that crowded evening, alone in his dingy, stingy rooms with his dead Winifred. Alone with his weary, dreary thoughts—his thoughts, and a corpse, and a ghostly presence! Two women had loved him dearly in their time, and he had killed them both—Elsie and Winifred. It was a hateful night—hateful and ghastly; for in the bedroom at the side, the attendants of death, despatched by the doctor, were already busy at their gruesome work, performing the last duties for poor martyred Winifred.

He had offered her up on the altar of his selfish remorse and regret for poor martyred Elsie. The last victim had fallen on the grave of the first. She, too, was dead. And now his house was indeed left unto him desolate.

Somehow, as he sat there, with whirling brain and heated brow, on fire in soul, he thought of Elsie far more than of Winifred. The new bereavement, such as it was, seemed to quicken and accentuate the sense of the old one. Was it that Winifred's wild belief in her recognition of Elsie that day in the street had roused once more the picture of his lost love's face and form so vividly in his mind? Or was it that the girl whom Winifred had pointed out to him did really to some slight extent resemble Elsie? and so recall her more definitely before him? He hardly knew; but of one thing he was certain—Elsie that night monopolised his consciousness. His three-year-old grief was still fresh and green. He thought much of Elsie, and little of Winifred.

Late at night, the well-favoured landlady came

up, courteous and Italian, all respectful sympathy, in a black gown and a mourning head-dress, hastily donned, as becomes those who pay visits of condolence in whatever capacity to the recently bereaved. As for Hugh himself, he wore still his rough travelling suit of gray homespun, and the dust of his journey lay thick upon him. But he roused himself listlessly at the landlady's approach. She was bland, but sympathetic. Where would Monsieur sleep? the amiable proprietress inquired in lisping French. Hugh started at the inquiry. He had never thought at all of that. Anywhere, he answered, in a careless voice: it was all the same to him: *sous les toits*, if necessary.

The landlady bowed a respectful deprecation. She could offer him a small room, a most diminutive room, unfit for Monsieur, in his present condition, but still a *chambre de maître*, just above Madame. She regretted she was unable to afford a better; but the house was full, or, in a word, crowded. The world, you see, was beginning to arrive at San Remo for the season. Proprietors in a health-resort naturally resent a death on the premises, especially at the very outset of the winter: they regard it as a slight on the sanitary reputation of the place, and incline to be rude to the deceased and his family. Yet nothing could be more charming than the landlady's manner; she swallowed her natural internal chagrin at so untoward an event in her own house and at such an untimely crisis, with commendable politeness. One would have said that a death rather advertised the condition of the house than otherwise. Hugh nodded his head in blind acquiescence. 'Où vous voulez, Madame,' he answered wearily. 'Up-stairs, if you wish. I'll go now.—I'm sorry to have caused you so much inconvenience; but we never know when these unfortunate affairs are likely to happen.'

The landlady considered in her own mind that the gentleman's tone was of the most distinguished. Such sweet manners! So thoughtful—so considerate—so kindly respectful for the house's injured feelings! She was conscious that his courtesy called for some slight return. 'You have eaten nothing, Monsieur,' she went on, compassionately. 'In effect, our sorrow makes us forget these details of every-day life. You do not derange us at all; but you must let me send you up some little refreshment.'

Hugh nodded again.

She sent him up some cake and red wine of the country by the Swiss waiter, and Hugh ate it mechanically, for he was not hungry. Excitement and fatigue had worn him out. His game was played. He followed the waiter up to the floor above, and was shown—into the next room to Warren's.

He undressed in a stupid, half dead-alive way, and lay down on the bed with his candle still burning. But he didn't sleep. Weariness and remorse kept him wide awake, worn out as he was, tossing and turning through the long slow hours in silent agony.

Strange to say, the sense of freedom was the strongest of all the feelings that crowded in upon him. Now that Winifred was dead, he could do as he chose with his own. He was no longer tied to her will and her criticisms. When he

got back to England—as he would get back, of course, the moment he had decently buried Winifred—he meant to put up a fitting grave-stone at Orfordness, if he sold the wretched remainder of Whitestrand to do it. A granite cross should mark that sacred spot. Dead Elsie's grave should no longer be nameless. So much, at least, his remorse could effect for him.

For Winifred was dead, and Whitestrand was his own. At the price of that miserable manor of blown sand he had sold his own soul and Elsie's life; and now he would gladly get rid of it all, if only he could raise out of its shrunken relics a monument at Orfordness to Elsie. For three long years, that untended grave had silently accused the remnants of his conscience: he determined it should accuse his soul no longer.

The big clock on the landing ticked monotonously. Each swing of the pendulum tortured him afresh; for it called aloud to his heart in measured tones. It cried as plain as words could say: 'Elsie, Elsie, Elsie, Elsie!'

Ah, yes! He was young enough to begin life afresh, if that were all. To begin all over again is less than nothing to a brave man. But for whom or for what? Selfish as he was, Hugh Massinger couldn't stand up and face the horrid idea of beginning afresh for himself alone. He must have some one to love, or go under for ever.

And still the clock ticked and ticked on; and still it cried in the silence of the night: 'Elsie, Elsie, Elsie, Elsie!'

At last day dawned, and the morning broke. Pale sunlight streamed in at the one south window. The room was bare—a mere servant's attic. Hugh lay still and looked at the gaping cracks that diversified the gaudily painted Italian ceiling. All night through, he had fervently longed for the morning, and thought when it came he would seize the first chance to rise and dress himself. Now it had really come, he lay there unmoved, too tired and too feeble to think of stirring.

Five—six—half-past six—seven. He almost dozed out of pure weariness.

Suddenly, he woke with a quick start. A knock at the door!—a timid knock. Somebody come with a message, apparently. Hugh rose in haste and held the door just a little ajar to ask in his bad Italian, 'What is it?'

A boy's hand thrust a letter sideways through the narrow opening. 'Is it for you, signor?' he asked, peering with black eyes through the chink at the Englishman.

Hugh glanced at the letter in profound astonishment. O heavens, what was this? How incredible—how mysterious! For a moment the room swam wildly around him; he hardly knew how to believe his eyes. Was it part of the general bewilderment of things that seemed to conspire by constant shocks against his perfect sanity? Was he going mad, or was some enemy trying to confuse and confound him? Had some wretch been dabbling in hideous forgeries? For the envelope was addressed—O horror of horrors!—in dead Elsie's hand; and it bore in those well-known angular characters the simple inscription, 'WARREN RELF, Esq., Villa della Fontana (Piano 3°), Avenue Vittorio-Emmanuele, San Remo.'

He recognised this voice from the grave at once. Dead Elsie! To Warren Relf! His fingers clutched it with a fierce mad grip. He could never give it up. To Warren Relf! And from dead Elsie!

'Is it for you, signor?' the boy asked once more, as he let it go with reluctance from his olive-brown fingers.

'For me?—Yes,' Hugh answered still clutching it eagerly. 'For me!—Who sends it?'

'The signorina at the Villa Rossa—Signorina Chalonier,' the boy replied, getting as near as his Italian lips could manage to the sound of Chalonier. 'She told me most stringently to deliver it up to yourself, signor, into your proper fingers, and on no account to let it fall into the hands of the English gentleman on the second story.'

'Good,' Hugh answered, closing the door softly. 'That's quite right. Tell her you gave it me.' Then he added in English with a cry of triumph: 'Good-morning, jackanapes!' After which he flung himself down on the bed once more in a perfect frenzy of indecision and astonishment.

For two minutes he couldn't make up his mind to break open that mysterious missive from the world of the dead, so strangely delivered by an unknown hand at his own door on the very morrow of Winifred's sudden death, and addressed in buried Elsie's hand, as clear as of old, to his dearest enemy. What a horrible concatenation of significant circumstances. He turned it over and over again, unopened, in his awe; and all the time that morose clock outside still ticked in his ear, less loudly than before: 'Elsie, Elsie, Elsie, Elsie!'

At last, making up his mind with a start, he opened it, half overcome with a pervading sense of mystery. And this was what he read in it, beyond shadow of doubt, in dead Elsie's very own handwriting:

VILLA ROSSA, Thursday, 7.30, morning.

DEAREST WARREN—I will be ready, as you suggest, by the 9.40. But you mustn't go with me farther than Paris. That will allow you to get back to Edie and the Motherkin by the 6.39 on Saturday evening.—I wish I could have waited here in San Remo till after dear Winifred's funeral was over; but I quite see with you how dangerous such a course might prove. Every moment I stop exposes me to the chance of an unexpected meeting. You must call on Hugh when you get back from Paris, and give him poor Winifred's last forgiving message. Some day—you know when, dearest—I may face seeing him myself, perhaps; and then I can fulfil my promise to her in person. But not till then. And that may be never. I hardly know what I'm writing, I feel so dazed; but I'll meet you at the station at the hour you mention.—No time for more. In great haste—my hand shakes with the shock still.—Yours ever lovingly and devotedly, ELSIE.

The revulsion was awful. For a minute or two, Hugh failed to take it all in. You cannot unthink past years at a jump. The belief that Elsie was dead and buried at Orfordness had grown so ingrained in the fabric of his brain that at first he suspected deliberate treachery. Such things have been. He had forged himself: might not Warren Relf, that incarnate fiend, be turning his own weapon—meanly—against him?

But as he gazed and gazed at dead Elsie's hand—dead Elsie's own hand—unmistakably hers—no forger on earth (not even himself) was ever half so clever—the truth grew gradually clearer and clearer. Dead Elsie was Elsie dead no longer; she had escaped on that awful evening at Whitestrand. It wasn't Elsie at all that was buried in the nameless grave at Orfordness. The past was a lie. The present alone—the present was true. Elsie was here, to-day, at San Remo!

He buried his face in his hands and wept—wept as he never had wept for Winifred—wept as he never had wept in his life before—wept with frantic gladness for Elsie recovered.

Slowly his conceptions framed themselves anew. His mind could only take it all in piecemeal. Bit by bit he set himself to the task—no less a task than to reconstruct the universe.—Winifred must have known Elsie was here. It was Elsie herself that Winifred and he had seen yesterday.

Fresh thoughts poured in upon him in a bewildering flood. He was dazzled, dazed, dumfounded with their number. Elsie was alive, and he had something left, therefore, to live for. Yesterday morning that knowledge would have been less than nothing worth to him while Winifred lived. To-day, thank heaven—for Winifred was dead—it meant more to him than all the wealth of Croesus.

How opportunely Winifred had disappeared from the scene! In the nick of time—on the very stroke and crisis of his fate! At the turn of the tide that leads on to fortune! *Felix opportunitate mortis*, indeed! He had no regret, no remorse now, for poor betrayed and martyred Winifred.

Winifred! What was Winifred to him, or he to Winifred, in a world that still held his own beloved Elsie?

All's well that ends well. The Winifred episode had come and gone. But Elsie remained as permanent background.

And how strangely Winifred herself, in her mad desire, had contributed to this very *dénouement* of his troubles. 'I shall go to San Remo, if I go at all, and to nowhere else on the whole Riviera. I prefer to face the worst, thank you!' The words flashed back with fresh meaning on his soul. If she hadn't so set her whole heart on San Remo, he himself would never have thought of going there. And then, he would never have known about Elsie. For that at least, he had to thank Winifred.

'When I'm dead and gone, you can marry Elsie!'

But what was this discordant note in the letter—Elsie's letter—to Warren Relf—Warren Relf, his dearest enemy? Was Warren Relf at the *pension*, then? Had Warren Relf been conspiring against him? In another flash, it all came back to him—the two scenes at the Cheyne Row Club—Warren's conversation with his friend Potts—the mistakes and errors of his hasty preconceptions. How one fundamental primordial blunder had coloured and distorted all his views of the case! He felt sure now, morally sure, that Warren Relf had rescued Elsie—the sneak, the eavesdropper, in his miserable mud-boat! And yet—if Warren Relf hadn't done so, there would be no Elsie at all for him now to live for. He recognised the

fact; and he hated him for it. That he should owe his Elsie to that cur, that serpent!

Discordant note! Why, yes—see this: ‘Some day—you know when, dearest—I may face seeing him myself, perhaps. But not till then. And that may be never.’

That may be never! O precious words! She was leaving the door half open, then, for her poet.

Poet! His heart leaped up at the thought. New vistas—old vistas long since closed—opened out afresh in long perspective before him. Ay, with such a fount of inspiration as that, to what heights of poetry might he not yet attain! What peaks of Parnassus might he not yet scale! On what pinnacles of glory might he not yet poise himself! Elsie, Elsie, Elsie! That was a talisman to crush all opposition, an ‘Open Sesame’ to prise all doors. With Elsie’s love, what would be impossible to him?

Life floated in new colours before his eager eyes. He dreamed dreams and saw visions, as he lay on his bed in those golden moments. Earth was dearer, fairer, than he ever deemed it. The fever of love and ambition and hate was upon him now in full force. He reeled and revelled in the plenitude of his own wild and hectic imagination. He could do anything, everything, anything. He could move mountains in his fervent access of faith; he could win worlds in his mad delight; he could fight wild beasts in his sudden glory of heroic temper.

And all the while, poor dead Winifred lay cold and white in the bedroom below. And Elsie was off—off to England—with Warren Relf—that wretch! that serpent!—by the 9.40.

THE ALPHABET.

It is by no means improbable that some of our readers on glancing at the above title may be tempted to exclaim, ‘The Alphabet! What can there possibly be to say about that?’ At first sight, we grant, the subject does not promise to be an interesting one, nor to offer a very wide field for profitable consideration. And yet nothing can be farther from the truth. The letters of the alphabet are an instance of the greatest effect produced by the smallest means. If we except Chinese symbols, it may perhaps be said that all correspondence between man and man, all that connects one age with another on the page of history, depends upon these characters, which are so familiar to us from our earliest years that there is nothing, as some might think, to say about them that is either interesting or instructive.

The reverse is the fact. For when we look a little deeper into the matter, and inquire in what manner the letters of the alphabet have come to assume their present shapes, who their ancestors were, where they arose, by what processes they have been evolved, and how long a period elapsed before they finally assumed their present forms, a most interesting field of inquiry at once opens out before us, and one with which very few people, save specialists, have more than a limited acquaintance.

We used just now the word ‘ancestors:’ this reminds us that we sometimes hear people boast of the antiquity of their families, and relate with pardonable pride how an ‘ancestor’ of theirs was a contemporary of some celebrated personage who figured in the page of history so many hundred years ago; or that they are descended from a family whose achievements in arms, or art, or literature won for them, in ages long since gone, fame and wealth. But all such boasting, natural as it may be, pales and fades into insignificance before the claims to family antiquity which the letters of the alphabet are able to prefer. For if they could speak—as, according to Jewish tradition, the Hebrew letter *yod* once did to the Almighty—if they could narrate their experience, they might boast of a history extending not merely over a few centuries, but reaching back into a past so remote that contemplation begets bewilderment. The ‘ancestors’ of those very letters which meet the eyes of the readers of this page are no other than the ancient Egyptian hieroglyphics, which we find on monuments actually older than the Pyramids. It may be a new idea to many, but it is now almost universally admitted that the letters of our alphabet may be traced through successive phases to the ancient pictorial characters of Egypt. Who would have thought it? Incredible as it may seem, the letters with which this page is printed are the lineal descendants of the characters which were in full use when the early Pharaohs sat on the Egyptian throne, and which any of the curious may see for themselves by visiting the Egyptian Court in the British Museum, or the obelisk which now adorns the Thames Embankment.

But before attaining their present form, these letters have undergone many a change and experienced many a vicissitude.

To begin at the beginning, with the Egyptian hieroglyphics. It must be remembered that these quaint symbols were not an alphabet in our sense of the word. All of them originally were meant to represent not sounds, but things or ideas. The picture of a sail meant air, breath, the winds. The figure of a sharp-pointed knife stood, in the proper connections, for to cut, to prick, to kill, to whet. But by degrees some of the hieroglyphs came to stand simply for sounds; they became what are called *phonograms*. There seem to have been as many as four hundred phonograms, some of which stood for the sounds of entire words, others for the sounds of syllables, while some forty-five of them stood for still simpler sounds, and so had nearly an alphabetic value. But with such a multiplicity of signs, and of different values for the signs, reading and writing must for ancient Egyptians have always proved a pretty laborious business.

At a very early period, the Phœnicians, a great trading people, came from Tyre and Sidon, and had settlements in Egypt. Keenly alive to the value of written records, they managed to secure the advantages of the Egyptian writing

without its tediousness and cumbrousness; and of the enormous number of Egyptian signs they employed only as many as they found necessary to express the sounds of their own language, which was much the same as that of the Jews. They left the hieroglyphs for ideas and those for words and for syllables alone; and out of the forty-five alphabetic symbols selected twenty-one of the most suitable. To these twenty-one they probably added another of their own invention; and had now, for the first time in the history of the world, a single simple alphabet. From this alphabet are derived not merely that which we use, but all the alphabets of the world, directly or indirectly, including the Arabic, the various Indian alphabets, and even the Malay.

The Phœnicians did not copy the hieroglyphic form of the twenty-one hieroglyphs they selected. They found ready to their hand a more convenient form of them. For the Egyptian priests, writing on papyrus, had already come to use simplified forms of the hieroglyphs. Instead of the complete figure of an eagle, for example, the priests made a single twisted curved stroke something like a 2. It was this, the priestly or hieratic form, that the Phœnicians took over; but they did not exactly copy the hieratic characters. The Phœnician letters as known to us were not written on a smooth substance like papyrus, but scratched or carved on hard surfaces; and so they came to differ considerably from their models, being more angular and stiffer than the flowing curves suited for papyrus writing.

The Greeks believed that they learnt their letters from a Phœnician called Cadmus. That they got them from the Phœnicians with whom they traded, is certain, for the forms of the oldest Greek letters are nearly identical with those of Phœnician inscriptions yet extant. 'Cadmus' is probably simply the Phœnician *Kadmon*, 'Man of the East.' The Greek colonists who settled in Italy took a form of their alphabet with them, and this the Romans borrowed. And from the Romans the nations of the greater part of modern Europe and America have obtained the alphabet now used by them.

The table on the opposite page has been prepared to show the principal changes which the hieroglyphs underwent in passing from the Egyptians to the Phœnicians, and from them to the Greeks and Romans. It is taken from the article on the 'Alphabet' in the new edition of *Chambers's Encyclopædia* (vol. i. 1888); which article is by Canon Isaac Taylor, author of the most important recent work on the subject—*The Alphabet* (2 vols. 1883).

The column on the left (column I.) shows the Egyptian hieroglyphs; col. II. the hieratic form of them; col. III. the Phœnician letters; cols. IV. to VII. the chief Greek forms of the same alphabetic signs; cols. VIII. to X. the Roman or Latin forms; while col. XI. is the square or later Hebrew—the oldest Hebrew having been nearly identical with the Phœnician.

It will be observed that col. VII., the Greek minuscules, or small letters, and col. X., the Latin minuscules, resemble the small letters of our own alphabet; while cols. IV. V. VI. VIII. and IX., the majuscules, look like capitals. It is the fact that our small letters are derived from the Latin minuscules, which were derived from the majus-

cules. But it should be noted that whereas Greeks and Romans wrote entire books in majuscule or capital letters only, we have found reason for printing the bulk of our literary matter in minuscules, while we intersperse capitals or majuscules here and there, at the beginning of sentences, in proper names, and the like.

We have not yet explained the word *alphabet*. In the first column of the table we see that the Egyptian hieroglyph which, when taken with alphabetic value, corresponded to A, was a picture of an eagle with beak and claws complete, and was called *Ahom*, the Egyptian word for eagle. That corresponding to our B was the picture of a crane, very graphically drawn. The Phœnicians got their A, however, not from the drawing of the eagle, but from the double curve of the hieratic writing; and making a kind of triangle with points projecting, called it *Aleph*, the Phœnician word for ox. Perhaps they saw in the symbol as they made it a resemblance to the head and horns of an ox; perhaps they just took the first convenient word in their own tongue that commenced with the sound of A. Just as we say to children, 'A was an archer who shot at a frog, B was a butcher who had a great dog,' not because A is *like* an archer or B like a butcher, but because 'archer' begins with A, and 'butcher' with B. So that, whether the character of *Aleph* is like an ox, or that of *Beth* like a house or tent, or that of *Gimel* like the head and neck of a camel, certain it is that *Aleph* begins with A, *Beth* with B and *Gimel* with G. The word *Aleph* in Greek became *Alpha* (a word that has no meaning in Greek), and *Beth* was made *Beta*, also quite unmeaning to Greek ears; and so the noble name of *alphabet* is a contracted form of *Alpha-beta*, Greek corruptions of *Aleph-beth*, Phœnician and Hebrew words for 'ox' and 'house.' However this may be, we yet owe a heavier debt of gratitude than we can easily realise to the Romans, who passed on the obligation from Greek colonists, they from Phœnician trading sailors, and they from Egyptian priests of a time long prior to the Hebrew exodus; while the Egyptian priests were the descendants and debtors of many generations of the ingenious, laborious, mysterious people who built pyramids, sculptured vast temples, painted rock tombs, adorned coffins, and embalmed their nearest and dearest to be exhibited as Egyptian mummies in every great European museum.

And if the letters have seen various forms, it is no less true that the mode of writing has varied considerably. At one time the scribe wrote in vertical columns, from the top of the page to the bottom, as is the custom in China and Japan to-day: at other times he wrote from right to left, a method adopted in the very early Greek inscriptions: at other times, again, in the style technically known as *boustrophædon*, that is, in the manner of an ox ploughing furrows in a field, beginning a fresh line on the same side on which the last left off: and finally, sometimes he wrote from left to right, as we do now, each line commencing immediately beneath its predecessor.

It is a far cry from the sands of Gizeh to London; but if King Cheops, who built the Great Pyramid, were now to be shown a page of the *Times*, he would actually see, though he

would probably fail to recognise in the letters before him, the descendants of those pictorial hieroglyphs that were in common use in his day.

MRS FARQUHARSON'S NIECE.

CHAP. III.—AN UNSEEN LISTENER.

As already mentioned, I purposed going to Shuttleton that afternoon. My business was to buy some wool for a sofa-blanket which I intended knitting as a present to the curate's wife, whom I occasionally visited. On leaving the wool-shop, a heavy shower of rain came on, and I hurried along for shelter to the inn, to Mrs Jenkyns. I found that lady in the midst of a hubbub caused by the arrival of a picnic party, who were occupying her large back room and all demanding to be served immediately.

'Oh, it is you, miss.—Just go up-stairs to my room till the rain is over. I am so busy, I don't know which way to turn.'

I went up-stairs as directed. The inn was an old-fashioned square sort of building, three stories in height. Mrs Jenkyns' room was on the first floor. On the flat above, the rooms were seldom used, except when the inn was full, which was not often. I had heard Mrs Glass speak of the view of the Manor grounds to be obtained from the upper windows; and as Mrs Jenkyns would not object to my taking the liberty, I left my parcel and umbrella in her room and proceeded to the upper story. There were three rooms looking to the back. Formerly, there had been but two; a wooden partition had, however, been erected, dividing the larger room, and leaving a small bedroom facing the stair. It was this room into which I entered. I glanced from the window: the rain was still pouring steadily. In the distance I saw nearly the entire grounds of the Manor. The trees of the avenue hid the house itself; but the river winding round behind it and the little island not far from the house were visible. A person with a small telescope or opera glass could easily have distinguished people walking in the grounds. I thought the view would be even better from the window of the room to the right, and I was about to go into it, when I heard heavy footsteps below on the first stair. I did not think of the persons ascending to the upper story, yet I paused to listen. I could hear the voices of two men as they ascended. They did not stop at the first landing, but were evidently coming higher. I did not wish to be disturbed, and hastily turned back into the room and slipped the bolt softly into the socket, afraid lest they might be the worse of liquor. Their heavy footsteps drowned the noise I made. At the second landing the men turned into the room to the right. The partition between being of wood, I could distinctly hear every word of their conversation.

'You are sure we cannot be overheard here, Jacobs?' said one of them in a voice the smooth tones of which I did not like.

'Perfectly certain. I am the only one on this flat, and they are all engaged down-stairs; but I will look and see, in case. I selected this room because of the view. Look! You can see nearly the entire Manor grounds, with the exception of

the little bit near the river on to the turn, and the garden at the back of the house, which are hidden by the big close hedge dividing them from Farmer Shiell's ground.—I will be back in a minute.'

I heard him leave the room, walk along the landing to the room on the left, and next try the door of the room where I was. There were two rooms to the front, which he also examined.

'There is no one here but ourselves,' he said to his companion. 'The room next to us is locked, and there is no one in the others.'

'Well,' said the other man, 'you can tell me now how matters stand. You say you sent on word to headquarters this morning. I left shortly after mid-day, before your letter arrived. I was fortunate in meeting you so near your inn; I was afraid you might be away somewhere.'

'I would have been, but for this confounded rain, which drove me home.—The game is nearly played out, Jack. Our bird is caged to a certainty.'

'No!' cried Jack in a tone of surprise.—'Then he is here, after all.—Have you seen him?'

'Not near enough till yesterday to be able to swear positively to him. But I am now certain it is he, and no one else. He never comes outside the grounds, and there is no hiding-place near enough the house to allow one to get a close view. There is some shrubbery near to the gate where one can hide; from that place of concealment I have seen him frequently at a distance strolling about the grounds in company with his old fossil of an uncle, or with that little governess or companion, or whatever she is. How I have laughed to myself when I saw them going about, to think how, if my suspicions were correct, the little companion would stare when once she found it all out. Yesterday, he came very near the shrubbery in his walk, and I got a proper look at him. It is he beyond a doubt; and a very good-looking girl he makes.'

I sat as if turned into stone. Until this last sentence, was uttered, the idea that their conversation in any way affected myself had not dawned upon me. Now, a dreadful suspicion that I was only too closely connected with it almost overwhelmed me. Eagerly I strained every nerve to catch their next words.

'How did you manage it? I mean, how did you get on the scent at first?'

'Easy enough. You know I had often seen him along with old Balscombe's nephew, and knew that they were both given to gambling and betting, the difference being that this youngster had very little money, while young Balscombe had plenty. After the forgery was discovered, the young gentleman was accused of it, and of course denied it, though it was as clear as noon-day against him. If he had admitted it, old Balscombe, I believe, would have forgiven him; for he had a great liking for the lad, and intended leaving his business to his nephew and him, ere long. But he was enraged at the young man's hardihood and brazen-facedness, and was determined to punish him. He is a very stern old boy. He gave instructions to have him apprehended; but the youngster contrived to get word of it and give us the slip. I believe old Bates the cashier gave him the wink; and I suspect he is keeping him posted up as to how matters stand, though of course he does not know I am here,

and cannot inform him.—Well, after I had exhausted every source of inquiry, and made pretty sure that my bird was not in hiding in town, I began to make inquiry as to any relatives or friends he might possess. I found out from young Balscombe that he had no other relatives save a couple of aunts, both by his mother's side—one in this place, and another down in Hampshire; and an old uncle who wasn't of much account. This being nearest, I came here first. I then discovered that his aunt, Mrs Farquharson, lived here very retired with her brother—the old uncle whom I mentioned—her servants, and a young girl as companion; but that she had at present a niece staying with her, whom nobody could tell me much about. I succeeded in ascertaining, however, that her name was Selwyn, that she had but recently come here, and that her mother was a sister of Mrs Farquharson's. As you know, I suspected this niece might be my young gentleman in disguise, for I had heard of the same trick before. I therefore determined not to leave the place until I saw her, which I did while she was walking about the Manor grounds, as I have already told you; but though I was almost certain it was the gentleman I wanted, he was well disguised, and I could not get a near view till yesterday afternoon. Two days ago, I waylaid one of the servants, and, by adroit questioning, found out, amongst other things, that the supposed niece had arrived here rather unexpectedly, and with scarcely any luggage, on the afternoon of the day on which young Vanburgh left his lodgings; and that she was a very peculiar young lady in her ways. This confirmed my suspicions. Still, the young lady might turn out to be a bonâ-fide Miss Selwyn after all. Meantime, Bob was making inquiry down in Hampshire regarding the other aunt.

'But,' interrupted Jack, 'if you were so certain yesterday afternoon, why did you not telegraph at once to headquarters?'

'Because I waited till I had Bob's report, which I expected last night by the eight o'clock post; and I would not have got the warrant till this afternoon at anyrate, probably; so little time has been lost. I *did* get his report. He says that there is a Mrs Selwyn residing in Brackley in that county, an aunt of young Vanburgh's, who has indeed a daughter; but the poor girl is silly, and is never seen outside the house. Her mother never leaves her. She is an only child. Therefore, the Miss Selwyn who is here must be an impostor.—A clever young dog, is he not, but not clever enough for me.—Eh, Jack?'

'What do you intend doing now? Have him apprehended, I suppose?'

'Yes; but not until to-morrow morning. Bob will arrive to-night with the warrant, for we must have everything perfectly formal, in case they should show fight. We could apprehend him to-night; but there is really no hurry, as I am certain they suspect nothing. Besides, I am dead-tired. I have been haunting that blessed shrubbery till I am as stiff as a post. I was up there this forenoon.—Have a look through this opera-glass.—There! You can see most that passes in the Manor grounds; it brings them quite close. I told you I selected this room because of the view. Thank goodness, the game is about over now.—Let us go down-stairs and have a drink,

and then we will have a stroll round. The rain has gone off now. You will, of course, wait here to-night and see the fun to-morrow morning. You can have the room next mine.'

I would have given anything to be safe home at the Manor. My limbs trembled so that I could hardly stand. Everything was now clear to me. Miss Selwyn was Mrs Farquharson's nephew, Jack Vanburgh, in disguise! I had often heard of him, though I had never seen him; but I knew his aunt saw him sometimes when she went to London, and that she had sent home money from India for his education, he having been left an orphan early. Till lately, he had lived with an uncle, a bachelor brother of his father's, who had died some four months ago. Since that time he had been in lodgings.

Trembling like a criminal going to execution, I stole down-stairs after the men left their room. What if they should observe me and suspect? They were still about the premises. Mrs Jenkyns, too, might say something which would reach their ears. I determined to effect my exit by the back way, and out at the garden gate into the little lane beyond. In this I was successful. I got out of the inn unobserved. The rain had ceased; but I was in no mood to care although it had been pouring. My thoughts were concentrated on reaching home without delay. Something must be done to save Miss Selwyn—or rather Mr Vanburgh. I felt my face redden as I thought how frequently I had allowed the pseudo Miss Selwyn to kiss me; and I could now understand the half-frightened looks of Mrs Farquharson at these times. The use of the razor and the smoking of the cigars were now no longer to be wondered at.

I reached the Manor in a whirl of excitement. The hall door was open, and I made my entrance unobserved. I was afraid my looks might have excited comment. Even amidst my agitation, I had hurriedly thought over a plan by which the detective might be foiled, if only it could be managed. We had yet a little time to spare.

'My dear girl, what is the matter?' Mrs Farquharson cried as I bounced unceremoniously into her sitting-room. 'You look as if some one was after you.'

'Where is Miss Selwyn?—Mr Vanburgh, I mean?'—I cried breathlessly. 'O Mrs Farquharson, we must save him. They have found out he is here, and are going to apprehend him and take him to prison.'

I thought she would have fainted, she turned so white; but she commanded herself with a violent effort. 'Calm yourself, and tell me all, Naomi,' she said soothingly, taking in the situation at once. 'Miss Selwyn—that is, Jack—is up-stairs.'

Hurriedly I related all that had occurred, to which she listened with strained attention. 'You are a good brave girl, Naomi!' she said when I had finished. 'Let us go and tell Jack. Between us, we will surely manage to save him. I thank Heaven, child, that you happened to go to the village this afternoon.'

We found Mr Vanburgh up-stairs, seated before the fire in his room, his heels on a level with his head, engaged in the unladylike occupation of smoking a cigar. 'Hillo! I thought the door was bolted,' he said, starting to his feet as we came sweeping in.—'Why, what the deuce!'—he

exclaimed, catching sight of me, and confusedly glancing from me to the cigar in his hand.

'Naomi knows everything,' said Mrs Farquharson. 'O Jack, you are in great danger;' and she hastily repeated the substance of what I have related.

'By Jove! you are a plucky little girl!' said he, after he had heard all. 'I must get out of here to-night somehow; but where I am to go beats me. I would have gone out of the country at first; but I had neither time nor money; besides, I might have been seized before I could have taken my passage out, and without luggage it would have looked suspicious.'

'If you are willing to go abroad, I can put you on a plan,' I said. 'I thought of it on the way here. Money is not even necessary for your passage until it can be remitted you, if you have sufficient for your wants otherwise.'

'That can be managed, for I have two hundred pounds lying here in cash,' interrupted Mrs Farquharson. 'I sent to my bankers for it only this week, in case of an emergency of this kind.—But for your plan, Naomi?'

'It is this,' said I: 'A friend of my father's, Captain Gray, a Scotchman, like papa, and an old schoolmate of his, sails for Australia by the ship *Dido*, leaving London to-morrow morning early, as my mother's letter mentioned yesterday. He will do anything for papa, or for me either, for I am named after his wife, who is dead. My plan is, that Mr Vanburgh leaves here at once, carrying with him a letter from me to papa, and catches the twenty-five minutes to eight train at Harley Junction, which you know is but four miles from here. It is now half-past five, and he has ample time to walk the distance. That train does not stop at Shuttleton, and even although it did, he dare not risk going there. He will reach London before ten o'clock, and can at once take a cab to papa's, who is sure to be at home at that hour. My letter will state that Miss Selwyn is a friend of mine who has been imperatively summoned to Australia—say to Sydney, at once, and ask papa to secure a passage for her immediately with Captain Gray. The suddenness of the call will excuse the want of luggage. Papa will ask no questions. If Mr Vanburgh thinks it expedient, he can confide in Captain Gray, who is to be trusted, during the passage; or if not, can resume his own dress after landing.'

'Your plan is admirable, child,' said Mrs Farquharson, kissing me fervently.—'Jack, she has thought of everything.'

'I will go and write at once, then,' I said, 'if you will order tea without delay.'

SOME MONSTER NUGGETS.

THERE was recently on exhibition in the city of London the largest 'nugget,' or, to use a phrase that will perhaps be more readily understood by the majority of non-colonial readers, lump of gold that has been found of recent years in the Australian colonies. Its weight was 617 ounces, and its value in current coin £2400. But, though this 'Lady Loch' nugget (for so it was named, after the wife of Sir Henry Brougham Loch, the present Viceroy of the colony of Victoria, in which it was found) attracted a large amount of attention at the antipodes, and was also an object

of considerable curiosity in London, it would have been thought little of some twenty or thirty years ago, when monster nuggets were no novelties on the colonial goldfields. But these large masses of gold were mostly found on or near the surface, and ever since the era of deep-sinking commenced, they have been but rarely met with. As most people are aware, gold-mining in Australia is now chiefly carried on by the systematic crushing of the auriferous quartz, which is brought to the surface from depths exceeding two thousand feet in some instances. In the early digging days the workings were almost entirely of a superficial character, and it was in the alluvial soil thus opened up that most of the monster nuggets were discovered from time to time. A lengthy official list of these interesting lumps of gold is given in the chapter commencing at page 355 of Mr Brough Smyth's *Goldfields and Mineral Districts of Victoria* (Trübner, London, 1869); and further information on the subject will be found in Mr George Sutherland's interesting *Tales of the Goldfields* (George Robertson, Melbourne, 1880), and in a scientific treatise entitled *Notes on the Physical Geography, Geology, and Mineralogy of Victoria* (George Robertson, Melbourne, 1866), by Alfred R. C. Selwyn and George Ulrich.

It is a noteworthy fact that one colony, Victoria, has not only produced the largest nugget the world has ever seen, but has outdistanced all competitors in the quantity and variety of its lesser golden glories. The famous nugget answering to the above description is known in history as the 'Welcome Stranger.' It was discovered under singular circumstances in the Dunolly district of Victoria, which is one hundred and ten miles north-west of the capital, Melbourne, by two Cornish miners named Deeson and Oates. Their career is remarkable, as showing how fortune, after frowning for years, will suddenly smile on the objects of her apparent aversion. These two Cornishmen emigrated from England to Australia by the same vessel in 1854. They betook themselves to the far-famed Sandhurst Goldfield in Victoria; they worked together industriously for years, and yet only contrived to make a bare livelihood by their exertions. Thinking that change of place might possibly mean change of luck, they moved to the Dunolly Goldfield, and their spirits were considerably raised by the discovery of some small nuggets. But this was only a momentary gleam of sunshine, for their former ill-luck pursued them again, and pursued them even more relentlessly than before.

The time at last came, on the morning of Friday, February 5, 1869, when the storekeeper with whom they were accustomed to deal refused to supply them any longer with the necessaries of life until they liquidated the debt they had already incurred. For the first time in their lives they went hungry to work, and the spectacle of these two brave fellows fighting on an empty stomach against continued ill-luck must have moved the fickle goddess to pity and repentance. Gloomy and depressed as they naturally were, they plied their picks with indomitable perseverance, and while Deeson was breaking up the earth around the roots of a tree, his pick suddenly and sharply rebounded by reason of its having struck some very hard substance. 'Come and see what this is,' he called out to his mate. To their

astonishment, 'this' turned out to be the 'Welcome Stranger' nugget; and thus two poverty-stricken Cornish miners became in a moment the possessors of the largest mass of gold that mortal eyes ever saw, or are likely to see again. Such a revolution of fortune is probably unique in the annals of the human race. Almost bewildered by the unexpected treasure they had found at their feet, Deeson and Oates removed the superincumbent clay, and there revealed to their wondering eyes was a lump of gold, a foot long and a foot broad, and so heavy that their joint strength could scarcely move it. A dray having been procured, the monster nugget was escorted by an admiring procession into the town of Dunolly, and carried into the local branch of the London Chartered Bank, where it was weighed, and found to contain 2268½ ounces of gold. The Bank purchased the nugget for £9534, which the erstwhile so unlucky, but now so fortunate, pair of Cornish miners divided equally between them. Whether the storekeeper who refused them the materials for a breakfast that morning apologised for his harsh behaviour, history relates not, but the probability is that he was paid the precise amount of his debt and no more; whereas, had he acted in a more generous spirit towards two brothers in distress, he might have come in for a handsome present out of the proceeds of the 'Welcome Stranger.'

The 'Welcome' nugget, found at Bakery Hill, Ballarat, in Victoria, on June 15, 1858, was nearly as large as the one just described, its weight being 2217 ounces 16 dwts. It was found at a depth of one hundred and eighty feet in a claim belonging to a party of twenty-four men, who disposed of it for £10,500. A smaller nugget, weighing 571 ounces, was found in close proximity to it. After being exhibited in Melbourne, the 'Welcome' nugget was brought to London and smelted in November 1859. The assay showed that it contained 99·20 per cent. of gold.

Another valuable nugget, which was brought to London and exhibited at the Crystal Palace, Sydenham, was the 'Blanche Barkly,' found by a party of four diggers on August 27, 1857, at Kingower, Victoria, just thirteen feet beneath the surface. It was twenty-eight inches long, ten inches broad in its widest part, and weighed 1743 ounces 13 dwts. It realised £6905, 12s. 6d. A peculiarity about this nugget was the manner in which it had eluded the efforts of previous parties to capture it. Three years before its discovery, a number of miners, judging the place to be a 'likely' locality, had sunk holes within a few feet of the spot where this golden mass was reposing, and yet they were not lucky enough to strike it. What a tantalising thought it must have been in after-years, when they reflected on the fact that they were once within an arm's length of £7000 without being fortunate enough to grasp the golden treasure! Kingower, like Dunolly, from which it is only a few miles distant, is a locality famous for its nuggets. One weighing 230 ounces was actually found on the surface covered with green moss; and pieces of gold have frequently been picked up there after heavy rains, the water washing away the thin coating of earth that had previously concealed them. Two men working in the Kingower district in 1860 found a very fine nugget, weigh-

ing 805 ounces, within a foot of the surface; and one of 715 ounces was unearthed at Daisy Hill at a depth of only three and a half feet.

A notable instance of rapid fortune was that of a party of four, who, having been but a few months in the colony of Victoria, were lucky enough to alight on a nugget weighing 1615 ounces. They immediately returned to England with their prize, and sold it for £5532, 7s. 4d. The place where they thus quickly made their 'pile,' to use an expressive colonialism, was Canadian Gully, at Ballarat, a very prolific nugget-ground. There was also found the 'Lady Hotham' nugget, called after the wife of Sir Charles Hotham, one of the early governors of Victoria. It was discovered on September 8, 1854, at a depth of 135 feet. Its weight was 1177 ounces; and near it were found a number of smaller nuggets of the aggregate weight of 2600 ounces, so that the total value of the gold extracted from this one claim was no less than £13,000. As showing the phenomenal richness of this locality, it may be added that on January 20, 1853, a party of three brought to the surface a solid mass of gold weighing 1117 ounces; and two days afterwards, in the same tunnel, a splendid pyramidal-shaped nugget weighing 1011 ounces was discovered; the conjoint value of the two being £7500.

A case somewhat similar to one already described was that of the 'Heron' nugget, a solid mass of gold to the amount of 1008 ounces, which was found at Fryer's Creek, Victoria, by two young men who had been only three months in the colony. They were offered £4000 for it in Victoria; but they preferred to bring it to England as a trophy, and there they sold it for £4080.

The 'Victoria' nugget, as its name suggests, was purchased by the Victorian government for presentation to Her Majesty. It was a very pretty specimen of 340 ounces, worth £1650, and was discovered at White Horse Gully, Sandhurst. Quite close to it, and within a foot of the surface, was found the 'Dascombe' nugget, weighing 330 ounces, which was also brought to London, and sold for £1500.

Just as a book should never be judged by its cover, so mineral substances should not be estimated by superficial indications. A neglect of this salutary precept was once very nearly resulting in the loss of a valuable Victorian nugget. A big lump of quartz was brought to the surface, and, as its exterior aspect presented only slight indications of the existence of gold, it was at first believed to be valueless; but as soon as the mass was broken up, there, embedded in the quartz, was a beautiful nugget of an oval shape.

New South Wales, the parent colony of the Australian group, has produced a considerable quantity of gold, but not many notable nuggets. Its most famous nugget was discovered by a native boy in June 1851 at Meroo Creek, near the present town of Bathurst. This black boy was in the employ of Dr Kerr as a shepherd, and one day, whilst minding his sheep, he casually came across three detached pieces of quartz. He tried to turn over the largest of the pieces with his stick; but he was astonished to find that the lump was much heavier than the ordinary quartz

with which he was familiar. Bending down and looking closer, he saw a shining yellow mass lying near; and when he at last succeeded in lifting up the piece of quartz, his eyes expanded on observing that the whole of its under surface was of the same shining complexion. He probably did not realise the full value of his discovery; but he had sufficient sense to break off a few specimens and hasten to show them to his master. Dr Kerr set off at once to verify the discovery; and when he arrived at the spot, his most sanguine anticipations were fulfilled by the event. He found himself the possessor of 1272 ounces of gold; and he rewarded the author of his wealth, the little black boy, with a flock of sheep and as much land as was needed for their pasture.

It has been the fashion of late years to speak of the days of big nuggets as having gone for ever; but the recent finding of two such brilliant specimens as the 'Lady Brassey' and the 'Lady Loch' is a sufficient negative to such a gratuitous hypothesis. Irrespective of the old and long-established goldfields, there are still not a few undeveloped auriferous areas in various parts of Victoria, notably in the extensive Gippsland district; and in these latter it is not only possible, but, judging from analogy, highly probable that there are big nuggets lying not many feet from the surface awaiting the advent of the adventurous and lucky digger.

CAUGHT NAPPING.

IN a populous city in the west of England lately lived a Jew named Solomon Isaac. That he 'lent at usance' would seem to go without saying. He had, in fact, for many years carried on the combined business of a pawnbroker and jeweller. At the time of which we write he was in decidedly easy circumstances, and having entered upon the declining years of life, he had transferred to his son the active management of his business, and had resolved to take things comfortably. In appearance, Solomon bore but little resemblance to the conventional Hebrew money-lender. His features, as a whole, clearly denoted his extraction; but his nose lacked the significant hook, and his form was portly; while his habitual cheerfulness evinced that he was neither remarkably avaricious nor malevolent.

In the afternoon of a summer day, not many years since, Solomon was seated at his desk in that part of his establishment which was known as 'the office.' His son was away for the day. The heat was oppressive, and to an attentive observer, it must have appeared that Solomon—like Homer—occasionally nodded. Solomon was disturbed in his nap by the entrance of a stranger. He was a tall, middle-aged man, showily dressed and self-possessed. After explaining that unexpected calls had been made upon his purse, he begged that Solomon would accommodate him until the morning with a loan of ten pounds, and he proffered as security a valuable-looking diamond ring. Solomon tested the gold and scrutinised the stones, and, feeling satisfied of the sufficient value of the ring, conceded the

desired advance; whereupon, with a profusion of thanks, the stranger—who had given the name of Wilkins—took his departure.

In the morning, the son resumed his duties in the business. He also tested the ring, and, to the amazement of his father, pronounced the stones to be paste, and the value of the ring to be a fifth of the sum for which it had been pledged. Solomon again examined the stones, and was obliged to concur in his son's opinion. He was extremely mortified at having proved such an easy dupe; and felt highly indignant that an attempt should have been made to swindle him, who had grown old in the trade, and whose acuteness in business was matter of common notoriety.

It was not very long, however, before Solomon regained his usual composure of mind, and when, a little later in the day, a second stranger entered the shop, Solomon stepped forward with alacrity to serve him. The new arrival may be appropriately described as an 'elderly gentleman of respectable appearance,' and he made known to Solomon his desire to purchase 'a trifle for a present.' As he had previously inspected, from the outside, the contents of the shop window, Solomon at once placed before him for selection a considerable quantity of other jewelry. The fancy of the gentleman, oddly enough, was at last taken by some rather valuable rings. A nice ring, he thought, would answer his purpose admirably; but he was remarkably fastidious. None of the rings which he looked at would exactly suit, and it seemed to be impossible to please him, when the son fetched from the office and deposited in his father's hands the ring pledged by Mr Wilkins on the previous day. It was strange that it had not occurred to Solomon to offer this ring. Both he and his son, by an easy process of reasoning, had arrived at the conclusion that Mr Wilkins would be unlikely to relieve them of it, and they had therefore determined to sell it. On beholding this ring, the eyes of the gentleman sparkled. He fitted it on his finger, extolled its beauty, and gazed on it approvingly; yet he seemed unable to come to a decision. With the ring in his hand, he entered, apparently, into an abstruse mental calculation, and finally gave back the ring with a show of great reluctance, and an expression of regret that unless his judgment deceived him, the price must be more than he could afford. Solomon generously inquired what he would give for it, and the gentleman, after some further hesitation, diffidently suggested five pounds. With this offer Solomon promptly closed; and the gentleman left, apparently quite satisfied with his purchase.

As soon as he was fairly out of hearing, Solomon and his son exulted over their good fortune. The son, in a bantering tone, took the credit to himself for having introduced the ring; but Solomon, while appreciating his son's astuteness, was not to be deprived of the credit of having, as he said, made the best of a bad bargain.

The day, however, had yet another surprise in store. The innocent rillery in which Solomon

and his son had indulged had hardly subsided when Mr Wilkins again appeared upon the scene. With a smile of recognition, he advanced towards Solomon, and informing him that, according to promise, he had come to return the loan with which he had been favoured on the previous day, deposited the amount with his ticket on the counter, and politely asked for his ring. Solomon and his son were stupefied, and for some seconds gazed in confusion at each other. The silence was eventually broken by Solomon, who, addressing Mr Wilkins, explained that having detected that the stones were spurious, they had assumed—and too hastily, as it now appeared—that he would not return to redeem the ring, and it had therefore been sold. At this intelligence, the rage of Mr Wilkins was intense. It was evident, he said, that they were incompetent to judge of the value of the ring, which was, at least, three times as great as the paltry sum which they had lent him. For what had they sold it? Five pounds? Ridiculous! They knew that they had no right to sell property received in pledge except at the time and in the manner authorised by law; and had they possessed the right to sell his ring, how could they justify their accepting even five pounds for it, seeing that they did not believe the diamonds to be genuine? In answer to these pertinent inquiries, Solomon could only tender a humble apology for his mistake. But this, as was to be expected, was hardly sufficient; and threatening to consult his legal adviser, Mr Wilkins strode towards the door.

Solomon could not disguise from himself that it would be extremely awkward to have his character for fair dealing successfully impeached in a court of justice. He had also, as he knew, directly violated the law in two respects—first, in selling within the year allowed for redemption; and secondly, in selling privately instead of by public auction. As he reflected upon his position, his mind filled with alarm, a fact which Mr Wilkins did not fail to perceive. Solomon therefore besought him not to create unpleasantness, and expressed his readiness to make every atonement for the consequences of his error. This conciliatory attitude on the part of Solomon seemed to soften the resentment of Mr Wilkins. The ring, he said, was a souvenir, and he prized it highly on that account. But he had no desire to take undue advantage of Solomon's mistake, and would be satisfied with the money value of the ring, which, at the lowest estimate, he put at thirty pounds. It was painful to Solomon to accede to these terms, but it was clear to him that he had no alternative. He was also wise enough to perceive that, while some part of his conduct would receive the censure of many, the other part would provoke the laughter of all. He therefore doled out the thirty pounds, which Mr Wilkins leisurely gathered up, and, bidding both Solomon and his son a friendly adieu, left the shop with the air of one who felt that he was a benefactor to his race.

On the following day, Solomon chanced to be at the local railway station; and had there lingered in his mind the slightest doubt that he had been cruelly victimised, it would have been rudely dispelled when, at one of the windows of a train slowly steaming away, he descried the jubilant faces of both Mr Wilkins and the

elderly gentleman, the purchaser of the ring. Solomon's emotion at the sight, and his sense of utter helplessness, must be left to the imagination of the reader.

FINE ART IN RAILWAY CARRIAGES.

HAVING had the recent experience of travelling nearly five hundred miles on three of the principal railway lines, it becomes an easy task, if it were necessary, to compare the travelling comforts of the three systems. Two of them happen to be rivals over a part of their district, and there is not much variety to choose from in the dirty cushions of the third-class carriages. On the score of official courtesy and punctuality there is nothing wanting in any of the three lines; but I was agreeably surprised, as I selected a compartment in a waiting train at the Liverpool Street Station of the Great Eastern Railway, to find that I was surrounded by some charming works of art; and being ultra-curious, I went the whole length of the long train, and found that nearly every carriage had been decorated in the same artistic manner.

Instead of those dreary advertisements connected with ironmongery, insurance, babies' food, and a host of other things which the travelling public are forced to look at, or shut their eyes to escape the painful obtrusions, in the train in question both sides of each compartment were elegantly fitted up, just under the parcel rack, with a mahogany case, in fact a specially constructed picture-frame, containing a photographic series of buildings, mediæval and modern; of scenery, artificial and natural; of life, in the pretty seclusions of the country, and of the more extended seaside. Though I was travelling at the rate of one penny per mile, yet I was seated in a well-appointed carriage with cushioned comforts equal to any ordinary chair, having no trouble about the small parcels, and enjoying the proffered beauties all around the carriage sides. Less than twenty years ago and over the same rails, just before the banishment of those remarkable and perfectly open passenger carriages like the modern bullock-wagons, I undertook one short ride on a frosty morning so as to thoroughly recognise and realise whatever advantages that method of open-air travelling possessed. Things have improved since then even to the value of railway stock, which to-day stands at sixty-six instead of forty something. *Punch* suggested and cartooned the binding of a director (Prometheus-like) to the boiler of every engine, as a probable antidote to the regularity of accidents. The prevalent policy now universally entertained by directors is the old one of prevention being better than cure, especially when one material part of the cure signifies heavy damages.

Being the sole occupant of a compartment during a continuous run of seventy miles, I had sufficient opportunity for examining every picture, and formed a favourable opinion of this new departure in railway art. The presence of such beautiful pictures will be certain to have a refining effect on the different classes of travellers, for who would ever think of destroying or injuring so much beauty? On one of the other main lines I had just travelled by, the only literature in one carriage was the brief announcement

'5 seats,' which had been still further abbreviated by some wandering iconoclast into '5 seats.' But it will be a surprising thing if any but a Bedlamite can injure the travelling things of beauty, although the sight costs nothing. The photographs are designedly of a character to illustrate the several and varied features of the district served by the Great Eastern Railway, which includes several cathedrals, abbeys, and other ecclesiastical edifices, many ancient and modern buildings, and certainly some delightful examples of still-life amongst the Norfolk broads and river system. The pictures will initiate many a conversation, and ought to provoke closer observation of the works of nature and art with which East Anglia abounds. The project thus commenced is one deserving of imitation and general adoption. It is a very simple arrangement. A piece of polished mahogany is divided into three principal parts, the openings for the pictures being sufficiently large to hold two photos, these of course being protected by glass. On one side of the compartment there were the following four large pictures, eleven inches by seven: Yarmouth Beach, evidently an instantaneous photo of a very busy scene; Lincoln Cathedral; Ely Cathedral and Palace, a winter scene; and Ditton Church with the River Cam. Two round pictures, six inches across, are Ely Cathedral from the river, and Thorpe Reach near Norwich, with a wherry in full sail. Two other excellent views of Ely Cathedral and the east end of Lincoln Cathedral complete this series.

Opposite to me are Geldeston Lock and the River Waveney, in Norfolk—an exquisite rural scene, showing two wooden bridges, well known to the pedestrian amongst the Waveney marshes; the west front of Lincoln Cathedral; and another of the Palace ruins at Lincoln. Two round ones represent Rockland Broad with its gigantic reeds and rushes, a special example of still-life; and another of the Park at Yarmouth with two inevitables, probably girls this time, much interested in being taken in the very middle of a gravel path; and lastly, Lowestoft Beach. Each picture has its designation neatly printed beneath, and nothing is needed but an appreciative public, who with this new order of art, enterprise will not only travel, but change carriages oftener than usual, in order to have the full benefit of change of compartments, and therefore of change of scenery, for no two carriages are decorated alike. The irksomeness of being pent up hour after hour at once becomes one degree less; and as there are some individuals who can even see some charms in a railroad, the enlightened and spirited policy of the Great Eastern Railway will enhance the pleasures of a railway journey very greatly in their estimation.

THE DOTY LIGHT.

The rapid development of the oil industry has been closely followed by numerous inventions aiming at improvements in its adaptation for purposes of illumination. One of the latest of these, known as the Doty Light, from the name of its inventor, Captain Doty, has already given results promising well for the future. The design and construction of the new light will be readily understood: it consists essentially of a galvanised

iron cylinder some two feet high, more or less, according to the required capacity, by eighteen inches in diameter, which forms the reservoir for the oil. On the top of this cylinder is placed the burner. Compressed air, up to a pressure of from ten to fifteen pounds per square inch, is forced into the reservoir by means of a hand-pump attached to it, a gauge being provided to register the pressure. A tube, starting from near the bottom of the cylinder, is formed into a spiral above it, and then again doubling downwards, winds as a second spiral inside the first coil, and terminates at the bottom of the double coil, where its orifice constitutes the burner.

The coil having been heated for five minutes by burning a little oil placed in asbestos in a saucer beneath, oil from the cistern is admitted. Driven by the force of the compressed air in the reservoir, it passes through the heated coil, becomes at once vaporised, and igniting at the burner, issues in a brilliant flame some three feet in height. Once started, the Doty Light will burn for some thirteen hours, till, in fact, the oil in the reservoir has become exhausted, nothing more being required than a few strokes of the air-pump every two or three hours, to maintain the pressure necessary to force the oil through the coil. The consumption of oil is estimated to average three-quarters of a gallon per hour.

Three sizes of the Doty Light are being placed on the market—three hundred, five hundred, and one thousand candle-power; whilst its inventor claims for it the numerous advantages accruing from its being self-contained, self-generating, and portable.

From trials recently carried out, the new light has shown itself to be well suited for the illumination of girder-yards, bridge-building and engineering shops, docks, harbours, goods-yards, coaling stations, tunnel-works, pitheads, quarries, mines, and generally all places where brilliant illumination, without dark shadows, is required at moderate cost and without elaborate preparation.

TO THE SINGER.

SISTER, the soul that wakes in thee
Hath in it something of the spring,
What time the sunny breezes swing
The daffodil beneath the tree;
I seem to sit beside the sea,
And hear a spirit in thee sing.

Thy voice makes many a pleasant place
To rest in, many a fragrant spot;
Blue eyes of the forget-me-not,
The charm of wistful maiden ways,
Bring back a hundred yesterdays
Of song, that may not be forgot.

If at an hour when storm-winds sway
The clouds through heaven from pole to pole,
The passion in thee seems to roll
In music to the Far-away,
Listen within thyself, and say:
'It is the soul, it is the soul.'

INUNDATIONS ON THE PLANET MARS.

Most people are more or less interested in the affairs of their neighbours. With some, this interest is confined to their street. With others, the chief gossip does not travel beyond the small circle of the country town or parish. The number of people, however, labouring under these limitations of time and place is not so great as it has been; and with improved means of communication, other nations have become our neighbours, and the affairs of the globe our subject for small-talk. But even this is not enough. We must set our fancies to work on other worlds, revealed in vague yet attractive detail to the larger eye of our telescopes; and the caterer for the public ear must now mingle tales of the doings of 'lunatics'—a suggestive title for the explorers of the moon now famous in fiction—with the latest scandal of the 'court' and the alley. So has the world grown, and our horizon of curiosity extended.

But, in sober earnest, we may well take interest in a neighbouring planet. The crowning evidence of the truth of the modern astronomy, in so far as it views our earth and her sister planets as the ever-circling attendants of the sun, came when Galileo caught his first glimpse of the miniature system formed by Jupiter and his four satellites. How great a step was then taken, and what new conceptions of our history and destiny made possible, we are only beginning to see. In the moon we not only see a changing luminary, but a 'face which is a book wherein a man may read strange matters.' The study reveals much to enlighten us as to the past and future of our own small world; while each planet, at least of those nearer to us, has its quota of information to give. Among these, perhaps the most popularly and humanly interesting is the planet Mars, regarding which we propose to give our readers some information which may be of general interest. This little world, about half the size of our own, and at present concealed almost entirely in the long summer evening light, is better known and understood by astronomers than any other, and,

by a strange coincidence, presents features in some points so like those which our earth would exhibit if similarly viewed, that it is hardly possible to avoid the conclusion that it is habitable, if not inhabited, by beings somewhat like ourselves. It was, then, with more than mere scientific interest that the astronomical world received the startling report, recently sent out on high authority, that a considerable part of the planet's surface had been engulfed in its waters. Our readers will probably be interested to know on what general, as well as special, evidence this report is founded, and what amount of weight is to be attached to it. How do we know there are oceans in Mars to engulf, and continents to be engulfed by them? And what in this case has led to the belief in some such catastrophe?

Small as the planet's disc appears to our vision, it can be mapped in many details with perfect accuracy, though, perhaps, if our readers were favoured with a glimpse of its disc through a powerful telescope, they would not feel inclined to grant this. Probably, their first feeling would be either that the telescope was bad, or the artists and engravers of the planet sad deceivers. Indeed, most of the published representations of this planet are miserable failures. Yet the delineator is not altogether to blame for this. The markings of the planet are in most cases so delicate that long practice is necessary to trace them, and it is impossible to represent them so as to be visible at all in an engraving without considerably adding to their distinctness.

But as the observer's eye grew accustomed to the peculiar conditions of telescopic vision, he would gradually perceive that the planet's disc was marked with faint blue and white on a ruddy ground. Probably this is about all he would see without much practice. To the astronomer, however, these blue and white markings present distinct outlines and easily recognisable shapes. He is quite familiar with them, for they do not change their form or position. The alterations in successive drawings of the planet have not been due to change in these markings, but to

additional details revealing themselves to more powerful telescopes and more patient scrutiny. The chief of them are all named and charted on the same principles as the continents and oceans of the earth.

Are they, then, seas and inlets, bays and gulfs, polar ice-caps and glaciated islands? The cautious astronomer will only answer, 'Most probably.' Let us see what can be said in support of this answer.

The planet has an atmosphere, by early observers supposed to be very extensive, but now known to be much more tenuous than our own. As a consequence of this tenuity or thinness, atmospheric pressure there would be between one-seventh and one-eighth of ours, and the Martian air would be less compressed about the surface of the planet, as its smaller mass and diameter would alter most materially the action of gravity upon it. Calculation in this is confirmed by observation, for we see the features of the planet far more distinctly than we would see the oceans of earth through an air laden with dust and vapour such as that of our world. Moreover, in the Martian air there is water-vapour, which must evidently arise from some watery expanse on the surface; and so, very naturally, astronomers regard the blue markings as oceans, and the brilliant white spots as ice or snow. Two of the most distinct coincide with the north and south poles, and can therefore scarcely be regarded otherwise than as polar accumulations of these chilly materials. There is a general consensus of opinion among observers that this is the case. Oceans and continents imply rivers and lakes; snow implies rain and dew. So that, on the surface of Mars we would be at home, so far as these surroundings of our life are concerned. We should, however, if Scotch, lack the clouds to which we are so accustomed, for the Martian air is singularly clear, and apparently calm also.

The Martian day is almost the same in length as our own; and it may provoke perhaps some incredulity when we state that its length is known to within *one-fiftieth of a second*, such accuracy have astronomers' time-measures attained. It is given by the latest authority as 24 hours 37 minutes 22·735 seconds. The Martians must, then, dine and sleep pretty much as we do. But their sowing and reaping will be very different. Mars has an orbit much larger than ours to traverse in completing its year, and goes only at the moderate mean speed of 53,000 miles per hour, as against the Earth's 65,000. The year there will therefore be nearly twice as long as ours. This our readers may note as one very great difference. For the laws of vegetable, and probably of animal, life must be strikingly different in the ruddy planet from those ruling on earth. Vegetable growth is probably much slower, and changes dependent on the seasons all less violent than with us. In fact, as we consider the matter more minutely, we see that, while there is what may be styled an *elementary* resemblance between Mars and the Earth, life on the one will differ greatly from life on the other. The long year, with its slow changes of temperature, will moderate the causes of aerial disturbance, and these causes will operate in an atmosphere very much less dense. The storms and breezes

will thus be literally much *lighter* than with us. Yet so far this will be balanced by the generally frailer structure of plants and animals. Our trees are strong because they have to sustain the weight of their umbrageous heads, as well as resist the impact of our denser air as it sweeps over them in the storms of winter. With a weight of material only one-seventh, the Martian trees and plants are probably less firm in structure, and so are proportioned in strength to the feebler Martian winds.

It may also be thought that the Martian sailors, if there be such, will have less speedy voyages than ours. The resistance to a vessel's motion depends of course on the density and structure of water, which do not depend on gravity. So that with a lighter wind to fill his sails, the Martian will have as dense a fluid beneath his vessel. But here the same kind of compensation comes in. His ship will only weigh one-half as much as one of ours, even if made of the same material. But for his purposes far less strength will suffice, and, as we have seen, if he builds of wood, he will get light material to his hand. His vessel will literally 'skim the seas,' and will find ample power in the feeble breeze. The tenuity of the Martian air will also trouble housewives. Their pots, if not closed steam-tight, will boil when the water is almost lukewarm!—certainly at a temperature far below what we find necessary for cooking purposes.

We have already remarked on the long Martian seasons. Owing to the fact that the planet's path takes it much nearer the sun in one part than in another, these seasons are curiously unequal. This inequality conspicuously favours the northern hemisphere. In fact, the summer half of the year there is three hundred and seventy-two days in length, while to the winter half is only given two hundred and ninety-six. Exactly the reverse is the case in the southern hemisphere, the winter there being long and the summer short. Yet on such a small globe it will be easy for the inhabitants to change their hemisphere according to taste, and by travelling, to enjoy any of the seasons they like in continual freshness. The distribution of land and sea will also favour this. The Martian seas are really mere lakes, channels, and inlets. Their arrangement is peculiar and interesting. A broad belt of continents girdles the equatorial region of the planet. These continents are bordered towards the poles by narrow strips of sea, which are unfrozen, and apparently continuous round the whole of the globe. One or two large masses of water break up the continental belt, and these are united to one another by a perfect maze of narrow channels, turning and twisting in all directions, and opening into numerous inlets. These inlets are sometimes very long. The one called Bessel Inlet extends over nearly ninety degrees of Martian latitude—that is, about a quarter of the way round the globe of the planet. The bottle shape of these long gulfs is a very curious feature. Most of them enter by a very narrow neck, and then expand suddenly or gradually into a large oval bay. If the border of these consists of cliffs and mountains, the Martians will be highly favoured in the matter of scenery. To pass through a narrow cliff-bound channel into the expanse of one of these vast bays, if

surrounded by wooded hills, would be a beautiful voyage indeed.

This *bottle* shape extends even to the oceans, in which there is not in any case a great expanse of surface. Dawes Ocean largely consists of two great bag-shaped bays, and De la Rue Ocean is the same in structure. These of course are named after eminent astronomers, as are almost all the chief features of the planet. By these arrangements, our readers will see that the facilities on Mars for water-carriage are very great; while, of course, railway carriage and construction must be, if attempted, proportionately difficult. The Martian voyagers will have no long weary days on the expanse of ocean; on the contrary, varied and beautiful minglings of land and sea will continually refresh their vision. A recent discovery has apparently somewhat extended this grand network of waterways. In 1877 the planet was in a peculiarly favourable position for observation, and a perfect reticulation of faint markings was seen by Schiaperelli, of Milan Observatory. These covered the larger continents, and were by him named 'canals,' though to be visible at this distance they must be enormous in size. Their reality has since been doubted, but may be regarded as now confirmed. Moreover, they are sometimes doubled, a twin canal appearing parallel to the first at a distance of several hundred miles. This doubling is considered by Schiaperelli to depend in some way on the change of the Martian seasons. Though still called canals, they are hardly now regarded as such; indeed they form one of the most curious and inexplicable features of the planet. Perhaps all its features may be regarded as difficult of explanation. We have given our readers only what is the most probable view of the case. Certainty cannot yet be said to be attained on any points, except the tenuity and clearness of the Martian air, and the presence in it of water-vapour. Still no very strained inference is involved in the rest.

But there is one fundamental fact about Mars which thoroughly baffles explanation. The planet is forty-eight million miles farther from the sun than the Earth. It will receive less than half the light and heat that we do. Its tenuous air will not retain the solar heat as our denser atmosphere does. The condition of the general surface will be more like that of some lofty mountain top near our arctic circle, than that of our fertile plains in the temperate zone. It should be clothed with almost constant ice and snow. Yet the north and south polar ice-caps on Mars are very small—far smaller in proportion than those of the Earth. What strange cause maintains the warmth of his surface? This is one of the problems awaiting solution by the astronomy of the future. When solved, it will throw light on many other perplexing cosmical questions.

Our readers will now be in a better position to understand the evidence offered in proof of the vast inundation to which we have referred. Mars has been lately favourably situated for observation, being near the Earth, and though his position low down in the sky prevents full advantage being taken of his proximity, yet in May and June he was an object of special regard. A portion of the land-surface of the planet—named 'Libya' in the principal charts—

has appeared darker than usual, so much so, to some observers, as to seem blended with the neighbouring waters. The 'Tyrrhenian Sea' has also seemed paler in tint, as if reduced greatly in depth. From what we have said of the feeble gravity on the planet, it is evident that the structure of the rocks and soil, as well as that of the trees and plants, must be greatly less massive than with us; indeed, a certain *porosity* of surface structure would seem probable, and this, taken with the fact that, as a whole, Mars is only about half as dense as our earth, would render such an event as the subsidence of a continent not so very improbable. But our readers must remember that such a structure infers feebler forces to disintegrate and destroy. On such a globe, the 'war of elements' could not rage very fiercely at any time. It is indeed not likely that on any inhabited globe the conditions of life are really so precarious as we might imagine. Dr Terby, of Louvain, a very skilful observer, is not inclined to favour the inundation theory, attributing the slight changes which have been confirmed rather to the very oblique view of the regions involved at present offered to astronomers by the position of the Martian globe. Further accounts from such skilful observers are needed before the matter can be seriously considered.

If undistracted by devouring waters, the Martians will be able to enjoy a continued celestial spectacle of a very curious kind. They are, as our readers must be aware, furnished with two small moons, one of which completes its orbital course in about seven hours and a half. It will rise or set three or even four times in a single day, and for the Martian seamen will do the part of a chronometer. Indeed, clocks will be at a discount there, for with little cloudy weather, and a celestial body crossing the heavens in seven or eight hours, it will always be possible to tell the time with considerable exactitude.

Thus we have considered our next neighbour among the planets, the likeness of which to the Earth is obvious, but its differences from it being still more prominent.

THIS MORTAL COIL

CHAPTER XLII.—FACE TO FACE.

THAT hint sobered him. He roused himself to actual action at last. It was now eight, and Elsie was off by the 9.40! Too many thoughts had crowded him too fast. That single hour enclosed for Hugh Massinger a whole eternity.

He rose and dressed himself with all expedition, remembering—though by an afterthought—for decency's sake to put on his black cutaway coat and his darkest trousers—he had with him none black save those of his evening suit—and to approach as near to a mourning tie as the narrow resources of his wardrobe permitted. But it was all a hollow, hollow mockery, a transparent farce, a mere outer semblance: his coat might be black, but his heart was blithe as a lark's on a bright May morning. He drew up the blind: the sun was flooding the bay and the hillsides with Italian lavishment. Flowers were gay on the parterres of the public garden. Who could pretend to be sad at soul on a day like this, worthy of whitest

chalk, when the sun shone and flowers bloomed and Elsie was alive again? Let the dead bury their dead. For him, Elsie! for Elsie was alive again. He lived once more a fresh life. What need to play the hypocrite, here, alone, in his own hired house, in the privacy of his lonely widowed bedchamber? He smiled to himself in the narrow looking-glass fastened against the wall! He laughed hilariously. He showed his even white teeth in his joy: they shone like pearl. He trimmed his beard with unwonted care; for now he must make himself worthy of Elsie. 'If I be dear to some one else,' he murmured, with the lover in *Maud*, 'then I should be to myself more dear.' And that he was dear to Elsie, he was quite certain. Her love had suffered eclipse, no doubt: Warren Relf, like a shadow, had flitted for a moment in between them; but when once he, Hugh, burst forth like the sun upon her eyes once more, Warren Relf, pale and ineffectual, would hide his diminished head and vanish into vacancy.

'Warren Relf! That reptile—that vermin! Ha, ha! I have you now at my feet—my heel on your neck, you sneaking traitor. Hiding my Elsie so long from my sight! But I nick you now, on the eve of your victory. You think you have her safe in the hollow of your hand. You'll carry her off away from me to England! Fool! Idiot! Imbecile! Fatuous! You reckon this time without your hostess. There's many a slip 'twixt the cup and the lip. I'll dash away this cup, my fine fellow, from yours. Your lip shall never touch my Elsie's. Nectar is for gods, and not for mudlarks. I'll bring you down on your marrow-bones before me. You tried to outwit me. Two can play at that game, my friend.'—He seized the bolster from the bed, and flinging it with a dash on the carpetless floor, trampled it in an access of frenzy under foot, for Warren in effigy. The relief from his strain had come too quick. He was beside himself now with love and rage, mad with excitement, drunk with hatred and joy and jealousy. That creature marry his Elsie, forsooth! He danced in a fever of prospective triumph over the prostrate body of his fallen enemy.

Warren Relf, meanwhile, by himself next door, was saying to himself, as he dressed and packed, in sober sincerity: 'Poor Massinger! What a terrible time he must be having, down there alone with his dead wife and his accusing conscience! Ought I to go down and lighten his burden for him, I wonder? Such remorse as his must be too heavy to bear. Ought I to tell him that Elsie's alive?—that that death at least doesn't lie at his door?—that he has only to answer for poor Mrs. Massinger?—No. It would be useless for me to tell him. He hates me too much. He wouldn't listen to me. Elsie shall break it to him in her own good time. But my heart aches for him, for all that, in spite of his cruelty. His worst enemy could wish him no harm now. He must be suffering agonies of regret and repentance. Perhaps at such a moment he might accept consolation even from me. But probably not. I wish I could do anything to lessen this misery for him.'

Why did no answer come from Elsie? That puzzled and surprised Warren not a little. He had begged her to let him know first thing in the morning whether she could get away by the 9.40.

He wondered Elsie could be so neglectful—she, who was generally so thoughtful and so trustworthy. Moment after moment, he watched and waited: a letter must surely come from Elsie.

After a while, Hugh's access of mania—for it was little less—cooled down somewhat. He began to face the position like a man. He must be calm; he must be sane; he must deliberate sensibly.

Elsie was going by the 9.40; and Warren Relf would be there to join her. 'I'll meet you at the station at the hour you mention.' But not unless Relf received that letter. Should he ever receive it? That was the question.

He glanced once more at the envelope—torn hastily open: 'WARREN RELF, Esq., Villa della Fontana (Piano 3'). Then Warren Relf was here, in this self-same house—on this very floor—next door, possibly! He would like to go in and wring the creature's neck for him!—But that would be rash, unadvisable—premature, at any rate. The wise man dissembles his hate—for a while—till occasion offers. Some other time. With better means and more premeditation.

If he wrung the creature's neck now, a foolish prejudice would hang him for it, under all the forms and pretences of law. And that would be inconvenient—for then he could never marry Elsie!

How inconsistent! that one should be permitted to crush under foot a lizard or an adder, but be hanged, by a wretched travesty of justice, for wringing the neck of that noxious vermin! He stamped with all his might upon the bolster (*vice* Warren Relf, not then producible) and gnashed his teeth in the fury of his hatred. 'Some day, my fine fellow, it'll be your own turn,' he muttered to himself, 'to get really danced upon.'

Happy thought! If he let things take their own course, Relf would probably never go down to the station at all, waiting like a fool to hear from Elsie; and then—why, then, he might go himself and—well—why not?—run away with her himself offhand to England!

There, now, would be a dramatic triumph indeed for you! At the very moment when the reptile was waiting in his lair for the heroine, to snatch her by one bold stroke from his slimy grasp, and leave him, disconsolate, to seek her in vain in an empty waiting-room! It was splendid!—it was magnificent! The humour of it made his mouth water.

But no! The scandal—the gossip—the indecency! With Winifred dead in the room below! He must shield Elsie from so grave an imputation. He must bide his time. He must simulate grief. He must let a proper conventional interval elapse. Elsie was his, and he must guard her from evil tongues and eyes. He must do nothing to compromise Elsie.

Still, he might just go to the station to meet her. To satisfy his eyes. No harm in that. Why give the note at all to the reptile?

But looking at it impartially, the straight road is always the safest. The proverb is right. Honesty appears to be on the whole the best policy. He had tried the crooked path already, and found it wanting. Lying too often incurs failure. Henceforth, he would be—reasonably and moderately—honest.

Excess is bad in any direction. The wise man will therefore avoid excess, be it either on the side of vice or of virtue. A middle course of external decorum will be found by average minds the most prudent. On this, O British ratepayer, address yourself!

Hugh took from his portmanteau an envelope and his writing-case. With Elsie's torn envelope laid before him for a model, he exercised yet once more his accustomed skill in imitating to the letter—to the very stroke, even—the turns and twists of that sacred handwriting. But oh, with what different feelings now! No longer dead Elsie's, but his living love's. She wrote it herself, that very morning. Addressed as it was to Warren Relf, he pressed it to his lips in a fervour of delight and kissed it tenderly—for was it not Elsie's?

His beautiful, pure, noble-hearted Elsie! To write to that reptile! And 'Dearest Warren,' too! What madness! What desecration! Pah! It sickened him.

But it was not for long. The sun had risen. Before its rays the lesser Lucifers would soon efface themselves.

He rang the bell, and after the usual aristocratic Italian interval, a servant presented himself. Your Italian never shows a vulgar haste in answering bells. Hugh handed him the letter, readdressed to Warren in a forged imitation of Elsie's handwriting, and asked simply: 'This gentleman is in the *pension*, is he?'

Luigi bowed and smiled profusely. 'On the same floor; next door, signor,' he answered, indicating the room with a jerk of his elbow. The Italian waiter lacks polish. Hugh noted the gesture with British disapproval. His tastes were fine; he disliked familiarity.

On the same floor—as yet unchoked! And he couldn't get at him. Horrible! horrible!

For Elsie's sake he must assume some regret for dead Winifred.

So he told the landlady with a sigh of sensibility he had no heart that morning to taste his breakfast. He would go and stroll by the seashore alone. Everything had been arranged about the poor signora. 'What grief!' said the landlady. 'Look you, Luigi, he can eat nothing.'

At a shabby *trattoria* in the main street, he took his breakfast—a sloppy breakfast; but the coffee was good, with the exquisite aroma of the newly roasted berry, and the fresh fruit was really delicious. On the Mediterranean slope, coffee and fresh fruit cover a multitude of sins. What could you have nicer, now, than these green figs, so daintily purpled on the sunny side, and these small white grapes from the local vineyards with their faint undertone of musky flavour? The olives, too, smack of the basking soil; 'the luscious glebe of vine-clad lands,' he had called it himself in that pretty song in *A Life's Philosophy*.—He repeated the lines for his own pleasure, rolling them on his palate with vast satisfaction, as a connoisseur rolls good old Madeira:

My thirsty bosom pants for sunlit waters,
And luscious glebe of vine-clad lands,
And chanted psalms of freedom's bronze-cheeked
daughters,
And sacred grasp of brotherly hands.

That was written before he knew Winifred! His spirits were high. He enjoyed his breakfast. A quarter to nine by the big church clock; and Elsie goes at 9.40.

He strolled down at his leisure to the station with his hands in his pockets. Fresh air and sunshine smiled at his humour. He would have liked to hide himself somewhere, and 'see unseen,' like Paris with the goddesses in the dells of Ida; but stern fact intervened, in the shape of that rigid continental red-tape railway system which admits nobody to the waiting-rooms without the passport of a ticket. He must buy a ticket for form's sake, then, and go a little way on the same line with them; just for a station or two—say to Monte Carlo.—He presented himself at the wicket accordingly, and took a first single as far as the Casino.

In the waiting-room he lurked in a dark corner, behind the bookstall with the paper-covered novels. Elsie and Relf would have plenty to do, he shrewdly suspected, in looking after their own luggage without troubling their heads about casual strangers. So he lurked and waited. The situation was a strange one. Would Elsie turn up? His heart stood still. After so many years, after so much misery, to think he was waiting again for Elsie!

As each new-comer entered the waiting-room, his pulse leaped again with a burst of expectation. The time went slowly: 9.30, 9.35, 9.36, 9.37—would Elsie come in time for the 9.40?

A throb! a jump!—alive! alive! It was Elsie, Elsie, Elsie!

She never turned; she never saw. She walked on hastily, side by side with Warren, the serpent, the reptile. Hugh let her pass out on to the platform and choose her carriage. His flood of emotion fairly overpowered him. Then he sneaked out with a hand-dog air, and selected another compartment for himself, a long way behind Elsie's. But when once he was seated in his place, at his ease, he let his pent-up feelings have free play. He sat in his corner, and cried for joy. The tears followed one another unchecked down his cheeks. Elsie was alive! He had seen Elsie!

The train rattled on upon its way to the frontier. Bordighera, Ventimiglia, the Roya, the Nervia, were soon passed. They entered France at the Pont St-Louis.

Elsie was crying in her carriage too—crying for poor tortured, heart-broken Winifred. And not without certain pangs of regret for Hugh as well. She had loved him once, and he was her own cousin.

And all the time, Hugh Massinger, in his own carriage, was thinking—not of poor dead Winifred; not of remorse, or regret, or penitence; not of his sin and the mischief it had wrought—but of Elsie. The bay of Mentone smiled lovely to his eyes. The crags of the steep seaward scarp on the Cap Martin side glistened and shone in the morning sunlight. The rock of Monaco rose sheer like a painter's dream from the sea in front of him. And as he stepped from the carriage at Monte Carlo station, with the mountains above and the gardens below, flooded by the rich Mediterranean sunlight, he looked about him at the scene in pure æsthetic delight, saying to himself in his

throbbing heart that the world after all was very beautiful, and that he might still be happy at last with Elsie.

(To be continued.)

SCOTSMEN AND THE RIVER PLATE.

THE design of this paper is partly to illustrate the industry and perseverance of Scotsmen, and partly to describe scenes on the South American coasts, or in the *estancias* (farmhouses), in which business is carried on very thrivingly. In truth, one might linger at Rio de Janeiro and Monte Video and pick up something in the way of information, which, if retailed in a popular sense, would be very interesting from the point of view of suggestive pabulum. The harbour of Rio, for example, would make an artist rampant with enthusiasm, seeing that it is surrounded by innumerable palm-clad islands, while lofty mountains are reflected in the land-locked and glassy waters. Natural surroundings apart, another inducement for a brief stay here would be the pleasure of having a chat with the Emperor, who is always to be met in early morn taking his constitutional, just as an old and hearty farmer might do, towards some one or other of the suburbs bordering his capital. He is always glad to have a chat with any European who has a respectable card in his pocket, or who can refer to some one or other of the merchants at Rio as having a knowledge of his *locus standi*. On these occasions the Emperor is unattended, save by a valet, who is dressed in a green coat, —the national colour—accompanied by a faithful collie dog, now a little grizzled, which he took home with him on his last visit to Europe. He will chat freely of the resources of his country, and point out how the surplus labour of Great Britain might be benefited by taking up the untilled lands in his empire, which are only awaiting labour to make them reproductive.

Then, if the visitor should be inclined to take another stroll, he might explore the mysteries of the Corcovada. This is a small steep mountain, from which, when surmounted, a view of the harbour and neighbouring country can be obtained. The approaches are of a zigzag kind; and the rays of the sun are mitigated by trees whose branches, covered with creepers, orchids, and vegetable parasites of all descriptions, constitute a natural network which it is pleasing to contemplate. Here, animated nature is in great activity; and the hearer is never likely to forget the curious hum and clatter that come upon the breeze from myriads of beetles, bullfrogs, and flying insects.

Should one elect to pursue the journey by way of Monte Video—which, in these days of good maps and extended information, it is almost needless to say is the capital of Uruguay, though the writer has met with many instances in which 'globetrotters' have mixed up the affairs of this republic with those of the Argentine confederacy, and that especially in connection with the exportation of wool and frozen meat to European markets—the experiences which will be encountered will not be regretted. The coast lies low in one unbroken plain, with here and there ranges of hills in the far-off distance; while the land is thickly interspersed with cattle and horses, with

hardly a tree to shelter them from the rays of what is very much like a tropical sun. What we at home should call farmhouses are built bungalow-fashion, and from a distance look as though they had been stuccoed with bleached oyster-shells. Indeed, here, as everywhere else in tropical climates, the dwellings of the people present a whitewashed appearance, and this probably for the reason that that colour is a non-conductor of heat; but whether the proverbial black of the old country is equally effective in keeping out the cold is a question which may be left for experts to determine. This province is as much favoured by the waters of the River Plate as is that of the Argentine Republic. Monte Video—so called from an insignificant and solitary hill which overlooks the city—may be said to be, as South American cities go, and having regard to the fact that its drainage is imperfect, a clean, well-built town, with a few attractive buildings laid out on the American plan; while business men can hie them hither or thither at moderate fares, in tram-cars, which are drawn by four horses. There are a few Scottish merchants there who are always ready to give a welcome to any traveller from the old country, and to give him the 'run' during his stay of a comfortable clubhouse, provided with papers, periodicals, billiard-tables, and a bar where some very good examples of the 'barley bree' can be obtained.

Monte Video has a handsome square with a fountain fringed by trees, and no end of representatives of the floricultural kingdom. A military band plays here from eight to ten every night. To say sooth, however, its music is not of the character a European is accustomed to, for the dominating noise emanates from a pair of cymbals and a big drum, the monotony of the latter being as repulsive as the tom-toms of the Dark Continent. But discords notwithstanding, there are damsels there with dark piercing eyes and sunburnt visages, dressed in their best attire, and love has its conquests in South America as much as in Europe. If for no other experiences than those recounted, Monte Video would be worth a visit by any traveller whose destination was the Argentine Republic. If he had time at his disposal, he might run out of town and get some experience of the hospitality extended at the *Hotel del Prado*, which may be described as a miniature *Star and Garter*; or train could be taken to Santa Lucia, which is noted for its picturesque surroundings, and its flat-roofed villas, gaily decorated with the brightest colours; while the gardens are rich in statues and variegated glass at every coign of vantage. The hedges, where they exist, are formed either of aloe (or rather agave) or cactus; and the soil is both deep and rich, and being level, all kinds of agricultural machines can be employed upon it. If there are any Scottish farmers disposed to try their fortunes in this part of the world, they might do so to advantage, since land is cheap and rent moderate. As for the land, it is so productive that superphosphates, guano, or any kind of manures are not needed to produce rich harvests.

The Argentine Republic adjoins that of Uruguay, as will be gathered from the before-mentioned proximity of the River Plate to both. Owing to the facility which the water-way affords,

something considerable in the way of trade is done between the two republics. Of the two, however, the Argentine Republic is certainly the most progressive, a fact which is due perhaps as much to the wisdom of its presidents as to the pluck and enterprise of those Europeans—among whom the Scottish element is prominent—who have done so much to extend its industries. Now and again, sad tales have been heard upon the Stock Exchange of the decadence of this country in respect to its public debt; but whenever the hard dollar has been wanted to liquidate the interest thereon, the evil reports of 'bulls' and 'bears' notwithstanding, it has always been forthcoming. It will be a big country by-and-by. Even now, it runs Australia, New Zealand, and South Africa hard in the markets on this side of the equator in respect of wool, hides, horns, and skins. Numerically, it dominates every sheep-producing country in the world save the United States, since, while the flocks of Australia are reckoned at about eighty millions, of New Zealand at forty millions, South Africa from sixty-five to seventy millions, those of the Argentine Republic reach a hundred millions. As to stock, the recent bounty will doubtless give an impetus to the exportation of beef and frozen mutton. Though ten years ago the wool-trade of that country was not so profitable as that of the colonies above mentioned, yet the Scottish element has improved upon the past by the introduction of fresh blood. As time goes on and facilities of transport are afforded—by reason of the closer proximity of that country to the markets of Europe than South Africa or the colonies at the antipodes—there can be no doubt that the producers of this part of the world will make headway, as respects the export of wool, hides, and horns, as well as cereals, the growth of which is rapidly extending throughout the province. It is true that at present Buenos Ayres is inaccessible within ten miles to any ocean-going steamer, and that the lighterage to-day is equal to one-half of the freight to Europe; but this is a difficulty which a progressive government cannot afford to ignore, and which is sure to be overcome. With respect to wool, the Scottish farmers on the Plate are very anxious to improve its quality, so that it may hold its own with the best samples from Australia, and take a leading place among the choicest brands that are now in demand on the wool exchange in Coleman Street. With this object, the best possible strains have been imported by them from America and Europe.

At this point it may be mentioned that on many of the *estancias* owned by Scotsmen may be seen the national collie, who towers grandly over the Spanish lurcher, and does not appear to have deteriorated much by change of climate.

With regard to the frozen-meat industry, this would go well if only the steamship Companies trading to South America would fit up vessels with the necessary freezing machinery. Scotsmen there are very emphatic on this point; and if the existing Companies who trade there do not meet their conveniences, they are rich enough to offer bonuses to Companies who will. Given proper appliances, five million sheep and lambs could be annually exported to Great Britain without making any appreciable difference in the stock. The reader will easily realise what this means from the point

of view of our food-supply and the realisation of dividends on capital. Already the imports of frozen meat from this republic top those of any of our colonies, and, as has been said, it only requires further carrying facilities to be extended indefinitely. In 1887 the import of meat from that country into London and Liverpool amounted to 641,266 carcasses—London absorbing 242,903, and Liverpool 398,363. Looking, however, to the fact that meat to any extent can be conveyed from that country to the British markets in twenty days, it is but reasonable to assume that science and capital will discover means by which that trade will be largely extended.

With respect to the wool-trade of the Argentine Republic, the writer is acquainted with a Scotsman who nursed this Hercules in its cradle, and he says there is a feeling among the growers there so to improve the staple that it shall hold its own with the best known brands of any wool-producing country in the world. Hitherto, the imports of River Plate wool into London have been but meagre in respect to bales, the chief markets for that commodity being Liverpool and Antwerp, where, indeed, most of the hides, skins, and horns are sold. A slight trade is done with America, since America does a trade with the Argentine Republic in agricultural machinery. From the point of view of endurance, however, American machinery is not so much appreciated as that imported from Scotland. Among the hides mostly sought after by tanners are the Saladero ox, the Matadero, the Grande Saladero, and the Salted Cow, since they can be converted into leather which is much approved of among those who follow industries into which the article leather enters. In respect to boots and shoes, perhaps there are thousands of people walking about London and Edinburgh who little think that their feet are encompassed with leather tanned from the hides of animals that roamed the Pampas. As showing the trade carried on between Great Britain and South America, it may be mentioned that a hundred and twenty vessels sailed to that continent in January last from ports in Great Britain, Havre, and Antwerp, freighted with manufactures of different kinds.

MRS FARQUHARSON'S NIECE.

CHAP. IV.—CHECKMATED.

I SCARCELY recognised myself in the resolute energetic girl I had become. The other two seemed to depend on me for everything, and I had roused myself to the occasion. I wrote a hurried note, and descended, bearing it in my hand unsealed. I handed it to Mr Vanburgh, whom I found dressed. A long dark cloak of Mrs Farquharson's almost entirely covered his gray dress. He wore my hat, which I had left in his room, and a dark veil. His bag stood on a chair. He would not wait for tea, he said. He asked my pardon for taking my hat.

'Oh, what does it matter, so that you escape!' I cried. 'I will accompany you to Harley, for I know that neither Mrs Farquharson nor I could rest unless we knew you had got safely away.—Do not raise any objection; I can walk back perfectly well alone.'

'You are a true friend in need, Miss Stuart,' said he with emotion. 'What we should have done without you at this time, Heaven knows, for I am quite unnerved. I am sorry uncle is not here; I should have liked to have said good-bye to him.'

We left the house, Mr Vanburgh carrying the bag concealed under the long cloak. None of the servants by good luck were about. Mrs Farquharson did not come to the door; she wished it to appear as though we had gone merely for a stroll. On my return, she would tell Mrs Glass the housekeeper that Miss Selwyn had gone.

We took down the garden path and along near to the river-side until we reached the bend of the river, which brought us outside the Manor grounds into Squire Bolden's, between which and Mrs Farquharson's there was a high hedge, the counterpart of that which bounded the Manor lands on Farmer Shiel's side. By taking this road we kept completely out of the detective's view, should he be on the outlook with his glass. A small footpath led us out on to the main road leading to Harley.

Our walk was a very silent one, for we scarce exchanged half-a-dozen words. When we reached the station, we had not long to wait. I secured Mr Vanburgh's ticket for him.

'I cannot thank you,' he said, much agitated, as he was about to step into the train: 'I will try and drop a line. Perhaps we shall yet see each other again. My aunt will tell you the whole story. Believe me, Miss Stuart, I am innocent of this charge.'

'I never doubted it. We shall long to hear from you how you get on.—Might I ask you a favour, Mr Vanburgh? It is, that you promise me to give up gambling and betting from this time.'

He suddenly stooped and imprinted a kiss on my forehead. 'Forgive me. I do promise. For your sake, I would promise anything.'

Next minute, I was standing alone with crimson cheeks waving my handkerchief as the train glided off. My thoughts were full of that kiss all the way back.

Mrs Glass coming into the room on my return, was then told of Miss Selwyn's departure. She seemed much surprised, but made no remark. That young lady's erratic movements were evidently too much for her. She was simply told Miss Selwyn had received word which necessitated her leaving at once.

It was not without some trepidation that I descended next morning to the breakfast-room. Mrs Farquharson was already seated there, calm and composed as usual. I could not help admiring her fortitude. In the midst of the meal came a ring at the door bell. Mrs Glass, being at that moment in the act of crossing the hall, herself opened the door.

'We wish to see Miss Selwyn,' said a voice, which I recognised as that of the man Jacobs.

'Miss Selwyn is not here,' replied Mrs Glass. 'She left last night before seven o'clock. She was telegraphed for to go home.' This statement she made entirely on her own authority, as nothing whatever had been said to her either regarding the mode in which Miss Selwyn had been summoned away or her destination. She had

apparently arrived at this conclusion of her own accord.

'Stuff and gammon!' cried the man coarsely. 'Where could she go? You don't catch a weasel asleep. Try that on with some other, my good woman. More likely she saw us from the window, and is in hiding.—Tell your mistress we wish to see her at once.'

Without waiting to be invited, they followed Mrs Glass into the breakfast-room. There were three of them; the third, I presume, being the man whom Jacobs had called Bob. The foremost, Jacobs, held what I supposed was the warrant in his hand.

Mrs Farquharson's presence of mind was admirable. 'May I ask the meaning of this intrusion, gentlemen?' she asked calmly. 'Mrs Glass, show these gentlemen into the front drawing-room for a few minutes. Miss Stuart and I are engaged at breakfast just now.'

They were manifestly taken aback at her coolness. 'I beg your pardon, madam; and yours too, miss,' said Jacobs; 'but our business will not wait. I have here a warrant for the apprehension of Mr Jack Vanburgh on a charge of forgery, who has been staying here these last three weeks under the name of Miss Doris Selwyn.'

Mrs Glass gave a scream, and seemed about to drop. Mrs Farquharson still preserved an unruffled front.

'Mrs Glass has already told you that Miss Selwyn is not here. I have nothing more to add, gentlemen. If you wish, you can search the house and grounds. Perhaps you will kindly relieve us of your presence, and allow Miss Stuart and me to finish breakfast.'

I never saw such an expression of baffled rage on the face of any human being as that which overspread the countenance of Jacobs. Perhaps the knowledge of his own dilatoriness made him feel worse. 'It is false!' he shouted. 'He is here! I'll bet my life.—Maybe you are not aware, madam, that in concealing this young man from punishment, you run a risk yourself,' he added ferociously.

'I am concealing no young man,' she said; 'and if I were, am not one to be intimidated by threats.—Excuse me, gentlemen, but if you do not retire, Miss Stuart and I must.'

Thereupon they went out, but not before casting suspicious glances round the room. They searched the house from top to bottom—of course with no result; and all day two of them hovered about the house and grounds, the third probably making inquiries elsewhere. I do not think they suspected me in the matter.

In the course of the day I received a letter, which was, I understood, directed to me to avoid suspicion. It contained simply these words: 'Everything arranged. To-morrow six A.M.' No signature was attached, and it bore the London postmark. This was sufficient, however, to satisfy us that all was right, and that Mr Vanburgh would by this time have sailed and the note been written by him the night before. Later on, I would get full details from my father.

Meantime, I had heard the particulars of the alleged forgery from Mrs Farquharson. 'One night about a month ago,' she said, 'old Mr Balcombe and Jack were detained in the office on business later than usual, the others having left

before them. After Mr Balscombe left, Jack noticed his cheque-book lying among some papers on his desk. He was usually very careful to keep it under lock and key. Jack picked it up and put it in the inside pocket of his coat, intending to lock it up in the safe in the other room; but having some other things to do first, finally forgot all about it. During that evening he and Mr Balscombe's nephew were out playing at billiards together, and Jack got himself rather the worse of liquor. Young Balscombe had to take him home and see him to bed. In the morning, Jack suddenly remembered the cheque-book, and on examining his pocket, found it all right where he had placed it the night before. When he got to the office, he handed it to Mr Balscombe, explaining how it came to be in his possession. Some days afterwards, Mr Balscombe discovered, on looking over his bank-book, that a sum of fifty pounds, for which he did not remember writing a cheque, had been withdrawn from his account. He called at once at the bank, and was shown a cheque for that amount purporting to be signed by himself, but which he at once detected to be a forgery. On examining his cheque-book, one cheque was found to have been torn away, counterfoil and all. He then remembered the occasion on which Jack had charge of the cheque-book as being the only time it was out of his possession. The cheque had been filled up in a strange name, but had been endorsed all right, and the money paid—so far as the teller of the bank could recollect—to a young lad of about eighteen or so, the morning Jack returned the book to Mr Balscombe. Jack was then questioned on the subject, but indignantly repudiated all knowledge of the forgery or of the cheque. He had forgotten all about the book, he said, till next morning, and consequently no one knew from him of his having it in his possession. He had not stolen it himself, and therefore the cheque must have been abstracted earlier. Mr Balscombe was furious. Although the amount was trifling, the crime was none the less.—You know the rest, Naomi. If the cheque was really taken out of the book that evening, it must have been done unknown to him, for Jack swears he is innocent, and I can believe him.

'And I also,' I said. 'But who could have done it?'

'I cannot tell,' said Mrs Farquharson sadly. 'Mr Balscombe is positive the cheque was not taken away before that day, and the very next morning it was cashed.—When Jack came here that afternoon,' she continued, 'I did not know him at first in his disguise. He told me then that Mr Bates the cashier had warned him to flee at once, for Mr Balscombe had ordered his arrest. The disguise he wore he had lately used in some private theatricals, and adopted it for safety. He was anxious to get out of the country, and until he could do so, we agreed that he should pass himself off as my niece, Doris Selwyn, for I had no acquaintances with whom I was on sufficiently intimate terms to have their daughters visiting me, as I mix so little in society.—You have never heard me mention Doris, Naomi; the subject is too painful. Three years ago she was to have been married; and on the very morning of the marriage day, her lover was killed in one of those dreadful railway acci-

dents. The shock turned her brain and nearly killed her, and she has been out of her mind ever since. The doctors, however, still hold out hope of her ultimate recovery.'

'Poor girl! Her lot has been a very sad one,' I said. 'I pity her from my heart.'

'Jack has no hope of proving his innocence,' added Mrs Farquharson after a few minutes. 'Mr Bates has been writing to him since he came here as to how matters stood, and he says his master is as wild at Jack as ever. It is curious, too, and he such a favourite with him till recently.'

I then related the incidents of the razor and the cigar-smoking which I had noticed. Mrs Farquharson could not help smiling, especially at the mention of the razor.

'I remember seeing the door ajar that morning,' she said, 'for I heard you come in, and was just ready to leave my room at the time. The Professor, who of course was in the secret, had been in Jack's room hunting for one of his books, which Jack had mislaid, and neglected to close the door after him. The draught from his own door when he closed it must have blown Jack's door further open. Jack is so careless, he had not observed it.'

More than a year slipped past. I was still with Mrs Farquharson. Mr Vanburgh, we had long ago heard, had landed at Sydney all right; and on the recommendation of Captain Gray, to whom he had confided the position in which he was placed, succeeded in obtaining a situation in a large mercantile firm, where he was doing well. He wrote home regularly to his uncle and aunt. I also had recently received a letter from him, the contents of which I need not divulge; suffice it to say that I wrote back in answer to his request, promising to go out to Sydney to him as soon as he could make a home for me; but this promise I was never called upon to fulfil, for shortly thereafter Jack himself was urgently sent for to come home by Mr Balscombe, with an offer of partnership. The mystery of the forged cheque had at last been cleared up. As the reader may have guessed, the culprit was no other than Henry Balscombe, Mr Balscombe's nephew. On his recovery from a violent attack of fever, with which he was seized about a year and a half after Jack's hurried departure, and during which attack his life was despaired of, he confessed all. He had been jealous of Jack's favouritism with his uncle. That night he took him home, in helping him off with his coat the cheque-book had fallen from his pocket to the floor. Henry Balscombe picked it up, recognised it as his uncle's, and a demon must have prompted him. He tore out one of the cheques and put back the book, filled the cheque up next morning, imitating his uncle's handwriting admirably, and finally sent his landlady's young son to the bank for the money, bidding him say, if any questions were asked, that he came from Mr Taylor, the name in which the cheque had been filled up. His plot was only too successful. He saw his rival dethroned; but he himself was far from happy, and over and over again had been on the point of confessing everything. Suspicion had never in the slightest degree attached to him, although it

was known he had been with Jack that night. It was supposed he could have had no object in purloining the cheque, even though he had known the cheque-book to have been in Jack's possession, as he had plenty of money of his own, while Jack was well known to be rather hard up.

At first, on hearing his confession, his uncle refused to have anything further to do with him. However, when Jack came home, which he did almost immediately, Mr Balscombe, on his urgent entreaty, agreed to overlook his nephew's misdeemeanour, and became reconciled to him. Henry Balscombe was very sincerely penitent; and Jack and he are now partners in business and the closest of friends. As for myself, I agree with Jack in thinking that after all there was a silver lining to the cloud, since but for that unfounded accusation, he would not have been forced to take refuge at the Manor, and I might never have been, as I am now, the happy wife of him whom first I knew as Mrs Farquharson's niece.

THE MONTH:

SCIENCE AND ARTS.

REFERRING to the extraordinary amount of rain which fell over a large part of the country in June and July last, and which in many places left the hay rotting in the fields for want of sunshine, Lord Powerscourt made, in a letter to the *Times*, a most valuable suggestion. He reminded farmers that it is quite possible to preserve this wet hay, and to turn it into winter-food for cattle by making it into stacks of ensilage, without the necessity of building silos. The plan has been tried for some years in County Kildare with great success. The sodden hay is first of all piled into stacks and well trodden down by labourers, the addition of a layer of brewers' grains, if they can be had, half-way up or near the top of the stack, being very beneficial. The stacks are then covered with a roofing of rough weeds or fern, over which wires are laid with hanging weights on either side of the stack, to retain the necessary pressure, neglect of which precaution might lead to spontaneous combustion. The wet mass will of course heat to some extent, but it will not fire if well pressed. This valuable hint should be remembered by farmers, in case of the recurrence of such a wet season as we have lately experienced.

The Report of Mr Alan Cole on the state of the Honiton lace industry has recently been published as a parliamentary paper. Mr Cole, as Commissioner from the South Kensington Museum, has been visiting Honiton and other towns and villages in Devonshire where this industry has for many years been carried on. He found it in a declining state, the demand having considerably fallen off, which some of the workers attribute partly to unfair pressure exercised by foreign duties on English lace. He found, too, that the children, who used to learn the art as soon as they learned to read, were now no longer taught lace-making. He suggests that the industry is capable of very high development, and advises the delivery of lectures upon the subject, and the offering of various prizes, so as to stimulate the production of first-class designs.

On the coast of Devonshire, not far from Exeter, there is a village called Beer. At this place a tradition has long existed that one of the vessels belonging to the ill-fated Spanish Armada was wrecked in its bay, and that the Spaniards who were fortunate enough to escape from a watery grave settled and throve in the place. This is borne out by the circumstance that the physical characteristics of some of the good people of Beer differ widely from those of their neighbours, for they are swarthy, with black curly hair. There are also in the parish registers of Branscombe hard by—which records go back to the earlier part of the sixteenth century—names of distinctly Spanish origin. In further corroboration of the old tradition, two fishermen at Beer pulled up, entangled in their nets, a very old anchor, fashioned in an antique manner, and quite different from the anchors in use at the present time. These interesting particulars are contributed by the Rev. H. G. Tomkins, lately vicar of Branscombe, to the *Western Antiquary*.

There has lately been exhibited in London a new form of apparatus which has been designed to enable a man to breathe without difficulty in a smoke-laden or poisonous atmosphere. The contrivance consists of a respirator with a series of small filters attached, which contain respectively wet sponge, cotton-wool moistened with glycerine, and animal charcoal. This is fastened to the mouth; while the nose is protected by a clip to prevent inhalation by that organ, and the eyes by an ingeniously formed pair of vapour-proof spectacles. The arrangement enables a man to breathe in dense smoke without inconvenience. But in the case of an actually noxious atmosphere, such as the choke-damp of mines, an additional aid is necessary. This takes the form of a long india-rubber tube, which the explorer drags after him, the end of which remains in a purer atmosphere. It is obvious that such a tube would limit a man's movements considerably, while its accidental rupture would lead to a fatal result. It is probable, therefore, that the apparatus will be far more useful as a protection against smoke, and as such should form a valuable adjunct to the equipment of our fire brigades.

It has more than once been stated as the opinion of authorities upon the subject that the victims of cancer are rarely found among vegetarians, and that the disease is largely due to the carnivorous habits now in vogue. Surgeon-Major Hendley of Jeypore writes to the *British Medical Journal* to give a direct contradiction to this belief, at any rate so far as India is concerned. He states that at the Mayo Hospital in Jeypore during the last eight years there have been performed one hundred and two major operations in cases of cancer at that establishment, which is under his charge. Of these, forty-one were on the persons of meat-eaters, and sixty-one on strict vegetarians, whose religious scruples had forbidden them to touch flesh during the whole course of their lives. Some of the persons so treated belonged to a class so strict that they even eschewed the use of certain vegetables. The maximum age of the sufferers was seventy years, and the minimum eighteen years, the average age being forty-three.

For some occult reason, the domestic cat is extremely fond of the odour of valerian, and if

any person should be so insane as to wish to increase the visits of these nocturnal rambles to his garden, he need only scatter a few drops of the tincture of that root about the place to secure that end. An American journal describes how this fondness of cats for valerian has been put to profitable account. It was found desirable to determine the exact position of some leaks in a house-drain through which sewer gas escaped. An infusion of valerian was poured into the drain, and the cat was set to work. She speedily discovered three places which emitted the attractive odour, and the faults were remedied. A more usual plan, we may remark, is to use essence of peppermint, which can be readily detected without the aid of a cat.

The works of the Manchester Ship Canal continue to go on apace, and parliament is being asked to authorise certain alterations in the original plans which will both increase the efficiency of the water-way and reduce its cost. At a late meeting of the shareholders, the contractor stated that the forty-eight million cubic yards of excavation which had to be executed were being carried out at the rate of a million yards per month, and that he hoped before the end of the summer to double that amount per month.

We recently referred to the successful removal of a large hotel in America by haulage along an improvised railway track, and suggested that the experiment gave fresh interest to Captain Ead's scheme for constructing a Ship Railway across the Isthmus of Tehuantepec, Mexico, and thus connecting the Atlantic and Pacific Oceans by the Gulf of Mexico. We now learn that the contract has been given for the construction of this curious international highway, and that the road is to be completed in five years. Vessels will be lifted and lowered at either end of the track in cradles moved by hydraulic power, and the haulage along the line will be carried out by locomotive steam-engines. Taking into account the financial difficulties connected with the Panama Canal enterprise, it is quite possible that Captain Ead's railway will be ready before the first ship makes its passage through M. de Lesseps' water-way.

Those of our readers who happen to be amateur photographers may be willing to help the Council of the Royal Meteorological Society in their appeal for photographs of lightning-flashes. The same request was made last year; and the pictures collected, while disclosing certain facts about lightning which before were quite unsuspected, do not justify the Committee formed for their consideration in making any generalisations. They require more photographs before this can be done. They point out that such pictures are very easily obtained. The work can only be done at night, and of course during a thunder-storm. The camera, after having been focused for a distant object, is left with lens uncovered and sensitive plate in position at a window, or in any other convenient situation, pointing towards the portion of the sky where lightning is occurring. The flash then registers itself on the plate without any further help from the operator. The sole drawback is that he must be prepared to sacrifice several plates before a serviceable result is obtained.

The suggestion that executions of criminals should be carried out by a more scientific and humane method than that now in vogue has been

before the public for many years; but the subject, important as it is, has not—possibly because of its repulsiveness—received that attention on the part of our legislators which it deserves. The State of New York has taken the lead in actually passing a Bill authorising the execution of criminals by means of the electric current, and this will come into effect on the first day of next year. A Commission was some time ago appointed by the New York legislature to investigate and report upon the subject; and many experiments have been made on the lower animals to test the most humane method by which the dread sentence of the law can be carried out. It now remains to be seen whether the impressive effect of death of such awful suddenness will serve to diminish capital offences, for this, after all, should be the main result to be looked for. The criminal will be seated in a chair, and the mere touch of a button will turn him into a corpse.

For many years the Committee of the Royal National Lifeboat Association have been desirous of discovering some effective means of propulsion for lifeboats, and they have at various times offered prizes for a design which should meet with their approval. Hitherto, these efforts have been without success, for although plans have been submitted to them by many competitors both English and foreign, none of these has been considered to fulfil the conditions required. The Committee have at last accepted the plan of a boat which has been designed by Messrs R. & H. Green of Blackwall, and with some modifications, a vessel constructed on that plan is to be built by the firm in question. It will have a length of fifty feet with a twelve-feet beam, and will be driven by a turbine wheel worked by a powerful engine. It is obvious that such a vessel is not intended to supersede entirely the lifeboats now in use; but for certain ports with harbour accommodation it will be invaluable.

It is now four years since a movement was begun for the establishment at Plymouth of a Marine Biological Laboratory on the pattern of those which are already at work at Naples and at other European stations. The building which was the result of this movement has now been formally opened, with a secured annual income of nine hundred pounds. This building will when complete give accommodation to twenty-four working naturalists, a library for whom is in course of formation. If our country seems somewhat behindhand in making this provision for biological research, the delay has at least been beneficial in enabling its promoters to profit by works of a similar nature which have been established both in Europe and America. The work of the Plymouth Institution will be to investigate the organisation, habits, and surroundings of the multitudes of living creatures which people the British seas; while their structure will be studied with the greatest care in physiological and chemical laboratories, which form part of the scheme. The results will, it is hoped, have most important bearings on the fishing industry, upon which many thousands of pounds have been from time to time expended by successive governments with but barren results. It is through the medium of an establishment such as that just opened at Plymouth that the subject can be attacked *de novo* and from a new standpoint. It will serve to give

that technical education to students from which, in all departments of knowledge, so much good arises. Although the City Companies, with that of the Fishmongers at their head, have contributed munificently to the foundation of this truly national scheme, money is still wanted for its completion and endowment. We cannot suggest to the wealthy any more worthy object for help; while those unable to give more substantial assistance would do well to aid the library with any duplicate copies of standard biological works which they may possess.

An ingenious adaptation of the rocket to life-saving purposes forms the subject of a German patent. The rocket has attached to it a cylinder full of oil, together with an explosive charge, which scatters the liquid over a wide area when the projectile reaches the end of its journey. From several experiments which have been conducted at sea with this new appliance, it is found that the rocket will travel nine hundred feet in the teeth of a gale. By firing several rockets in different directions from a storm-tossed ship, a large area of smooth water is secured to her. The use of oil at sea will certainly be rendered more efficient by the employment of such a means of throwing the liquid in the exact direction required.

Admiral Sir W. H. Grubbe has been conducting some experiments at the Cape of Good Hope on a new mode of signalling by means of the electric arc lamp, which is now carried by so many ships. The ray from such a lamp is cast upon the clouds, and is interrupted so as to form long or short flashes for the requirements of the Morse alphabet. Such signals can be seen and deciphered at a distance of fifty miles or more. The plan would seem to be especially useful at sea, and also on flat coasts, where the convexity of the earth would prevent the direct light of the lamp being observed. But it is not clear that it would be available except when clouds are present in the sky.

Mr Edison's Phonograph, at the time of its introduction a few years back, led to wonderful anticipations as to what it could bring about. We were then told that the voices of our public singers and orators could be reproduced by it at the will of the operator, and that the dying testator need no longer leave a document subject to dispute, for the phonograph would register his wishes in actual speech, which could be reheard, if necessary, years after he had turned into dust. These sanguine hopes were destined to disappointment. The instrument, marvellous as it was as a triumph of acoustical science, and valuable as it proved to be in demonstrating certain laws, was, beyond these uses, a mere curious toy. But its diligent inventor did not mean that it should ever remain so. Although his attention has been occupied of late years in other directions, and notably in perfecting various aids to electric lighting, he has not forgotten the phonograph. He has now produced it in a much improved form, and there is every reason to suppose that the instrument will be serviceable in many ways. Among its possible uses it will serve as a model to orators, for it will repeat exactly, and as often as required, the speech conveyed to it by an accomplished speaker. It is evident, too, that it would in like manner be wonderfully useful in instructing a student of lan-

guages in the art of correct pronunciation. When we add that this preserved speech can be sent through the ordinary post, it will be evident that the phonograph has before it a wide field of usefulness.

It seems to be determined that America is to take the lead in astronomy, so far as the construction of enormous telescopes is concerned. The vast instrument at the Lick Observatory, which has but recently been made over to the University of California, has already a rival in the shape of a telescope of twenty-inch aperture, which is to be constructed at Denver, by the munificence of Mr H. B. Chamberlain of that city. Although this telescope is not so large as the one at Mount Hamilton, already alluded to, it will have the advantage of standing on a site five thousand feet above the sea-level, or eight hundred feet higher than the Lick telescope. It remains to be seen whether these vast instruments will do as much as their sanguine projectors anticipate. The greatest astronomical discoveries were made with apparatus so faulty in construction that it would in these days have no intrinsic value whatever. With such an instrument, Galileo saw that Venus had phases like the moon, and so corroborated the truth of the Copernican theory of the universe.

An ingenious form of meter was brought before a recent meeting of the Gas Institute by its inventor, Mr Brownhill. It is known as the 'Pre-payment Gas-meter,' for it works on the principle of the automatic drop-coin machines which are now so common. A penny dropped into it, and a pennyworth of gas will be given out. The contrivance really consists of a box attachment which can be adjusted to any form of meter new or old. It is calculated that it will prove of great service in small households, where quarterly payments represent financial difficulties of no mean kind, and where the possibility of purchasing small quantities of petroleum tempts families to adopt a far more dangerous form of illumination. For sub-tenancies in large premises the plan will prove very useful, as it will also in the case of buildings which are let by the evening for entertainments. On the other hand, the householder will have to guard his gas-meter as jealously as he does his spoons. He will no longer be able to relegate it to a corner in his kitchen or scullery, but must place it in a more protected situation under his own control.

MY INHERITANCE.

'If Mr Frank Heathcote will call on Messrs Pounce, Parchment, & Co., Old Square, Lincoln's Inn, he will hear of something to his advantage.' This brief note in a legal hand astonished me, the above-named Frank Heathcote, one morning on sitting down to a modest breakfast. To hear of *anything* to my advantage was surprising and delightful, as I was unfortunately one of the unemployed, with little expectation of something turning up.

An hour or two later saw me searching in Lincoln's Inn for the offices of Pounce & Co. On finding the house, I duly presented myself. Mr Pounce had not arrived; but would I step in and see Mr Parchment? The lawyer did not belie his name, for I have seldom seen so

dry and yellow looking a man. On presenting my note, Mr Parchment surveyed me in silence for a few minutes.

'So you are the nephew of the late Mr Horace Oldcastle, young gentleman, I presume?'

I replied I had that honour.

'Allow me to congratulate you on your good fortune,' said the lawyer with a lurking smile.

Opening a desk, he produced the copy of a will, by which my lamented uncle left me Hernmere Place, an old Hall in Sussex, on condition that I should occupy it.

'Pray, sir,' said I, 'can you give me any information respecting this property?' for, truth to tell, my uncle had never invited me to see him, and I had only an indistinct recollection of the old gentleman.

'The Hall,' replied the lawyer, 'is an interesting place from an artist's point of view; but the situation is just a trifle secluded; and the building is, I am afraid, a little out of repair; but a small outlay would render it habitable, and doubtless you will soon get over the loneliness.'

Being furnished with the necessary credentials, and agreeable to the terms of the will, I set out for Sussex. Upon inquiry, I found that Hernmere Place was some five or six miles from the nearest railway station; so, having my effects packed in a knapsack, I thought I might as well walk that distance. The way lay along a beautiful bend of the South Downs. The season was spring, and the cool breeze that came sweeping over the hills was most exhilarating and laden with perfume. After climbing a long gradual ascent that wound round a spur of the Downs, I reached the summit. The view that opened out was wild and splendid. Long slopes of flower-spangled turf alternated with dense patches of furze; while on every side the ground rose and fell in wave-like swells. Near at hand, a shepherd was watching a large flock of sheep, the tinkling of whose bells sounded quite musical. In the far distance the sea sparkled under the keen bright sky. Overhead, light fleecy clouds floated peacefully, while two larks made melody.

On asking the shepherd the way to Hernmere Place, he directed me in the quaint dialect of the district. Keeping his directions in view, I soon came to the rusty gates of Hernmere Place. The house was of brick, in the Tudor style, and, from the signs of decay, evidently of great age. A moss-covered buttressed wall extended on both sides of the gate and shut in the front of the house completely.

Entering, I came to what had once been the lawn, but was now a wilderness of weeds. The path leading to the Hall door was damp and grass-grown; and the aspect of the whole place was picturesque, but melancholy. There was no sign of life or welcome in the old house, many of the window shutters being closed. The walls were blotched and lichen-covered, and in some places long straggling branches of ivy hung in neglected festoons. Going round the house, I came to a tangled and overgrown garden, at the farther side of which, through an open wicket, I could make out an old man busy with a small patch of vegetables. On presenting myself to this venerable person, who was the custodian, Griggs by name, I was welcomed in a somewhat peculiar manner. My new acquaintance first rummaged in the pocket

of his coat, which lay on a wheelbarrow, and produced an antique pair of spectacles, which he presently adjusted. Looking me very attentively in the face for some time, he at length said: 'You be main loike old Muster Oldcastle. I moind him well when he was as young as you.—But walk in, sir, and my missus will get you a bit of summat to eat.' Putting on his coat, the old fellow hobbled up the steps leading to the garden-door of the house.

Inside, the signs of age were if anything more apparent. The old wainscoted passage was hung with cobwebs, and our footsteps echoed loudly along the stone floor. Passing up a twisted staircase, we entered a small room on the first floor.

'This was the room in which your uncle spent most of his time, and it was here he died,' said Griggs.

I gazed around, and felt a sense of dread creep over me. The walls were panelled with dark oak; along one side was an old cabinet, black with age, and on a shelf above it was arranged a small collection of ancient-looking books. Close to the window was a writing-table, on which stood an old desk. A few high-backed chairs were placed by the walls, and some ancestral portraits looked down with eyes that seemed to follow my every movement. By the fireplace stood a capacious armchair, shut in with an old screen covered with stamped leather.

The view from the window was very striking. Beyond the garden lay a large pool of water, surrounded by drooping trees and bushes, and fringed with a tangled growth of rank weeds. The afternoon had become suddenly overcast, and dense masses of cloud were rolling up; while a cold wind ruffled the surface of the water and tossed about the trees growing around. Beyond the pool was a flat marshy valley, on the opposite side of which a range of hills shut in the view.

Meanwhile Mrs Griggs, an ancient dame of gnarled and knotted aspect, was endeavouring to make a fire blaze in the rusty grate. Accomplishing this, in course of time a plain meal was set before me, and I was left in peace to discuss it. The walk having given me a fine appetite, I fell to, nothing loth. When I had finished, I made a closer inspection of the contents of the room. A cupboard in the wall was filled with old lumber of various descriptions. Opening the cabinet with one of the keys given to me by the lawyer, I found drawers filled with old accounts done up in a methodical manner, a pair of silver-mounted pistols of a bygone date, some odds and ends of curiosities, but nothing of any special interest or value. At length I opened a small drawer with the smallest key of the bunch, and took out a sealed packet, which was addressed to me. Unfastening it eagerly, I found it to contain a miniature of a lady and child, and also a short letter, which ran as follows:

NEPHEW FRANK—I leave you the old house, which has been in our family since it was built. Though it is desolate enough now, it once echoed the voices of those very dear to me. See that you do not suffer anything to be destroyed. I parted in anger with your mother, my only sister; but now would prove if you, the only remaining

descendant of the old house, are worthy to bring back its former state. Patience and perseverance are necessary; but if you strive, you will in the end be rewarded. My blessing rest on you, if you obey.

HORACE OLDCASTLE.

After reading the letter several times, I rang for old Griggs, to try to get some information about my uncle.

'He were a close man, were Muster Oldcastle,' said he, 'living here by himself since his wife and child died years ago. He left the old place exactly as it was when they were alive, and could not bear to see strangers. My idea is that the trouble made him a bit queer. He caused the west wing to be shut up; and they do say as some of the old Oldcastles walks there. I never see any of 'em; but there's strange noises o' noights.'

I made an inspection of the house, and pitched upon a bedroom next to my uncle's study as being most convenient. Mrs Griggs lit a fire there, and bringing in some bedclothes, made the room in a little while as comfortable as circumstances would permit. The wind had now increased to a gale, and heavy drops of rain dashed against the window. Returning to my uncle's study, I settled myself before the fire to enjoy a snug evening before turning in for the night. The old couple, who occupied some rooms in a distant part of the house, having retired, I felt myself cut off from the world. A pair of candles flickered on the table, and the changeful light of the fire lit up and threw into gloom the dark walls and furniture. Taking a book, I was soon deep in its pages. It was an old collection of legends and romances of Spain. One tale took my fancy. It related how a certain Don Alfonso made a search in the Alhambra in Granada, and how, after many strange adventures, at length was successful in breaking the charm that held a great treasure guarded by enchanted Moors, and became possessed of the whole. I became deeply interested in the old-world legends. After a while I closed the book, and leaning back in my chair, fell into a brown-study. Suddenly I became aware of a strange thing. An old man, whom I knew to be my uncle, though I had only seen him once, years ago, was standing by the cabinet, looking intently at the books on the shelf. I stared at him with all my eyes, and yet, though full of amazement, I felt no fear. After a short time he took down a book, opened it, and seemed to make a mark inside. He then replaced it, and took down the next, and, by slow degrees, went through most of the library. Suddenly, I heard a loud knock at the door, and breaking the spell that held me, I started up and confronted Mrs Griggs. Turning to the cabinet, I saw no one there; the books were on the shelf, and I noticed the empty space from which I had taken the Spanish legends. For a time I could do nothing but stare at Mrs Griggs, who kept courtesying and asking me if I would take any supper. Asking her if any one was in the house except her husband, she said no, and that the door had been locked for more than an hour.

Dismissing the old woman with a good-night, I seated myself by the fire, and on thinking quietly over the strange event, came to the conclusion that I must have fallen asleep and dreamt it.

A sudden thought struck me that perhaps I might find something in the books about which my uncle had seemed so busy. Looking at the backs, I saw that each book was marked with a letter stamped in gold under the title. Beginning at the left-hand volume, which was marked A, each was marked in alphabetical order, ending with the last volume Z. Looking over the pages of the first volume, I could find nothing written in it, the only mark being a red cross on one of the leaves. Reading this particular part threw no light on the mystery, as the text related to legal matters about the possession of land. Having no more relish for reading that night, I retired to my bed in the next room, and soon forgot my uncle in a sound sleep.

In the morning I rose early, greatly refreshed, and strolled out to view my domain. The sun shone brightly, and it was impossible to feel gloomy under the clear fresh sky, with the sweet breeze playing over the peaceful hills. Returning, after a short walk, to breakfast, I then set myself to consider my position and arrange matters as to my new mode of life. I had been left, some few years back, with an allowance which barely sufficed to keep me, but had unfortunately been put to no profession. The outlook was not promising, and I did not feel very hopeful regarding my future. To try and cheer myself up, I made a tour over the old house. The rooms were mostly in a state of decay; but the furniture and decorations, in spite of the ravages of time, were handsome, and showed that my ancestors kept great state at one time. My uncle was reputed to have been very rich, but what he did with his money was a mystery, for he had only left some paltry legacies. The west wing of the house had been shut up for years, in consequence of some dreadful occurrence which had happened there. I did not care to investigate the gloomy chambers.

As time went on, I became more resigned to my new home, but still found it very dull; and my occupations being so limited, the days dragged slowly by. I made a few acquaintances, but found no congenial companion to fill up my empty hours. Spring blossomed into summer, and summer, with all its beauty, mellowed into autumn, when an event occurred which turned the current of my life.

One morning in September I received a letter from Tom Saxon, an old chum and schoolfellow, saying he would like to spend a few weeks with me in Sussex, if agreeable. I was delighted for two reasons: because Tom was a good fellow; and because Tom's pretty sister Clara and I were waiting till my prospects would entitle me to hope for a favourable reception at the hands of Mr Saxon senior. I was in a fever of impatience to meet Tom. I went to the station long before the train was due, and when it did come in, I could have rushed into his arms. After dinner our time was taken up with questions and answers on both sides.

'By-the-bye, Frank,' said Tom suddenly, 'you mentioned something strange about your first night here—connected with your uncle. Tell me all about it.'

He listened attentively whilst I related my dream. When I had finished, he rose, and going to the cabinet, took one of the books from the

shelf. He looked over it carefully, and then inspected more of the volumes. When he had spent some time in this way, he came back to the fire with a disappointed look.

'Can't make anything out of the books,' said he, standing with his back to the blaze and with his hands thrust deep in his pockets, 'except that the old boy had a peculiar fancy to letter the backs of the volumes with the alphabet instead of numbering them. Some of the pages are marked with a red cross, but the matters on them don't appear to throw any light on the subject.'

After giving vent to his feelings in several vigorous pulls at his pipe, Tom fixed his eyes thoughtfully on the old desk on the table. 'This seems a curious desk. Perhaps you may have overlooked some clue to the mystery contained in it. Would you mind me looking into it?'

I opened the desk, but we could find nothing of consequence in it.

'You haven't looked in the secret drawer,' said Tom. 'All desks have one. Let me try my hand.' Suiting the action to the word, he gave the bottom of the desk such a blow that a small compartment which had escaped my notice flew open, and something fell with a ringing sound on the floor. Tom uttered a satisfied sound, and picked up a key of curious and antique workmanship. 'This will most likely unlock the mystery, since your uncle seems to have put it away so carefully.'

We started on a voyage of discovery over the old house. Many of the cupboards and boxes were unlocked; and those which were fastened could be opened by some of the keys with which the lawyer had furnished me. After a long hunt, we gave the thing up as a bad job. Tired out, we retired to rest, and forgot our disappointment in sleep.

Next morning, after breakfast, Tom commenced a sketch of the front of the mansion, at which he worked hard till dinner-time. In the afternoon we went for a walk. Thus a week went by, varied only by a little fishing in the pool. The picture was finished, and another begun. One afternoon, Tom said he should like to have another shy at the mysterious library. 'I have been thinking it over all the week, and I fancy I have made a discovery. You will notice, on looking through the books carefully, only one page in each is marked, and that all the marks occur in the first score or so of leaves in each volume. Now, what set me thinking was the whim of your uncle having the alphabet marked on the backs of the books. This one marked A is crossed under the number of page 19; the next book, B, under number 5; C, under number 1; D, under number 18; E, under number 3; and F under number 8. Now, taking the numbers of the pages to represent corresponding letters of the alphabet, we get the word SEARCH. I haven't got any further yet, but we must work it out together.'

I jumped up and seized Tom's hand. 'You have hit it now for certain, my dear fellow.'

'Don't be premature. It may only turn out a mare's-nest after all. However, here goes to get at the root of the matter.'

Working eagerly yet carefully through all the volumes, we got the following results. Numbers

of pages marked with a red cross, and the corresponding letters:

19, 5, 1, 18, 3, 8, 3, 1, 18, 5, 6, 21, 12, 12, 25,
S E A R C H C A R E F U L L Y

20, 8, 5, 7, 15, 12, 4, 18, 15, 15, 13.
T H E G O L D R O O M.

'Well,' said Tom, when we had made out the above, 'this certainly looks like a find. Let us set about examining this same Gold Room at once.'

There was a chamber on the second floor of the house having the walls covered with leather, on which a great number of elaborate designs were stamped in gold; hence its name. We hurried to this room and set to work to try and discover the secret. There was scarcely any furniture; what there was, we carefully examined, but to no purpose.

'Never say die,' said Tom. 'We must now try the walls.' He commenced tapping and feeling in all the odd corners; went into a cupboard, tried the window-seats; and, as a last resource, turned his attention to the chimney-piece, which was very large and highly carved. The mantel was high, and projected a good way over the hearth. The panels on either side were ornamented with grotesque figures cut in bold relief. Tom looked up the chimney, rapped the wood-work, and pried into each little nook. I was similarly engaged, but with no success. An exclamation from Tom caused me to rush to his side, when I saw him pushing at a small grotesque head enclosed in a wreath of leaves and flowers. 'This seems to give a little, Frank,' said he; and exerting his whole strength, the projection sank into the panel, which slid a little to one side and disclosed a dark opening.

'Stop here a moment, Tom,' said I, highly excited, 'while I get a light. We must be on the eve of a great discovery.' Hurrying down-stairs, I got old Griggs to light a lantern; and snatching up a chisel and a hammer, made my way back as fast as I could.

We forced the panel far enough to allow us to enter, and groped our way along a dark, musty-smelling passage, only feebly illuminated by the lantern. Stumbling along in what seemed nearly one direction, we came to a steep flight of stairs, evidently built in the thickness of the wall, and ending in a small door, at which we stopped. Feeling no latch, we gave a simultaneous heave, and bursting the obstacle, fell forward into a room. Recovering ourselves, we searched about on the floor for the lantern, which we discovered in a crushed condition, and the light extinguished.

'Here's a pretty go!' cried Tom. 'It's so dark we can't find anything. One of us had better go back and fetch a light.' I volunteered to stay. Tom felt his way slowly down the stairs, and after what seemed an age, returned with a candle and a box of matches.

'I wouldn't trouble Griggs,' said he. 'I got these from my bedroom, as we had better manage this business quietly by ourselves.'

We gazed about in a bewildered way on the room we had discovered. It seemed to be close under the roof, and, from the direction of the

passage, was evidently in the west wing of the house. The walls and floor were covered with dust; and the little air the place contained came through a small grating over the top of the door. In one corner, fastened to the floor by strong iron clamps, was a ponderous-looking oak chest, girt with bands of iron, studded with nails, and fastened with a curiously ornamented lock.

'I have it!' said Tom. 'That curious key we found in the desk will very likely fit this lock; the ornamentation seems very similar in design.'

In a few minutes I returned with the key, and after a vigorous wrench, managed to unlock the chest. We pushed open the heavy lid; and a perfect mine of wealth was disclosed to us. My uncle must have had an old-fashioned prejudice against banks, for here was evidently the hoarded riches of years, stowed away in a secret chamber, and further protected by being in the part of the house supposed to be haunted. In the chest we also found a letter, addressed to me:

DEAR NEPHEW—If you find this money, as I believe you will, take it as the reward for obeying my wishes. As the Hall has been in our family since its foundation, I solemnly charge you to adopt the name of Oldcastle; and may the old line be revived in you.—Your loving uncle,
HORACE OLDCASTLE.

This letter was dated only a few weeks before my uncle's death; and it seemed strange and sad to be hearing, as it were, the words of a dead man in that dark and ghostly chamber.

With the help of Tom I was soon placed on a friendly footing with his father, and the dreariness of the past was forgotten in the light that beamed from Clara's dear eyes.

We had a regular cleaning and polishing up of Hernmere Place; the west wing was thrown open to the light of day; and a few months after saw Clara enthroned as mistress of the old Hall.

My uncle has never again visited me in my dreams, and this I take to be a proof of his satisfaction with the way in which I have carried out his wishes.

SECURITE.

'Securite' is the name given to an explosive recently discovered by Herr Schoeneweg, an eminent German chemist, which has been more particularly introduced for use in mines liable to firedamp, the speciality of the new product being that no flame is generated when the charge is exploded. In appearance, securite is a granulated powder, possessing a light yellow colour, and has an odour resembling that of bitter almonds. It cannot be ignited by friction, blow, or jar; hence all risk in transport or storage is entirely obviated. Explosion can only be produced by strong caps of one gramme of fulminate of mercury, and then no flame being given off, accidents arising from the presence of firedamp or coal-dust are rendered impossible.

To put this fact beyond question, a series of severe tests has been carried out with securite. It has been fired in specially prepared tubes, and in contact with firedamp and coal-dust, under circumstances which would, in the ordinary course of everyday working, have been in the highest

degree dangerous. In these experiments the compound has acquitted itself to the satisfaction of the experimenters, and in no case has explosion of the firedamp or coal-dust ensued. To carry the test still further, the gallery of a pit was rendered very foul by temporarily stopping the ventilating current; and after the atmosphere had become highly charged with firedamp, several shots of securite were fired: no flame resulted; and consequently, accidents, which must have resulted with any other explosive, were entirely averted. The gases arising from the explosion of securite are small in volume, and harmless to the health of persons inhaling them.

With respect to cost, it is stated that securite can be placed on the market at a cheaper rate than dynamite, whilst in point of strength it is but little inferior to that explosive. Securite is readily manufactured, the process occupying, according to its inventor, but one hour; whilst no deterioration results on storage, a desideratum of by no means minor import. The manufacture is vigorously carried on in Germany, and steps are being taken to establish similar works in this country.

When it is pointed out that the estimated amount of coal raised annually in Great Britain is one hundred and seventy million tons, giving employment to some half-million miners, enough has been said to indicate how vast a field in this branch of our industries alone lies open to the manufacturers of a safe explosive.

IN VAIN.

WE meet, although we know 'tis vain;
Each meeting leaves a burning pain—
But still we pray to meet again,
And vainly long the more.
Yet when it comes, our words are none:
Hearts as on fire, lips turned to stone;
Each meeting leaves us—when alone—
More hopeless than before.

Why do we not for ever part,
Nor let each wretched struggling heart
Though sore with unavailing smart,
Still linger o'er the flame?
Ah me! the love that grows with years,
The love that bears, not hopes, but fears,
The ceaseless fount of bitter tears,
Still lives, till death, the same.

THE FORTH BRIDGE.

BY BENJAMIN BAKER, C.E.

TWENTY-THREE years ago Parliamentary powers were obtained by the North British Railway Company to construct a bridge across the Firth of Tay, and a bridge across the Firth of Forth, for the purpose of 'securing for the North British, Great Northern, North-Eastern, and Midland Railways, a fair share of the through-traffic between England and the north of Scotland, hitherto practically monopolised by the London and North-Western and Caledonian Railways.' As all the world knows, the original Tay Bridge was constructed and opened for traffic in May 1878; blown down with the loss of seventy-five lives in December 1879; re-constructed, and again opened for traffic in June of last year. The Forth Bridge authorised by the twenty-three-year-old Act of Parliament was to have crossed the Forth at a point five miles above Queensferry where the water was shallow; but the mud proving to be of practically unlimited depth, the project was of necessity abandoned, and another point of crossing selected. This was found at Queensferry, where the island of Inchgarvie stands as a stepping-stone in the middle of the channel, leaving, however, a depth of over 200 feet of water on either side—too deep for intermediate piers—and consequently a bridge having two openings of the unprecedented span of 1700 feet became a necessity, and Parliamentary powers were obtained for its construction fifteen years ago.

Owing to the fall of the Tay Bridge, the original design for the Forth Bridge on the suspension principle was abandoned, and the far more rigid cantilever girder design of Messrs Fowler and Baker was substituted. Operations were commenced in the spring of 1883 by the establishment of large bridge-building works at Queensferry, with special appliances and machines of a novel character adapted to the bending, planing, drilling, and riveting of the 50,000 tons of steel plates and bars required for the superstructure of the great

Bridge. The work since then has been continuously pressed on by day and by night, and the termination of the arduous labours of the engineers and contractors is now within measurable distance, for it is anticipated that the autumn of next year will see the completion of the Bridge.

Since the designs of the Forth Bridge were published, many cantilever bridges have been built in America and elsewhere, and the term cantilever has thus become familiar to the public. Such was not the case originally, and one of the first questions asked by visitors to the Forth Bridge was, 'What is a cantilever bridge?' The word 'cantilever' is, as will be shown in Dr Murray's new English Dictionary, several hundred years old. It means simply a bracket or projecting arm; and a cantilever bridge consists of two such brackets, and a central beam connecting the two ends. When lecturing recently at the Royal Institution, I exhibited what might be termed a living model of the Forth Bridge, arranged as follows: Two men sitting on chairs extended their arms and supported the same by grasping sticks butting against the chairs. This represented the two double cantilevers. The central beam was represented by a short stick slung from the near hands of the two men, and the anchorages of the cantilevers by ropes extending from the other hands of the men to a couple of piles of bricks. When stresses were brought to bear on this system by a load on the central beam, the men's arms and the anchorage ropes came into tension, and the sticks and the chair-legs into compression. In the Forth Bridge it is to be imagined that the chairs are placed a third of a mile apart; that the men's heads are 340 feet above the ground; that the pull on each arm is about 4000 tons, the thrust on each stick over 6000 tons, and the weight on the legs of the chair about 25,000 tons.

The advantages of the cantilever system of construction as regards simplicity and rigidity were appreciated by the Chinese hundreds of years ago, and many timber structures on that

principle are still to be found. No important metallic structure of the kind was, however, in existence previous to the publishing of the designs of the Forth Bridge. The advantages of the system under the conditions found at the Queensferry crossing are enormous. Thus, as the superstructure can be erected without scaffolding, it is immaterial whether the water be two feet or two hundred feet deep. Again, as the cantilevers are built by commencing with the work over the piers, and adding successive portions of steel-work on each side until the cantilevers project the required distance, there is perfect solidity at all stages of the erection, and there are none of those periods of risk and anxiety which occur when girders are built on temporary staging, or are floated into position on pontoons, or otherwise erected. All of the anticipated advantages of the system have been fully realised in the case of the Forth Bridge, for at the present moment the cantilevers project about half their full length over the sea; upwards of 28,000 tons of steel-work have been erected, and not a single plate or bar has been lost or injured in any way during the wildest gales.

At no period of the operations has the Forth Bridge presented greater features of novelty and interest to its thousands of visitors than at present; nevertheless, there were times in the past when works now hidden and forgotten called for all the vigilance and skill of the engineers and contractors. Such were the pier-works at Inchgarvie and South Queensferry. Each of these piers consists of four columns of concrete and masonry, about seventy feet in diameter, founded on rock or boulder clay at depths up to ninety feet below high-water. The usual way in this country of building such piers is to enclose the site within cofferdams and pump out the water. In such a stormy estuary as the Forth this could not be done, so the piers were founded on enormous diving-bells, seventy feet in diameter, the masonry being built on the top of the bells, and the men working within the same, excavating the earth and passing it through air-locks into the open air, and so, by a process of undercutting, sinking the pier like a huge pile through the soft soil to a solid substratum. Powerful air-pumps kept the diving-bells charged with compressed air, by which means the water was excluded, and the men worked in a brilliantly lighted chamber seventy feet in diameter, at a depth of ninety feet below sea-level, as readily as on dry land. Of course it is not given to every one to work with comfort in a place where the barometer stands as high as one hundred and twenty inches, which it did in the Inchgarvie diving-bell caissons. One of the first sensations in passing from the ordinary atmospheric pressure into compressed air is a painful pressure on the drums of the ears, which is relieved by swallowing. A long continuance in a high pressure leads to paralysis of the nerves, the workmen walk with difficult step and a slight

stoop, violent cramps and death often supervene. When Glaisher and Coxwell made their high balloon ascent in 1862, the barometer fell to seven and a half inches, and temporary paralysis of the nerves then occurred; but the matter for surprise is rather that the human organism should sustain at all such wide ranges of atmospheric pressure as from seven and a half inches to one hundred and twenty inches of mercury, than that some amount of personal inconvenience or danger should result from it.

When the masonry piers had been securely founded in the manner described on the rock, or hardly less firm boulder clay forming the bed of the Forth, the erection of the steel superstructure was commenced. Over the piers are lofty steel towers made of four columns 12 feet in diameter and 340 feet high, bound together in all directions to resist wind-storms and the forces resulting from the passage of the heaviest and fastest trains on the East Coast route. An ascent to the top of these towers, at the height of the golden cross on the dome of St Paul's Cathedral, is an event not soon forgotten. Hundreds of visitors, men of science of all nations, turbaned Indian princes, and even venturesome young ladies have done it, and all alike have been impressed by the sublimity of the scene. Standing on the edge of the top platform and glancing down at the workmen hanging in mid-air by fine wire ropes, at the steam-barges manœuvring below laden with portions of the structure, the vessels of all classes at anchor or sailing, and the whole grand panorama of the Firth of Forth, the scene recalls vividly that passage in *King Lear* where Edgar leads Gloucester to the edge of the cliff:

Stand still.—How fearful

And dizzy 'tis to cast one's eyes so low!

The crows and choughs that wing the midway air

Show scarce so gross as beetles.

Experience has shown that in a very short time workmen lose all sense of the height at which they are working, and that they can not only glance down, but climb down without any feeling of dizziness.

The steel towers being built, the next step was to commence the erection of the great cantilevers. These each project 680 feet from the towers over the sea, and consist of a curved bottom member, shaped like a fishing-rod, tapering from twelve feet diameter at the butt to five feet diameter at the end, connected by diagonal bracing to an inclined top member of lattice construction. This massive steel-work is erected without scaffolding by powerful steam cranes and winches carried by the Bridge itself.

Everything in connection with the Forth Bridge except the rolling of the steel plates has been done on the spot, and this has necessitated the establishment at the little burgh of Queensferry of one of the largest bridge-building works in the kingdom, capable of turning out 1500 tons of finished girder-work every month. More than half a million sterling has been expended in machinery, buildings, railways, steamboats, and

other plant. The number of men employed on the works has at times been as high as 4300. Much of the work at the Forth Bridge requires men possessed of great coolness, courage, and hardi-ness. Nervousness would simply induce an acci-ent, and consequently when crawling along narrow planks or angle bars with a clear drop of three or four hundred feet below them, the men have to dismiss from their minds all ideas of what students of dynamics call the motion of a falling body under the unbalanced action of its own weight. Unfortunately, men have fallen from all heights on to the lower staging, and into the sea; but having reference to the novelty and difficulty of the work, the number of accidents has been singularly small. The works have been carried on under the personal direction of Sir John Fowler, K.C.M.G., and Mr Benjamin Baker, the engineers, and Mr William Arrol, the chief contractor, aided by a large staff of clever and zealous assistants.

It must be admitted on all hands that the great Forth Bridge will be the crowning work of the railway system in this country, and that nothing of the kind of equal importance can reasonably be expected to follow it. It will also be admitted that it would be difficult to exaggerate the benefits which railways have conferred upon this country. At the beginning of the century, when Mr Pitt wanted a few millions, the terms he offered were one hundred and fifty-seven pounds of three per cents. for one hundred sovereigns. We have lately seen Mr Goschen's successful conversion of the National Debt into a two and three-quarter per cent. stock, and there is little doubt that the altered conditions are largely due to the changes wrought by the development of the railway system. When, therefore, it is asked whether the end will justify the means, and whether the saving in time and distance will pay for the heavy expenditure on the Forth Bridge, the obvious answer is that time is becoming more and more a priceless commodity, and that the quickest route, irrespective of almost all other considerations, will carry the traffic and earn the money. The opening of the Forth Bridge will in all probability lead to a noteworthy acceleration of the already fast running of the northern expresses. That such is practicable is proved by actual experience both in this country and America. A speed of 75 miles is often attained on the Great Northern Railway, and it was also attained two years ago on the New York Central Railway, when an average speed of 65½ miles an hour was maintained for the whole distance of 149 miles between Syracuse and Rochester. Sooner or later, as railway managers have found out to their cost, whatever can be done to improve the train service has to be done, and as the construction of the Forth Bridge has demonstrated the practicability of building railway bridges of great span, New Yorkers have ceased to be content with ferry-boats, and demand the substitution of a bridge across the Hudson. Two such projects are before the public—one a bridge having two spans of 1600 feet each, and another with a single span of 2800 feet. No further evidence is required of the great influence which the Forth Bridge will exercise on the railways of the future; for it is already clearly shown that the Forth Bridge, great work though it be, is but

the pioneer of still greater works in countries whose physical features and commercial require-ments demand the building of railway bridges of great span.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAP. XLIII.—AT MONTE CARLO.

HUGH had not had the carriage entirely to himself all the way; a stranger got in with him at Mentone station. But so absorbed was Hugh in his own thoughts that he hardly noticed the new-comer's presence. Full of Elsie and drunk with joy, he had utterly forgotten the man's very existence more than once. Crying and laughing by turns as he went, he must have impressed the stranger almost like a madman. He had smiled and frowned and chuckled to himself, exactly as if he had been quite alone; and though he saw occasionally, with a careless glee, that the stranger leaned back nervously in his seat and seemed to shrink away from him, as if in bodily fear, he scarcely troubled his head at all about so insignificant and unimportant a person. His soul was all engrossed with Elsie. What was a casual foreigner to him, with Elsie, Elsie, Elsie, recovered?

The Casino gardens were already filled with loungers and children—gamblers' children, in gay Parisian dresses—but the gaming-rooms themselves were not yet open. Hugh, who had come there half by accident, for want of somewhere better to go to, and who meant to return to San Remo by the first train, strolled casually without any thought to a seat on the terrace. Preoccupied as he was, the loveliness of the place nevertheless took him fairly by surprise. His poet's soul lay open to its beauty. He had never visited Monte Carlo before; and even now he had merely mentioned the name at random as the first that occurred to him when he went to take his ticket at the San Remo booking-office. He had stumbled upon it wholly by chance. But he was glad he had come; it was all so lovely. The smiling aspect of the spot took his breath away with wonder. And the peaceful air of all that blue bay soothed somewhat his feverish excitement at the momentous discovery that Elsie, his Elsie, was still living.

He gazed around him with serene delight. This was indeed a day of joyful surprises. The whole place looked more like a scene in fairyland in full pantomime time than like a prosaic bit of this workaday world of ours. Lovely by nature, that exquisite spot—the fairest, perhaps, in all Europe—has been made still lovelier by all the resources of human art. From the water's edge, terraces of luscious tropical vegetation rise one after another in successive steps towards the grand façade of the gleaming Casino, divided from one another by parapets of marble balustrades, and connected together from place to place by broad flights of Florentine staircases. Fantastic clusters of palms and aloes, their base girt round with rare exotic flowers, thrust themselves cunningly into the foreground of every beautiful view, so that the visitor looks out upon the bay and the mountains through artistic vistas deftly arranged in the very spot where a Tuscan

painter's exuberant fancy would have wished to set them for scenic effect. To Warren Relf, to be sure, Monte Carlo seemed always too meretriciously obtrusive to deserve his pencil; but to Hugh Massinger's more gorgeous oriental taste it revealed itself at once in brilliant colours as a dream of beauty and a glimpse of Paradise.

He looked away next to the nearer foreground. The dreamland of Monte Carlo floated in morning lights before his enchanted eyes. The great and splendid turreted Casino, the exquisite green lawns and gardens, the brilliant rows of shops and cafés, the picturesque villas dotted up and down the smooth and English-looking sward, the Italian terraces with their marble steps, the glorious luxuriance of waving palm-trees, massive agaves, thick clustering yucca blossoms, and heavy breadths of tropical foliage—all alike fired and delighted his poetical nature. The bright blue of Mediterranean seas, the dazzling white of Mediterranean sunshine, the brilliant russet of Mediterranean roofs, soothed and charmed his too exalted mood. He needed repose, beauty, and nature. He looked at his watch and consulted the little local time-table he had bought at San Remo.—After all, why return to that lonely *pension* and to dead Winifred so very soon? It was better to be here—here, where all was bright and gay and lively. He might sit in the gardens all day long and return by the last train to-night to Winifred. No need to report himself now any longer. He was free, free: he would stop at Monte Carlo.

Why leave, indeed, that glorious spot, the loveliest and deadliest siren of our civilisation? He felt his spirit easier here, with those great gray crags frowning down upon him from above, and those exquisite bays smiling up at him from below. Nature and art had here combined to woo and charm him. It seemed like a poet's midsummer dream, crystallised into lasting and solid reality by some gracious wave of Titania's wand.

He murmured to himself those lines from the *Daisy*:

Nor knew we well what pleased us most;
Not the clipt palm of which they boast;
But distant colour, happy hamlet,
A mould'ring citadel on the coast:

Or tower, or high hill-convent, seen
A light amid its olives green;
Or olive-hoary cape in ocean;
Or rosy blossom in hot ravine.

Exquisite lines! He looked across to Cap Martin and understood them all. Then his own verses on his first Italian tour came back with a burst of similarity to his memory. In his exultation and unnatural excitement he had the audacity to compare them with Tennyson's own. Why might not he, too, build at last that mansion he had talked about long, long ago, on the summit of Parnassus?

I found it not, where solemn Alps and gray
Draw purple glories from the new-born day;
Nor where huge sombre pines loom overhanging
Niagara's rainbow spray.

Nor in loud psalms whose palpitating strain
Thrills the vast dome of Buonarroti's fane:
On canvas quick with Guido's earnest passion,
Or Titian's statelier vein.

Tennyson indeed! Who prates about Tennyson? Were not his own sonorous round-mouthed verses worth every bit as much as many Tennysons? He repeated them over lovingly to himself. The familiar ring intoxicated his soul. He was a poet too. He would yet make a fortune, for himself and for Elsie!

Echoes, echoes, mere echoes all of them! But to Hugh Massinger, in his parental blindness, quite as good and true as their inspired originals. So the minor poet for ever deceives himself.

Guido, to be sure, he now knew to be feeble. He had outlived Guido, and reached Botticelli. Not that the one preference was any profounder or truer at bottom than the other; but fashion had changed, and he himself had changed with it. He wrote those verses long, long ago. In those days Guido was not yet exploded. He wished he could find now some good disyllabic early Italian name (with the accent on the first) that would suit modern taste and take the place in the verse of that too tell-tale Guido.

For Elsie was alive, and he must be a poet still. He must build up a fortune for himself and for Elsie.

Somebody touched his elbow as he sat there. He looked up, not without some passing tinge of annoyance. What a bore to be discovered! He didn't want to be disturbed or recognised just then—at Monte Carlo—and with Winifred lying dead on her bed at San Remo!

It was a desultory London club acquaintance—a member of the Savage—and with him was the man who had come with Hugh in the train from Mentone.

'Hullo, Massinger,' the desultory Savage observed complacently: 'who'd have ever thought of meeting you here. Down in the South for the winter, or on a visit? Come for pleasure, or is your wife with you? Whitestrand too much for you in a foggy English November, eh?'

Hugh made up his mind at once to his course of action: he would say not a single word about Winifred. 'On a visit,' he answered, with some slight embarrassment. 'I expect to stop only a week or two.' As a matter of fact, it was not his intention to remain very long after Winifred's funeral. He was in haste, as things stood, to return to England—and Elsie.—'I came over with your friend from Mentone this morning. Lock.'

'And he took you for a maniac, my dear boy,' the other answered with a quiet smile. 'I've duly explained to him that you are not mad, most noble Massinger; you're only a poet. The terms, though nearly, are not quite synonymous.' Then he added in French: 'Let me introduce you now to one another. M. le Lieutenant Fédor Raffalevsky, of the Russian navy.'

M. Raffalevsky bowed politely. 'I fear, Monsieur,' he said with a courtly air, 'I caused you some slight surprise and discomfort by my peculiar demeanour in the train this morning.—To tell you the truth, your attitude discomposed me. I was coming to Monte Carlo to join in the play, and I carried no less a sum for the purpose than three hundred thousand francs about my body. Not knowing I had to deal with a person of honour, I felt somewhat nervous, you may readily conceive, as to your muttered remarks

and apparent abstraction. Figure to yourself my situation. So much money makes one naturally fanciful! Monsieur, I trust, will have the goodness to forgive me.'

'To say the truth,' Hugh answered frankly, 'I was so much absorbed in my own thoughts that I scarcely noticed any little hesitation you may have happened to express in your looks and manner. Three hundred thousand francs is no doubt a very large sum. Why, it's twelve thousand pounds sterling—isn't it, Lock?—You mean to try your luck, then, *en gros*, Monsieur?'

The Russian smiled. 'For once,' he answered, nodding his head good-humouredly. 'I have a system, I believe: an infallible system. I'm a mathematician myself by taste and habit. I've invented a plan for tricking fortune—the only safe one ever yet discovered.'

Hugh shook his head almost mechanically. 'All systems alike are equally bad,' he replied in a politely careless tone. Gambler as he had always been by nature, he had too much common-sense to believe in martingales. 'The bank's bound to beat you in the longrun, you know. It has the deepest purse, and must win in the end, if you go on long enough.'

The Russian's face wore a calm expression of superior wisdom. 'I know better,' he answered quietly. 'I have worked for years at the doctrine of chances. I've calculated the odds to ten places of decimals. If I hadn't, do you think I'd risk three hundred thousand francs on the mere turn of a wretched roulette table?'

The doors of the Casino were now open, and players were beginning to crowd the gambling rooms. 'Let's go in and watch him,' Lock suggested in English. 'There can be no particular harm in looking on. I'm not a player myself, like you, Massinger; but I want to see whether this fellow really wins or loses. He believes in his own system most profoundly, I observe. He's a very nice chap, the Paymaster of the Russian Mediterranean squadron. I picked him up at the Cercle Nautique at Nice last week; and he and I have been going everywhere in my yacht ever since together.'

'All right,' Hugh answered, with the horrible new-born careless glee of his recent emancipation. 'I don't mind twopence what I do to-day. *Vogue la galère!* I'm game for anything, from pitch-and-toss to manslaughter.' He never suspected himself how true those casual words of the stock slang expressions were soon to become. Pitch-and-toss first, and afterwards manslaughter.

They strolled round together to the front of the Casino, that stately building in the gaudiest Hausmannised Parisian style, planted plump down with grotesque incongruity beneath the lofty crags of the Maritime Alps. The palace of sin faces a large and handsome open square, with greensward and fountains and parterres of flowers; and all around stand coquettish shops, laid temptingly out with bonnets and jewelry and æsthetic products; for people who win largely disburse freely, and many ladies hover about the grounds, with fashionable dresses and shady antecedents, by no means slow to share the good fortune of the lucky and all too generous hero of the day. Hugh mounted the entrance staircase with the rest of the crowd, and pushed through the swinging glass doors of the Casino. Within, they came

upon the large and spacious vestibule, its roof supported by solid marble and porphyry pillars. Presentation of their cards secured them the right of entry to the *salles de jeu*, for everything is free at Monte Carlo—except the tables. You may go in and out of the rooms as you please, and enjoy for nothing—so long as you are not fool enough to play—the use of two hundred European newspapers, and the music of a theatre, where a splendid band discourses hourly to all comers the enlivening strains of Strauss and of Gungl. But all that is the merest prelude. The play itself, which forms the solid core of the entire entertainment, takes place in the gambling saloons on the left of the Casino.

Furnished with their indispensable little ticket of introduction, the three newcomers entered the rooms, and took their place tentatively by one of the tables. The Russian, selecting a seat at once, addressed himself to the task like one well accustomed to systematic gambling. Hugh and his acquaintance Lock stood idly behind, to watch the outcome of his infallible method.

And all the time, alone at San Remo, Winifred's body lay on the solitary bed of death, attended only at long intervals by the waiting-women and landlady of the shabby *pension*.

CHAPTER XLIV.—'LADIES AND GENTLEMEN, MAKE YOUR GAME!'

Though play had only just begun when Hugh and his companions entered the saloon, the rooms were already pretty well crowded with regular visitors, who came early to secure their accustomed seats, and who leant forward with big rolls of gold piled high in columns on the table before them, marking down with a dot on their tablets the winning numbers, and staking their twenty or thirty napoleons with mechanical calmness on every turn of that fallacious whirlingig. Hugh had often heard or read sensational descriptions of the eagerness depicted upon every face, the anxious gaze, the rapt attention, the obvious fascination of the game for its votaries; but what struck him rather on the first blush of it all was the exact opposite: the stolid indifference with which men and women alike, inured to the varying chances of the board, lost or won a couple of dozen pounds or so on each jump of the pea, as though it were a matter of the supremest unconcern to them in their capacity of gamblers whether they or the bank happened to take up each particular little heap of money. They seemed, indeed, to be mostly rich and *blase* people, suffering from a chronic plethora of the purse, who could afford to throw away their gold like water, and who threw it away carelessly out of pure wantonness, for the sake of the small modicum of passing excitement yielded by the uncertainty to their jaded palates.

Nevertheless, he remarked with surprise from the very first moment that even at that early hour of the morning, when the day's work had hardly yet got well under weigh, the rooms, though large and lofty, were past all belief hot and close, doubtless from the strange number of feverish human hearts and lungs, all throbbing and panting their suppressed excitement, in that single Casino, and warming the air with their internal fires. He raised his eyes and glanced

for a moment around the saloon. It was spacious and handsome, after its own gaudy fashion, richly decorated in the Mauresque style of the Spanish Alhambra, though with far less taste and harmony of colour than in the restorations to which his eye had been long familiarised in London and Sydenham. At Monte Carlo, to say the truth, a certain subdued tinge of vulgar garishness just mars the native purity of the style into perfect accord with the nature and purposes of that temple of Mammon in his vilest avatar.

Hugh, however, for his part had no scruples in the matter of gambling. He gazed up and down at the ten or twelve roulette tables that crowded the *salles de jeu*, with the utmost complacency. He liked play, and it diverted him to watch it, especially when the man he meant to observe was the propounder of a new and infallible system. Infallible systems are always interesting: they collapse with a crash—amusing to everybody except their propounder. He bent his eyes closely upon the hands of the Russian, who had now pulled out his roll of gold and silver, and was eagerly beginning to back his chosen numbers, doubtless with the blind and stupid confidence of the infatuated system-monger.

Raffalevsky, however, played a cautious opening. He started modestly with four five-franc pieces, distributed about on a distinct plan, and each of them staked on a separate number. The five-franc piece, in fact, is the minimum coin permitted to show its face on those aristocratic tables; and six thousand francs is the maximum sum which the bank allows any one player to hazard on a single twist of the roulette: between these extreme limits, all possible systems must needs confine themselves, so that the common martingale of doubling the stakes at each unsuccessful throw becomes here practically impossible. Raffalevsky's play had been carefully calculated. Hugh, who was already well versed in the mysteries of roulette, could see at a glance that the Russian had really a method in his madness. He was working on strict mathematical principles. Sometimes he divided or decreased his stake; sometimes, at a bound, he trebled or quadrupled it. Sometimes he plunged on a single number; sometimes for several turns together he steadily backed either red or black, *pair* or *impair*. But on the whole, by hap or cunning, he really seemed to be winning rapidly. His sustained success made Hugh more anxious than ever to watch his play. It was clear he had invented a genuine system. Might it be after all, as he said, an infallible one?

If only Hugh could find it out! He must, he would marry Elsie. How grand to marry her, a rich man! He would love to lay at Elsie's feet a fortune worthy of his beautiful Elsie.

Things were all changed now. He had something to live, to work, to gamble for! If only he could say to his recovered Elsie: 'Take me, rich, famous, great—take me, and Whitestrland, no longer sand-swept. I lay it all in your lap for your gracious acceptance—these piles of gold—these heaps of coins!' But he had nothing, nothing, save the few napoleons he carried about him. If he had but the Russian's twelve thousand pounds now! he would play and win—win a fortune at a stroke for his darling Elsie.

Fired with the thought, he watched Raffalevsky more closely than ever. In time, he began to perceive by degrees upon what principle the money was so regularly lost and won. It was a good principle, mathematically correct. Hugh worked it out hastily on the back of an envelope. Yes, in one hundred and twenty chances out of one hundred and thirty-seven, a man ought to win ten louis a turn, against seven lost, on an average reckoning. At last, Raffalevsky, after several good hazards, laid down five louis boldly upon 24. Hugh touched his shoulder with a gentle hand. 'Wrong,' he murmured in French. 'You make a mistake there. You abandon your principle. You ought to have backed 27 this time.'

The Russian looked back at him with an angry smile; so slight a scratch at once brought out the Tartar. 'Back it yourself, then, Monsieur,' he said sullenly. 'I make my own game.—Pray, don't interrupt me. If your calculations go so very deep, put your own money down, and try your luck against me. *My* principles, when I first discovered them, were not worked out on the back of an envelope.'

The gibe offended Hugh. In a second he saw that the fellow was wrong: he was misinterpreting the nature of his own discovery. He had neglected one obvious element of the problem. The error was mathematical: Hugh snapped at it mentally with his keen perception—he had taken a first in mathematics at Oxford—and noted at once that if the Russian pursued his present course for many turns together he was certain before long to go under hopelessly. For the space of one deep breath he hesitated and held back. What was the use of gambling with no capital to go upon? Then, more for the sake of proving himself right than of winning money, he dived into his pocket with a sudden resolution, and drawing forth five napoleons from his scanty purse, laid them without a word on 27, and awaited patiently the result of his action.

'The game is made,' the croupier called out as Hugh withdrew his hand. After that warning signal, no stakes can be further received or altered. Whir-r-r went the roulette. The pea span round with whizzing speed. Hugh looked on, all eager, in a fever of suspense. He half regretted he had backed 27. He was sure to lose. The chances, after all, were so enormous against him. Thirty-six to one! If you win, it's a fluke. What a fool he had been to run the risk of making himself look small in this gratuitous way before the cold eyes of that unfeeling Russian.

He knew he was right, of course: 27 was the system. But a sensible system never hangs upon a single throw. It depends upon a long calculation of chances. You must let one risk balance another. Raffalevsky had twelve thousand pounds to fall back upon. If he failed once, to him that didn't matter: he could go on still and recoup himself in the end by means of the system. Only under such circumstances of a full purse can any method of gambling ever by any possibility be worth anything. Broken reeds at the best, even for a Rothschild, they must almost necessarily pierce the hand that leans upon them if it ventures to try them on a petty scrap of pocket capital. And Hugh's

capital was grotesquely scrappy for such a large venture—he had only some seventy-five pounds about him.

How swift is thought, and how long a time it seemed before the pea jumped! He had reasoned out all this, and a thousand-fold more, in his own mind with lightning speed while that foolish wheel was still whirling and spinning. If he won at all, it could only be by a rare stroke of fickle fortune. Thirty-six to one were the odds against him! And if he lost, he must either leave off at once, or else, in accordance with the terms of the system, stake ten louis next turn on 14, or nine louis on odd or even. At that rate, his poor little capital would soon be exhausted. How he longed for Raffalevsky's twelve thousand to draw upon. He would feel so small if 27 lost. And if there was anything on earth that Hugh Massinger hated it was feeling small: the sense of ignominy, and its opposite the feeling of personal dignity, were deeply rooted in the very base and core of his selfish nature.

At last the pea jumped. A breathless second! The croupier looked over at it and watched its fall. 'Vingt-sept,' he cried in his stereotyped tone. Hugh's heart leapt up with a sudden wild bound. The fever of play had seized on him now. He had won at a stroke—a hundred and seventy-five louis.

Here was a capital indeed upon which to begin. He would back his own system with this against Raffalevsky's. Or rather, he would back Raffalevsky's discovery, as rightly apprehended and worked out by himself, against Raffalevsky's discovery as wrongly applied and distorted through an essential error of detail by its original inventor.

It was system pitted against system now. The croupier raked in the scattered gold heaped on the various cabalistic numbers, squares, and diamonds—and amongst them, Raffalevsky's five napoleons upon 24. Then he paid the lucky players their gains; counting out three thousand five hundred francs with practised ease, and handing them to Hugh, who was one among the principal winners by that particular turn. In two minutes more, the board was cleared; the wooden cue had hauled in all the bank's receipts; the fortunate players had added their winnings to the heap before them; and all was ready for a further venture. 'Messieurs et mesdames, faites le jeu,' the harsh voice of the croupier cried mechanically. The players laid down their stakes once more; the croupier waited the accustomed interval. 'Le jeu est fait,' he cried at last; and the pea again went buzzing and whizzing. Hugh was backing his system this time on the regular rule: three louis on the left-hand row of numbers.

He lost. That was but a small matter, of course. He had won to begin with; and a stroke of luck at the first outset is responsible for the greater part of the most reckless playing. Time after time he staked and played—staked and played—staked and played again, sometimes losing, sometimes winning; but on the whole, the system, as he had anticipated, proved fairly trustworthy. The delirium of play had taken full possession of him, body and soul, by this time. He was piling up gold; piling it fast;

how fast, he never stopped to think or count: enough for him that the system won: as long as it won, what waste of time at a critical moment to stop and reckon the extent of his fortune.

He only knew that every now and then he thrust a fresh handful of gold or notes into his pocket—for Elsie—and went on playing with feverish eagerness with the residue of his winnings left upon the table.

By two o'clock, however, he began to get hungry. This sort of excitement takes it rapidly out of a man. Lock had disappeared from the scene long since. He wanted somebody to go and feed with. So he leaned over and whispered casually to Raffalevsky: 'Shall we turn out now and take a mouthful or two of lunch together?'

Raffalevsky looked back at him with a pale face. 'As you will,' he said wearily. 'I'm tired of this play. Losses, losses all along the line. The system breaks down here and there, I find, in actual practice.'

So Hugh had observed with a placid smile for the last hour or two.

They left the tables, and strolled across the square to the stately portals of the *Hotel de Paris*. Hugh was in excellent spirits indeed. 'Permit me to constitute myself the host, monsieur,' he said with his courtliest air to Raffalevsky. He had won heavily now, and was in a humour on all grounds to spend his winnings with princely magnificence.

The Russian bowed. 'You are very kind, monsieur,' he answered with a smile. Then he added, half apologetically, at the end of a pause: 'And after all, it was my own system.'

The carte was tempting, and money was cheap—cheaper than in London. Hugh ordered the most sumptuous and recherché of luncheons, with wine to match, on a millionaire scale, and they sat down together at the luxurious tables of that lordly restaurant. While they waited for their red mullet, Hugh pulled out a stray handful of notes and gold and began to count up the extent of his winnings. He trembled himself when he saw to how very large a sum the total amounted. He had pocketed no less in that short time than fourteen hundred louis! Fools that plod and toil and moil in London for a long, long year upon half that pittance! How he pitied and despised them! In three brief hours, by the aid of a system, he had won offhand fourteen hundred louis!

He mentioned the sum of his winnings with bated breath to the unsympathetic Russian. Raffalevsky bit his lip with undisguised jealousy. 'And I,' he said curtly, in a cold voice, 'have dropped sixteen hundred.'

It's wonderful with what placid depths of heroism the winners can endure the losses of the losers. 'Never mind, my friend,' Hugh answered back cheerily. 'Fortune always takes a turn in the long-run. Her wheel will alter. You'll win soon. And besides, you know, you have an infallible system.'

'It's the cursed system that seems to have betrayed me,' the Russian blurted back with a savage outburst of unchecked temper. 'It worked out so well on paper, somehow; but on these precious tables, with their turns and their evolutions, something unexpected is always bobbing

up to spoil and prevent my legitimate triumph. Would you believe it, now, last turn but one, and the turn before it, I had calculated seven hundred and twenty-two distinct chances all in my favour to a miserable solitary one against me: and not one of the seven hundred and twenty-two good combinations ever turned up at all, but just the one beastly unlucky conjunction that made against me and ruined my speculations. You might play for seven hundred and twenty-two turns on an average again without that ever happening a second time to confound you.'

AUTOGRAPHS.

Of all the collecting manias of the present time, that of accumulating autographs is not only one of the most luring, but one of the most instructive. Nearly all of us seem possessed of a natural love for collecting something. The school-boy gloats over his postage stamps, and longs for certain three-cornered and oval specimens; the naturalist thinks his collection of birds' eggs and dried skins *par excellence*; the mineralogist delights in ticketing and arranging his precious wonders from beneath the earth's surface; and the lover of character and genius treasures up in a costly album fragments of thought and letters written by the hands of great men of the past and present.

It is an error to imagine that the autograph collector merely thirsts for the signatures of his heroes; the signature truly is a *sine quâ non*, but it must be at the end of a letter, dated, and containing some sentence or phrase likely to display something of the true character or work of the writer. More of the actual character of a man may occasionally be gathered from one letter than from a whole lifetime of public writing or public service. A signature cut from a letter, or a franked envelope, is considered next to valueless unless the signature be that of some person who seldom or never wrote long letters in his or her own hand. A holograph letter of our kings and queens is a thing seldom or never seen, so a document signed by any of them has to be accepted by the autograph collector. It is not the autographs of crowned heads and other persons who have become famous simply by virtue of their office that the true lover of autographs is eager for, but rather letters by such men as Thackeray, Dickens, Byron, Tennyson, Pitt, Disraeli, Gladstone, Stephenson, Johnson, Lamb, Lytton, and Carlyle. Documents written by Spenser, Raleigh, Marlowe, Ben Jonson, Bacon, &c., are so rare that the hope of ever possessing such is seldom entertained by even the most enthusiastic collectors who have the best of chances at their command. Autograph collecting is not, therefore, a mere whim, but rather a pursuit, taken up with the idea of gleaning from their letters the real characters of great men and women, and the studying of the writing formed by the mind and hand of men such as the author of *Pendennis*; or of the man who, after ten years' sorrowing and solitude, immortalised his departed friend in *In Memoriam*. Putting aside the hard and fast rules laid down by persons who make a profession of delineating character from chirography, we seem to possess

a kind of instinct by which we can glean something of a man from his handwriting.

Unpublished fragments of prose and verse are highly prized by the collector, as are also letters containing literary and other advice, short criticisms of men and books, and proofs of friendship and love.

Apart from those collectors who devote their albums to autographs of popular and great men generally, there are many who make collections of the letters of men of a certain calling or a particular period. The Commonwealth is a very favourite subject, and letters and signatures of Cromwell and his contemporaries are becoming very scarce. The writer of this paper has devoted his collection to poets, and it contains nearly two hundred good letters, with but very few duplicates; the collection includes letters and fragments by Burns, Campbell, Longfellow, Keats, Poe, Goethe, Goldsmith, Scott, Wordsworth, Pope, Cowper, Willis, Gray, Coleridge, Tennyson, Holmes, Hood, Swinburne, Browning, Lewis Morris, and Edwin Arnold. Another collection with which the writer is familiar is devoted wholly to the Dr Johnson period, and contains specimens of Johnson, Boswell, Goldsmith, Robertson, Burke, Hume, Smith, Gibbon, Garrick, Fielding, Richardson, Walpole, and Smollett. It is well known that our Queen has a very fine collection of autographs. The British Museum contains a very large number of autographic rarities; but it is usually said that the authorities there allow many documents of interest at sales to go to America, and thus be lost to us probably for ever. The Americans are great collectors, and by no means are they afraid of paying well for anything really good. A complete set of the signers of the Declaration of Independence was sold at the hammer a short while ago for no less than five hundred pounds.

The precise value of an autograph is always doubtful; from one shilling to three hundred pounds is about the usual range, and a pretty wide range too. An A. L. S. (that is, autograph letter signed) by Burns is usually valued at about eighteen pounds; but a long manuscript (published) of his was recently disposed of in a London auction room for two hundred and five pounds. An A. L. S. of Cowper is worth about four or five pounds; of Keats, about ten or twelve pounds; of Tennyson, about one or two pounds; of Browning, one pound or more; of Dickens, about two pounds; of Thackeray, quite double that; of Ruskin, about one pound or less; of Gladstone, about ten shillings; a sign-manual of the Queen, about one pound; of Charles I., about three pounds; an A. L. S. of Darwin, about two pounds; of Carlyle, about two pounds; of Johnson, nearly ten pounds; of Flaxman, about two pounds; and of Cruikshank, about two pounds. The autograph of a peer who is only a peer is valueless. Several large collections have been sold at the hammer two or three times over in this century, each occasion the price obtained being nearly double that of the previous time; that is, if not less than ten or fifteen years has intervened. Interesting state documents, orders to commanders, orders for executions, &c., often crop up, and generally sell at high prices.

It is usually the work of a lifetime to get

together a good collection of autographs, particularly when money is an object. Those who are anxious to have such must never be in a hurry; chances must be waited for, and never missed when they present themselves. Old family papers and any old documents that may be come across should always be ransacked. An autograph letter of any great person can always be begged of those who happen to have such, without feeling under obligation, if the donor is not a collector himself. What can be the use of just one or two interesting letters? The very prevalent method of writing letters, particularly 'catch' letters, to great persons for the sake of getting their handwriting is a poor way of making a collection, and such specimens cannot give much insight into the real character and style of the writer. Some men write many more letters than do others; epistles of all sorts of Charles Dickens are still fairly plentiful, whilst those of Thackeray are getting very scarce, as also are those of the poet-laureate, who is not easily inveigled into writing letters, and therefore it may safely be presumed that good letters of his will in a few years' time become valuable.

Autograph collecting brings us into close contact with many a man too often passed by as a nobody; and a well-arranged album, with portraits and notes added to the specimens, often leads us to view our great men in a new and better light, and it helps to keep fresh in our memories the names of those who are living, or have lived and died, in the public service.

BOLSOVER BROTHERS.

IN FOUR CHAPTERS.

By T. W. SPEIGHT.

CHAPTER I.

'I TRUST, Wally, my boy, that you have not forgotten your promise—the solemn promise you gave me twelve months ago—to have nothing more to do with the turf, and never again to wager even as much as a shilling on a horse as long as you live. You have not forgotten—eh, now?'

'I have not forgotten, uncle—it is impossible that I ever should forget.'

'It does me good to hear you say that. Stick to your promise, my boy, and all may yet be well with you.—You tell me that your practice is increasing—very slowly, it may be, but still surely, which is as much as you can reasonably expect, seeing that it's only a little over a couple of years since you settled here. People have not had time to make your acquaintance, or to discover what a very clever young practitioner they have in their midst in the person of Mr Walter Lindley, F.R.C.S.'

The speaker, a fussy but good-natured elderly gentleman, lay back in his chair, and his ruddy visage broke into a broad smile. Then looking at his watch, he started to his feet. 'I mustn't stay another minute, or I shall miss the seven o'clock train,' he said. 'I shall hardly see you again before Christmas Day, when I hope we shall eat our turkey together, as we did last year; and I fancy I know where there's a drop of fine

old port to be found, although some people will persist in telling you that there's none to be had nowadays worth drinking.'

As uncle and nephew stood for a few moments at the door before parting, the former holding Walter's hand in his, said: 'Above all things, my boy, don't allow yourself to get down-hearted. That's not a bit of good. The struggle is no doubt a tough one just at present; but it ought only to serve to brace your sinews and make you more resolute to succeed in the end. In my opinion, there's no worse way of serving a young fellow than by making things too easy for him at the beginning of his career. But come what may, Wally, let no temptation induce you to break your promise.'

A minute later, Mr Tobias Lindley was trudging cheerily along on his way to the station. His nephew, after a glance up and down the quiet lamp-lighted street, turned indoors with a shiver and shut the door.

Medbury Royal, as all Londoners know, or ought to know, is situated some dozen or thirteen miles outside the metropolitan radius. It is said to be so called because at one time it could boast of having a royal residence in its midst, of which, however, not one stone is now left standing on another; indeed, the very site of the palace is so doubtful and open to dispute that the antiquaries of the neighbourhood have few finer bones of contention over which to wrangle and call names. Modern Medbury is a thriving little town, rendered still more busy and prosperous since two lines of railway have brought it within an hour's ride of the City; as a consequence of which a number of busy bees have found it a desirable place to flit to of an evening, away from the noise and uproar of the great hive where they make honey all day long. Streets and terraces of more or less pretentious villas and 'desirable residences' have sprung up like mushrooms on every side of the quaint old town: and if the old-fashioned quiet and semi-rurality of the place have disappeared for ever, the tradespeople and others are well contented that it should be so, seeing that where they had one customer twenty years ago, they can now count upon a dozen.

When Mr Tobias Lindley made up his mind to start his nephew in life as a medical practitioner on his own account, it seemed to the shrewd ex-linendraper that the young man could not do better than try his fortune at Medbury Royal; and there, accordingly, Walter was duly established. His uncle had agreed to allow him a hundred pounds the first year, and fifty the second, towards his rent and other expenses; after that time it was hoped that he would be in a position to dispense with further help, which, however, would not be withholden should the necessity for it still exist.

Walter had been more than ordinarily wild and reckless in days gone by; twice had his uncle saved him from disgrace and ruin. The young man was a born gambler; for him horse-racing possessed a fascination which minds differently constituted have no conception of. It was a failing he inherited from his father, who, after ruining himself on the turf, had put an end to his existence. After saving his nephew for the second time, Mr Tobias extorted from him a solemn promise never again to wager on a horse

as long as he lived. The promise was given in all sincerity at a time when Walter was full of the most abject contrition for his wrong-doing. On the strength of that promise, his uncle had shortly afterwards started him in practice at Medbury Royal.

Once a quarter always, sometimes oftener, the elder man made a point of 'looking up' the younger, as he called it, and it is on one of these occasions that we make the acquaintance of uncle and nephew.

Mr Tobias finding his nephew dull and out of sorts, had at once attributed his lowness of spirits to a cause which was far removed from the real one, and had striven to cheer him up with the hope of better days in store, when his name would have become more widely known and his practice treble or quadruple what it was at present. It was something far different which weighed so heavily on his nephew's heart.

When his uncle was gone, Walter went back to his little sitting-room and shut himself in. Black Care perched itself on his chair behind him. Without telling his uncle an absolute lie in the matter, he had undoubtedly led him to believe that he had had nothing whatever to do with horse-racing since the day he had given his promise to that effect, whereas the truth was that a three-months' bill for eighty pounds, which he had given in order to enable him to make good certain losses on the turf, would fall due in ten days' time, and he had not more than ten pounds in the world towards meeting it. At the time when he gave the bill he had felt morally sure that before it fell due he would not only be in a position to take it up, but would have at least a surplus of a couple of hundred pounds into the bargain. It was the old story. Certain information had been imparted to him as a profound secret that such-and-such horses could not possibly fail to win such-and-such races. The prospect was an alluring one: to Walter Lindley it proved one which he was unable to resist. He had laid all the money he could scrape together on the horses in question, not one of which had come in a winner, and the result was that ruin, absolute and irrevocable, stared him in the face. When the folly of which he had been guilty should come to his uncle's ears, and it would be impossible to keep it from him, Walter knew full well that it would be equivalent to a lifelong dismissal. Never would the elder man look upon his degenerate nephew's face again, never again permit him to cross his threshold. But bad as this might be, there was a still blacker feature in Walter's case which weighed more heavily upon him than aught else. Before being able to get his bill discounted, it was requisite that it should be 'backed' by some responsible person. That person Walter had found in a certain Mr Lobb, a retired officer of Excise, whom he had attended professionally through a rather dangerous illness; and who, in return, had contracted a great liking for the frank-seeming, pleasant-looking young doctor. Mr Lobb was an easy-going, good-hearted old bachelor; and when Walter, trumping up some story about having his rent to meet, and not being able to get in what was owing him by his patients, begged him as a great favour to endorse his little bill, Mr Lobb did so without a moment's hesitation. Unfortunately, however, there was one

peculiar feature about the transaction, unknown to any one but the young doctor himself. The bill endorsed by Mr Lobb was for eight pounds only, whereas the bill which would fall due a few days hence was for eighty pounds. Well might his soul shiver within him as he sat there in his lonely room. In flight lay his only chance of safety. He must put half the world between himself and his past life, but never could that past be redeemed. More than once he said to himself: 'Thank Heaven, my mother did not live to see this day!' And then he thought of the way his father had ended his life. He, the son, was treading the same downward path even faster than his father had done: what could he look forward to but a similar end?

His dark broodings were broken by a loud rat-a-tat at the front door, followed by a ring. He was in no mood this evening for visiting any patient; but of course if he were wanted he must go. He heard Hannah, his middle-aged house-keeper, who, with a youth in buttons—at this hour gone home for the night—formed the whole of his small establishment, cross the passage and open the door. Then came a murmur of voices, and then his sitting-room door was opened. 'A gentleman to see you, sir,' said Hannah. The gentleman walked in, and the door was shut behind him.

He was a tall, well-built man, about forty years of age, with a reddish-brown beard, rather closely cropped, and a moustache of the same hue. He had dark, keen, crafty-looking eyes, but was by no means ill-looking. He was well and fashionably dressed. A horse-shoe of brilliants glittered in his scarf, and when he took off his gloves, which he presently did, he displayed three or four rings of price. Of him it might be said, as of so many others, that he was gentlemanly looking without being a gentleman.

'I am addressing myself to Mr Walter Lindley, I presume?' said the stranger as he advanced and took off his hat.

'That is my name,' answered Walter, who had risen and now stood facing the other.

'And mine is Gazebrooke—Mr Weston Gazebrooke—a name you have probably never heard before. I have called to see you this evening on a purely private matter, thinking this would be as likely a time as any to find you disengaged.'

'Pray, be seated, Mr Gazebrooke,' said Walter, not without a slight tremor in his voice. Already the coming of this stranger seemed to him full of evil augury.

'I will come to the object of my visit without delay,' said Mr Gazebrooke, leaning forward with his elbows on the table and confronting the young surgeon. 'I have in my possession a certain bill for the sum of eighty pounds drawn by you, and accepted by a Mr Nicholas Lobb, which bill will fall due in little over a week from now. There is, I presume, Mr Lindley, no doubt as to Mr Lobb's ability to meet the bill in question on presentation?' As he put the query, his eyes were bent full on the face before him, which had faded to the hue of that of a dead man.

For a few moments Walter could not have spoken to save his life. The blow had stunned him. His eyes fell before the keen orbs that to his guilty conscience seemed to be reading him through and through. At length he made shift

to say: 'I see no reason, Mr Gazebrooke, why you should doubt Mr Lobb's ability to meet the bill any more than you might doubt that of any other person who happened to be a stranger to you.'

'Very fairly put,' replied the other. 'Still, you may take it as a fact that I should not be here this evening unless I had what seems to me ample warranty for my visit. Eighty pounds seems rather a large sum for a young man in your position—only just started in practice, as one may say—to negotiate a bill for. I presume there would be no objection to my calling upon the endorser, just by way of refreshing his memory that the eighty pounds will be due ten days from now, either from him or you, or the pair of you. Mr Lobb's house, if I am rightly informed, is only a little way from here, and— But, dear me, Mr Lindley, how dreadfully ill you look! Is there anything I can get you? Shall I ring for your housekeeper?'

'It is nothing. A spasm of the heart—a thing I'm subject to. I shall be better presently,' gasped the miserable young man.

'Ah, decidedly unpleasant, I should think, to have anything the matter with one's heart. Nothing the matter with mine, thank goodness—that is, as far as I know.' He busied himself with the papers in his pocket-book for a few moments while Walter strove to pull himself together.

'If I give you my assurance, Mr Gazebrooke,' he contrived to stammer presently, 'that the bill will be met in due course, there cannot, surely, be any reason why you should trouble Mr Lobb in the affair. I hope, sir, you do not doubt the genuineness of his signature?'

'Not at all, Mr Lindley, not at all,' answered the other with a curious little laugh; 'but what I do doubt is whether Mr Lobb is aware for what amount his endorsement has made him liable. To state the case as briefly as possible: Does Mr Lobb believe himself to be answerable for the sum of eight pounds or eighty?' Again he fixed the young doctor with his vulture-like eyes, but from the latter's frozen lips there came no response.

After a few moments of strained silence, Mr Gazebrooke drew from his pocket-book a long narrow strip of bluish paper, with a quantity of writing on it and a stamp at one corner. 'You may perhaps wonder a little, Mr Lindley, at the singularity of my question,' he went on to say, 'just as I might be surprised at your hesitation in answering it—only I'm not. However, the reason for my question is not far to seek. Here is the veritable document itself, made out in due form, for the sum of eighty pounds; but a very cursory examination of it reveals the singular fact that the letter "y" after the word "eight" and the cipher after the figure 8 have been filled in with a different ink, and presumably at a different time from the body of the acceptance; the added letter and the cipher have faded to a dullish brown tint, while the rest of the caligraphy remains as indelibly black as when first written. Now it seems to me, Mr Lindley, that should you not be in a position to explain this little anomaly, Mr Lobb might possibly be able to do so. What say you, young gentleman—what say you?'

'Nothing,' answered the other sullenly, to whom sheer desperation had lent a factitious courage for the time being. 'Go to Lobb, if it so please you. I care not what you do.' Resting his elbows on the table, he covered his face with his hands. At that moment he felt indeed as if he cared not what might become of him.

'Come, come, my friend; never say die,' remarked the other encouragingly. 'Things are seldom so bad but that they might be worse. As for this slip of paper, I won't hurt your feelings by alluding to it further. I understand all about the affair as well as if you had taken half an hour to tell me. You are not the first young fellow by many a hundred who has found himself in Queer Street. Assuming it to be a fact that you are not in a position to meet the bill, the question that presents itself is: What possible alternative is there under the circumstances?' There was a brief pause; then the stranger said interrogatively: 'Supposing I myself take up the bill when it falls due?'

Walter lifted his head from his hands and stared at the other as in doubt whether he had heard aright.

'In other words: supposing I take up the acceptance instead of Mr Lobb?' reiterated Mr Gazebrooke.

'Supposing you do—what then?' queried Walter presently. 'You are a stranger to me, Mr Gazebrooke, and strangers don't usually propose such things without having some object in view. Assuming that you take up the bill, what shall you want me to do in return?—for I'm morally sure you will expect a return of some kind. Shall you want me to administer a dose of prussic acid, or strychnine, to somebody that you are anxious to get rid of?'

Mr Gazebrooke laughed a hollow, mirthless laugh. 'No, no, my friend; I don't require anything one-quarter so terrible at your hands as that. It is creditable to the perspicacity of so young a man that you recognise already one of the hardest facts of life—that in this world nothing is to be had for nothing—that if I help you, I expect you to help me, and vice versa.—Such being the case, if I do this thing for you, it is superfluous to say that I shall expect you to do a trifle for me in return—a mere trifle, I give you my word.'

'I should like to know the nature of the "trifle" in question, Mr Gazebrooke.'

'That is a point, Mr Lindley, respecting which I am sorry to say I cannot at present enlighten you. However, as I said before, it is nothing dreadful—nothing that will in any way compromise you, or cause you to run any risk whatever.' Here he looked at his watch. 'As time is running on and I want to catch the next train back to town, I will state my proposition as concisely as possible. The bill in my possession shall be taken up by me, and neither you nor Mr Lobb shall hear a syllable more about it. Some day, it may be two, three, or even four months hence, I shall call upon you again and ask you to do me a certain little service, which will come entirely in the way of your profession and will cost you nothing. The moment the service in question is completed, the acceptance shall be handed over to you, to burn, or do whatever you like with, and all transactions between us will be at an end.'

What say you—yes or no? You must let me have your answer in two minutes.'

It is hardly necessary to say what Walter Lindley's answer was.

Time passed on. The dreaded day came and went, and for anything the young surgeon heard of the matter, no such document as the bill for eighty pounds might have been in existence. The mysterious stranger had evidently been as good as his word. Walter began to breathe more freely. The one great danger was over, and whatever might be the return required at his hands, it could hardly be of a nature to impose upon him a burden so terrible as that from which he had so narrowly escaped. It was impossible that he should feel easy in his mind while a document so fatally compromising as the one retained by Mr Gazebrooke remained in existence; but all he could do was to wait with such patience as he could summon to his aid the *dénouement* of the strange adventure in which, without any exercise of will on his own part, he found himself involved.

Five months and a fortnight had passed when one evening Mr Gazebrooke again made his appearance. 'Here I am once more,' he said with a smile, as he proffered his hand: 'come at last to claim the fulfilment of your promise. I hope you had not quite given up expecting me?'

The two men remained shut up together for upwards of an hour.

Next morning about ten o'clock, just as Lindley was getting ready to start on his first round of visits, a middle-aged woman, a domestic of some kind, to all appearance, was ushered into the surgery. 'If you please, sir,' she said, 'my master, Mr Bolsover of Laburnum Cottage, has sent me to ask you to call on him. He's caught a bad cold, and feels very queer and out of sorts this morning.'

The young doctor paused in the act of brushing his hat, and for a few seconds every vestige of colour fled from his face. His summons had come at last.

'Tell your master that I will be with him in the course of an hour,' he answered.

'If you please, sir, I be a little bit deaf,' responded the woman, putting her hand to her ear and going a step or two nearer.

Walter repeated his words in a louder tone, whereupon the woman courtesied and went.

GENTLEWOMEN IN QUEEN ANNE'S TIME.

It is common in the present day to hear much of schemes for the 'higher education of women,' of colleges where girls compete with their brothers for honours in academic learning, and of all that advance in culture of which we are so proud. But if we glance back at the domestic life of our ancestors as depicted, for instance, in the reign of good Queen Anne, shall we not be forced to own that we lack something of the industry, the energy, the household accomplishments, and the mental vigour as displayed by them? Finding what were some of the qualifications thought best to become a gentlewoman then, shall we say that our own ways are so vastly superior?

It was expected that a gentlewoman should

understand the Latin tongue, to enable her to write and speak true and good English: and that she should also master the French and Italian languages. Her reading, besides the books of piety in vogue, such as Bishop Usher's *Body of Divinity*, Mr Firman's *Real Christian*, and others, embraced those romances which treated of gallantry and virtue, whose old-fashioned names of *Chelia*, *Grand Cyrus*, *Parthenessa*, Sir Philip Sidney's *Arcadia*, &c., have passed from the range of modern book-lists, though the last-named may chance to be met with still, albeit but little read by our girls. She was also expected not to neglect authors in foreign tongues, by which her fancy might be tickled or her understanding furnished; and yet she was enjoined, when in public society, 'to tip her tongue with silence,' though 'not to be altogether silent, for that is a misbecoming error, but in speaking, to do it knowingly and opportunely.'

In the rush of life in these railroad and electric days, do not some of us almost sigh for the leisurely time when a gentlewoman also counted among her accomplishments, over and above singing, dancing, and playing on several sorts of musical instruments, these: 'Making all manner of pretty toys for closets. Frames for looking-glasses, pictures, or the like. Feathers of crewel for the corner of beds. Preserving all kinds of sweetmeats wet and dry. Setting out of banquets. Making salves, ointments, waters, cordials; healing any wounds not desperately dangerous. Knowledge in discerning the symptoms of most diseases, and giving such remedies as are fit in such cases. Limning. All manner of cookery. Great skill in all kinds of works wrought with a needle. Washing black or white sarsnets. Making sweet powders for the hair or to lay among linen.'

Surely, then, on the faces of the young girls, as their varied employments called forth sympathies and resource, there was none of the lassitude and melancholy that one can but notice with regret among the fashionable maidens of our day. The mere making of 'salves, ointments, and cordials' must, we think, have gone far to heal any wounds of their own 'not desperately dangerous.' And we can imagine the glow of healthy employment their cheeks would wear after the 'washing of black or white sarsnets,' to say nothing of the deeper tint displayed when they came forth from instruction in 'all manner of cookery,' with buoyant step, and dignified with a sweet content.

With us, a refined civilisation in removing the need for household production of various sorts has brought about the fact of an immense number of unemployed women, who have, as it were, to make work for themselves, which has none of the warm interest inspired by necessary or useful labour, and has set ennui and listlessness in our midst. Though we must own that this same civilisation has weeded out some uncouth behaviour which ill befitted gentlewomen; for what a shock our sensibilities would receive could we be present at table in 1672, when such advice as this to ladies was necessary: 'Fill not your mouth so full that your cheeks shall swell like a pair of Scotch bagpipes; neither cut your meat into too big pieces. Gnaw no bones with your teeth, nor suck them to come at the marrow. Be cautious and not over-forward in dipping or sopping in the

dish. Do not bawl out aloud for anything you want, as: "I would have some of that," "I like not this," "I hate onions," "Give me no pepper;" but whisper softly to one, that he or she may without noise supply your wants. In carving at your own table, distribute the best pieces first, and it will appear very comely and decent to use a fork; if so, touch no piece of meat without it. I have been invited to dinner where I have seen the good gentlewoman of the house sweat more in cutting up of a fowl than the cookmaid in roasting it; and when she had soundly beliquor'd her joints, hath suckt her knuckles, and to work with them again in the dish.

Poor lady! The emancipation of 'diner à la Russe' was not for her, and whether she would or not, 'sweat' she must over her work until she had obtained the mastery of the commendable art of cookery; ay, and she must too, would she be considered a complete housewife, learn the quaint terms used at home and abroad for dividing various sorts of food, as it was proper to say: 'Thigh that woodcock, thigh that pigeon; Mince that plover; Wing that quail, wing that partridge; Allay that pheasant; Untach that curlew, Unjoint that bittern; Disfigure that peacock; Display that crane; Dismember that hern; Unbrace that mallard; Fruit that chicken; Spoil that hen; Sauce that capon; Lift that swan; Rear that goose; Tire that egg, &c.

Let us hope that time and patience enabled her at last to deal with even so noble a bird as a swan, and that she could 'lift' it to her own and her friends' satisfaction. But it may be she was more skilful with the pen than with the knife, and was so polished in the matter and form of her compositions that we should scarcely believe—had we perused her writings—that they would have come from the same hand that played such an ungraceful part in the dish. It is not given to each to excel in all, and we may well believe that carving was her least virtue. To write well was esteemed an essential part of a woman's education, and it may be a fitting finish to our sketch if we learn something of the epistolary style then in vogue, as shown in the following letter. It is from a daughter in answer to her mother, who would have persuaded her from wearing spots and black patches on her face. Thus:

MADAM—It is as well religion as duty in me to render you all observances, which I shall make my delight as well as employment. My greatest blessing is the continuance of your love, which obligeth me to increase my thankfulness as well as my obedience. I perceive some censorious tongue hath been too busy with my face, and hath endeavoured to throw dirt on it, because it hath been lately spotted in the fashion, a fashion that hath as much innocence to plead for its excuse as custom for its authority. Venus the goddess of beauty was born with a *motticella*, or natural beauty-spot, as if nature had set forth a pattern for art to imitate. You may see every day some little clouds over the face of the sun, yet he is not ashamed of his attraction; nay, some of late with an optick-glass have discovered some *maculæ* or spots in the very face of the sun, yet they are not attributed as his deformities. The moon, when she is at full and shining in her greatest lustre, hath in her face some remarkable

spots, and herein is placed her chiefest glory, as being in everything inconstant but in this. When I put on my mask, which is no more nor better than one great patch, you do commend me for it; and will you be displeased with me for wearing a few black patches? which, if they are cut into stars, do represent unto me whither I would go; or if into little worms, whither I must go: it is the unhappiness of the most harmless things to be subject to the greatest misconstruction. Black bags on the head are not much older than the black spots on the face, and much less may be said for them, only they have had the good luck in the city not to meet with contradiction, although in the country they are much cavil'd at unless worn by gentlewomen of eminent note and quality. Nevertheless, according to the obligation of my duty to give you in all things satisfaction, I am determined to wear them no more, not that I find any such vanity in them, but that by the fruits of my obedience you may perceive what an absolute power your commands have over her who is, Madam, Your most humble and most obedient daughter. S. M.

Here is a style as alien from the popular post-card and sixpenny telegram as is the instantaneous photograph from a carefully painted miniature. All good in their own time and place; but let us beware lest our day should aptly illustrate the proverb of 'Much haste less speed,' for in some of our works we may find ourselves behind instead of in advance of those whom we are accustomed to consider as inferior to ourselves in learning and general culture.

THE MOCKING-BIRD.

JOHN WALLER carefully timed his murderous visit to Daniel Jaggard's bungalow. Jaggard's nigger, Quash, was out of the way, picking oranges for the market from the grove by the river-side. There was no living creature within half a mile of them, when he stepped into the room where Jaggard was sitting writing. A mocking-bird of course did not count. The bird was in a large cage in one corner of the room, while Jaggard's table was by the window fronting the pine-forest.

'You, John!' exclaimed Jaggard, laying down his pen. 'Well, I'm glad to see you. Sit down.'

'No,' said Waller. 'Reckon it's not pleasure I'm here for; it's downright business. Once for all, will you leave Sybil Macdonald to me? It's an old tale by this, and I'm not going through it again. Before you came, she cottoned to me, and no other man. I'm mad on her.—But it's different since'—

'My good man'—

'None o' that.—Yes or no?'

'Well, certainly "No" in that case.'

'Then, by thunder, your last minute has come.'

They were both strong men, at their strongest, but Jaggard was taken unawares. Waller's bowie was in him to the hilt before he could stand up. With a sob of pain, he sidled heavily to the ground in a widening pool of blood. The stab was mortal. He groaned, writhed, tried

to lift himself on his elbows, gasped forth the words, 'John did it,' and was then seized by the death-agony, and died. Waller, who had narrowly watched the whole scene, shrugged his shoulders, wiped the knife upon his victim's clothes, and left the house.

During the progress of this tragedy the mocking-bird had stood to attention, with its head on one side. Only by an occasional quick nervous movement of its long tail did it show sign of life. But when Waller had left the room and stealthily glided into the pinewoods adjacent to the house, then, with erect head and a grand air, the bird mimicked the gruesome spectacle from beginning to end. It gave the various intonations of the two men in their brief interchange of speech; and finished with a wondrous mockery of the dying efforts of its master. This done, the bird stalked to a piece of meat at one end of its cage, and dined to its contentment.

Now, when this sad occurrence came to be discussed, it seemed clear to every one that Quash, the nigger, had murdered his master. What more obvious? Quash was a peculiar man, even for a ducky. His emotion over Jaggard's body was pronounced exaggerated. It was indeed the sublime of black cunning. They carried him off to the prison-house of Waterville, and put his very tears and wailing about the goodness of the man who was dead in the balance against him. There was talk about lynching him. But that the City Marshal took pains to guard against. The City Marshal had a long white beard and a broad brow. He was the Nestor of Hernando county, and he said that it was possible Quash was not the culprit. This oracular ruling saved the nigger.

Among all the orange growers round Waterville none were more interested in the murder than Mrs Macdonald and her daughter Sybil. They had emigrated from England in 1884. Mrs Macdonald was a masterful woman. Sybil was nineteen, with purpled eyes beautiful to look upon, notwithstanding the swart complexion she owed to the Florida sun. It was these purpled eyes that had fascinated Waller. By-and-by, when Jaggard arrived and took up land in the neighbourhood, he also sacrificed to them. Sybil respected Waller as a shrewd steady worker, sure of a competence in a few years. Jaggard she grew to love, though he was poor. But to Mrs Macdonald there was no crime like poverty, and so Sybil had kept her love in her own heart. However, Jaggard had learnt to read in her eyes, and he understood her. Therefore, when the murder was bruited, the shock to the Macdonalds was great, and to Sybil, stunning. 'Mother,' she said quietly, when they had brought over the news, 'I believe I could kill that wicked brute if he were here—kill him with my own hands.'

'It will be all one to Quash in the end whether you or the Marshal kill him,' remarked Mrs Macdonald. 'I guess he'll hang ere this day week.'

It was decided to hold the inquiry in Jaggard's own room. In the interval the house had been put in charge of a poor Seminole who had wandered up into Hernando county. He knew little English, but that little was more than enough, as he had no one to talk to except the mocking-bird, whom, with the craft of a child of nature,

he coaxed into the utterance of a multitude of excruciating noises.

The room was filled, and a block of people stood outside also, between the open window and the pine-forest. All Jaggard's intimate acquaintance had been subpoenaed. Thus the Macdonalds and John Waller himself were there—Sybil and Waller looking somewhat uncomfortable; but Mrs Macdonald with merely a tight mouth, as if she resented such an unprofitable waste of time. Quash, with bracelets on and shedding tears as fast as he could, was present of course. Never did an innocent nigger offer so pitiable a spectacle as he. But no one compassionated him. The only pity at his service was what he might receive from the cold barrels of seven or eight six-shooters.

This lively gathering in the room which it had been wont to consider sacred to itself and its master (whom it loved in bird-fashion), at first frightened the mocking-bird. It tried to obliterate itself in the darkest corner of its cage. By-and-by, however, it appeared to take an interest in the proceedings. It trod forward, inch by inch, until it was as near to the assembly as its cage permitted. Some one gave it a lump of sugar, but it neglected the sugar when the City Marshal began to speak. Quash interrupted the Marshal with a passionate repudiation of something the Marshal said. At this the bird cocked its head, and redoubled its attention.

The evidence was purely circumstantial. Quash, when called upon to defend himself, could say nothing but commonplaces. He loved Mister Jaggard too much to think of killing him—would rather put the knife into his own black bosom: and so forth. He shed additional tears, too. All which was no defence at all. And so, when he was silenced, it was apparent that he would be judged 'guilty.'

But the City Marshal was not satisfied. He had never seen a nigger weep like Quash, he said. 'I want to know something about Jaggard's personal habits,' he observed. 'Was he likely to commit suicide, for instance?—Mr John Waller, you, I think, knew him pretty well.'

'Yes, I knew him well,' replied Waller, standing up, and feeling very sick.

You should have seen the excitement of the mocking-bird when it heard Waller's voice.

'Now, what do you think about this business, Mr Waller?' asked the Marshal.

'John did it! John did it!' screamed the bird, which then, with a splutter of effort, reproduced the sounds emitted by Jaggard when he died. The noise of its wings against its cage-bars drew every eye towards it; and holding fast to the side of the cage, it once more stammered forth in low clear tones, but agonised, as if exhausted: 'John did it.' But what electrified the audience was the unmistakable imitation of a death-rattle and choke with which it favoured them. After the performance, it leaped lightly back to its centre bar, and with the toes of one leg demurely scratched its head-feathers. There was no misconstruing this mock-drama.

The City Marshal was the first to give Waller a look of scrutiny. Sybil and her mother were hardly less alert. As for Quash, his black face lit up with a sudden glory. And the assembled townspeople, having briefly wondered, were led by

the tendency of the eyes of the Marshal, the ladies, and Quash, to look where they looked. What did they see?

Waller, when he heard the bird speak, was not immensely moved; but the terrible iteration of the death-agony put a seal of veracity upon the words, and instantly he realised that his doom was upon him. An acute pain took him at the heart; he went ghastly pale; his eyes dimmed, so that he saw the eyes of his neighbours and acquaintance centred upon him as it were through a mist; and he reeled forwards, doubled upon the chair in front of him. When they tried to lift him, they found that he was dead.

'I rather guess,' observed the City Marshal, 'there's a kind of a link between the inquest we're holding to-day and the one we'll hold to-morrow which it'll be awkward to lay hands on.'

OCEAN CONCERTS.

To those who love the sea, it supplies an ever-varying source of actual and speculative pleasure. Whether it be in the physical delights of boating or sailing, walking over the ozone-laden cliffs, or sitting in dreamy self-forgetfulness where the waves plash ceaselessly against the base of the pier, the illimitable restless ocean is always enchanting to the view; whilst its near contiguity soothes the troubled mind. It is given but to a small minority of the human race thoroughly to appreciate the qualities of the mermaid's beautiful domain. Every one of course is gratified by the appearance of the sea when its placid bosom reflects in rich shades of gold and ultramarine the bright concave hemisphere of sunlit sky overhead. But to the true lover each and all of the changeful moods of his mistress are dear; and so it is with those who are wedded to this great half of nature. There is much of beauty as well as of impressive majesty in the giant waves as they dash their curling crests of tawny-coloured foam against the base of some huge rock, or seize madly upon the pebbly beach as though they would beat their way deep into the earth. And on the day succeeding a storm, what a wealth of romantic association there is in the long sweep of the yet sullen discontented roller which rebelliously submits to the prospect of peaceful calm, so gloriously heralded in by the keen clear air and cloudless sky. What cruel pitiless deeds this angry beauty may have committed in the preceding hours of relentless fury no one shall ever know, and it seems as though her inward spirit were still chafing at being balked of further excesses.

But amidst the many strange sights and sounds of which the ocean is so prolific, few can compare with what may be aptly termed an 'ocean concert.' Perhaps the first picture conveyed to the mind of the reader by such a phrase will be that of a transatlantic liner ploughing her way from Liverpool to New York, whilst in her main saloon some of the passengers are giving the time-honoured and praiseworthy 'instrumental and vocal enter-

tainment, the proceeds of which will be devoted to the funds of the Sailors' Orphanage,' the affair being precisely similar, save for the surroundings, to some hundreds of others which may be in progress at the same moment in various towns and villages of the United Kingdom. No; it is of a very different musical performance we speak, a dramatic and weird natural oratorio not often to be heard or witnessed, full of grandeur and awe and mystery. Come quietly down to the seashore and an imaginary dress-rehearsal shall take place, for the bountiful goddess of fancy will supply any necessary elements which may not be present for the occasion. The night is not dark, for the moon is high in the firmament, and her silvery rays are reproduced in a million glimmering fragments of sheen on the dancing surface of the water. The air is very still, and the waves plash quietly on the sand, whilst far away in the deep blue vista shine little dots of light, the sole indications of the presence of mighty steamers and more graceful sailing vessels.

But what is that white moving mass over there in the horizon? It is a thick wall of fog, which rapidly yet imperceptibly makes its insidious approach, and, almost before the spectator feels its chilly embrace, the fair scene of sea and sky, with the twinkling lights and the dancing moonbeams, is shut out from view, and nothing remains but an opaque luminosity, which obscures all objects except a few stones or a sand-drift at one's feet. This is but the prelude to the concert, which is speedily inaugurated by a hoarse note from the foghorn of a neighbouring steamer. One loud and long-sustained blast, and then, for a moment, silence, which is soon broken by the shrill cry of a seagull hurtling through the air *en route* to some distant cliff. And then, with a terrific concatenation of sound, the entire orchestra exerts its full force. Foghorns of every conceivable note and pitch, some hoarse and deep-toned; some shrieking in the treble clef; some tuned in double notes; some alternately ascending to a third or a fifth; some giving vent to a chord the existence of which Mozart or Beethoven never dreamed of even in their most delirious moments of harmonic conception; some in irregular spasmodic efforts breaking from B flat into F sharp, but all wild, incoherent, weird in the extreme, join in this unique double-forte passage with abnormal unison.

High over this indescribable din resounds the shrill scream of the steam-whistle, fitfully asserting its ear-splitting power by short jerky snaps or long-drawn shrieks; whilst in regular, even pulsation may be heard through all the noise the deep full clang of the warning bells on board the sailing-vessels. For fully a minute does this solemn *ensemble* continue; but at last, as though in obedience to an unseen conductor's baton, the different instruments are hushed, and the sad low song of the waves is heard, as in mournful cadence they fall on the shore, and retreat again to the watery depths, churning up the shells and pebbles and seaweed as they go.

But now another sound breaks on the ears, for in fitful irregular beats the distant bell-buoy,

faithfully performs its duty by warning the unsuspecting mariner of the whereabouts of the hidden rock on which it is anchored. No wonder that Ralph the Rover was roundly cursed by the Abbot of Aberbrothock; and full richly did he deserve the fate which met him on the self-same spot where the bell sank gurgling in the waves. For now, listen to that loud sharp whistle which travels like an arrow through the air. It is the signal that some gallant bark is about to haul in her halliards and change her course, owing to her captain having heard the guardian bell. Not for long, however, does this peaceful interlude continue.

Again does the great crash of instruments come across the water in a grand diapason, seeming as though the musicians of Pandemonium were out for a holiday, and fantastically reminding the listener of some elfin performance of the overture to *William Tell*. Yet, notwithstanding all the force of the steam-breath issuing from multitudinous brazen throats, the gentle wash of the breakers cannot be altogether stilled, whilst the invisibility of the many agents employed in this ocean cantata lends a degree of speculative mystery thereto which can only be felt, not uttered. And so the great concert goes on, becoming more weird and gruesome every moment, until suddenly the listener on the shore is aware that there has been a longer period of silence than usual. At once the mind flies to mad conjecture. What can have happened? Has there been a collision, and have two of those ponderous steamers, with their great staring eyes and huge funnels emitting dense clouds of smoke, remorselessly attacked each other, and gone down with a gurgling rush beneath the waves, accompanied by the cries and prayers of drowning men? And what a fearful fate is this. Oliver Wendell Holmes somewhere speaks of the two vessels running, from the moment they were launched, from different ends of the same groove, so that, no matter how tortuous or extended its windings, they were finally destined to crash together in its track with a sickening thud. Has one of these dread encounters taken place out there in the midst of the watery waste, and are the other vessels rendered silent with awful expectancy of the same fate? Even while such thoughts course through the brain, a veil is taken from before the eyes. As though by a magician's wish, the ocean discards its foggy shroud, the moonbeams again ripple on the water, and the fleeting lights stand out in diamond specks on the deep ultramarine carpet. So after all the fogbank has only come up from the seaward with a gentle breeze, and its white ghostlike wraiths are now vanishing over the distant hills.

Yet its advent was sufficient to cause anxiety on board every vessel in the offing.—Hark! What causes that loud throbbing sound away to the left? It is a large steamship, whose iron framework has polarised her compasses, and when the fog cleared off, her captain found that she was heading direct for the land.

As we turn to leave the grand amphitheatre which has so lately staged our ocean concert, a noise of puffing and blowing and tumbling about in the water is heard at some little distance. It is a porpoise, perhaps a descendant of the gentle-

man who aided the dolphin in his endeavour to win for Neptune the affections of Amphitrite. He also has been an auditor of the oceanic cantata, and he has evidently enjoyed it.

SOMETHING GREAT.

THE trial was ended—the vigil past;
All clad in his arms was the knight at last,
The goodliest knight in the whole wide land,
With eyes that shone with a purpose grand.
The king looked on him with gracious eyes,
And said: 'He is meet for some high emprise.'
To himself he thought: 'I will conquer fate;
I will surely die, or do something great.'

So from the palace he rode away;
There was trouble and need in the town that day:
A child had strayed from his mother's side
Into the woodland dark and wide.
'Help!' cried the mother, with sorrow wild—
'Help me, Sir Knight, to seek my child!
The hungry wolves in the forest roam;
Help me to bring my lost one home!'

He shook her hand from his bridle rein:
'Alas! poor mother, you ask in vain.
Some meaner succour will do, maybe,
Some squire or varlet of low degree.
There are mighty wrongs in the world to right;
I keep my sword for a noble fight.
I am sad at heart for your baby's fate,
But I ride in haste to do something great.'

One wintry night, when the sun had set,
A blind old man by the way he met:
'Now, good Sir Knight, for Our Lady's sake,
On the sightless wanderer pity take!
The wind blows cold, and the sun is down:
Lead me, I pray, till I reach the town.'
'Nay,' said the knight; 'I cannot wait;
I ride in haste to do something great.'

So on he rode in his armour bright,
His sword all keen for the longed-for fight.
'Laugh with us—laugh!' cried the merry crowd.
'Oh weep!' wailed others, with sorrow bowed.
'Help us!' the weak and weary prayed.
But for joy, nor grief, nor need he stayed.
And the years rolled on, and his eyes grew dim,
And he died—and none made moan for him.

He missed the good that he might have done;
He missed the blessings he might have won.
Seeking some glorious task to find,
His eyes to all humbler work were blind.
He that is faithful in that which is least,
Is bidden to sit at the heavenly feast.
Yet men and women lament their fate,
If they be not called to do something great.

MEN OF THOUGHT AND MEN OF ACTION.

THERE is a well-known sentence in Lockhart's *Life of Scott* which has had perhaps undue importance attached to it. 'Scott,' says Lockhart, 'never considered any amount of literary distinction as entitled to be spoken of in the same breath with mastery in the higher departments of life. To have done things worthy to be written was in his eyes a dignity to which no man made any approach who had only written things worthy to be read.'

Scott was by nature the humblest of all men of genius, and in this respect presents a singular contrast to men like Milton and Wordsworth, who stood so loftily on the consciousness of their own powers. Milton and Wordsworth willingly recognised the conventional distinctions of society, yet in his heart each was profoundly convinced that by the special gift committed to him he was a vessel chosen to far higher uses than prince or statesman or commander. This is certainly the true mental attitude we look for in creative genius of the first order. The work of Scott is doubtless on a lower plane than the work of Milton and Wordsworth; yet in its kind it is so unique, so fruitful in influences that make glad the heart, that we feel a certain disappointment when we learn that he would have preferred to be a general or a statesman rather than the man of genius he was. But, as has been said, it is possible to attach too much importance to Lockhart's words, even though certain expressions of Scott's own may seem to support them. The opinion they suggest may be due partly to Scott's own humble estimate of himself, and they may be partly a concession to the conventions of the society in which he moved. It has often been said that of all the joys that fall to the lot of man, the highest and most enduring is the unrestrained exercise of his own best gifts. During the greatest part of his life, this good fortune was Scott's; and if his readers may trust the impression they gain from

his work, never did genius fulfil its function more happily, more free from that distemperature which nature so often makes the condition of her choicest gifts. In spite, therefore, of Scott's own word to the contrary, the very nature of things leads us to believe that in moments when he was most himself, he, like all other men of creative genius, was conscious of the real value of his endowment, and had no impotent desires to be one of the 'masters in the higher departments of practical life.'

But apart from their reference to Scott, the words of Lockhart are misleading as to the true relation in which men of thought stand to men of action. A sentence of Emerson goes far deeper, and is a far truer statement of the real relation between them. 'Homer's words,' he says, 'are as costly and admirable to Homer as Agamemnon's victories to Agamemnon.' This is said in Emerson's quaint manner; but in this remark he has sacrificed less to epigram than is often the case with him. It is but the simple truth that to the highest utterance of the poet or inspired teacher, no less than to the victories of the great commander, there must have gone all that makes human character strong and admirable. Milton and Goethe and Dante strike us as being essentially as much men of action as Cromwell or Napoleon, and this not because these poets actually took their share in the public life of their day, but because the quality of their poetical work is such that we inevitably think of them as 'kings of men.' What Heine said of Luther is, with the necessary variation, true of all great writers—their words are battles.

Whether or not Scott was of opinion that the statesman or the commander is a being of a higher order than the poet, it is certain that the feeling of inferiority has usually been on the other side. The story of Wolfe at Quebec immediately occurs to one as a curious comment on the opinion ascribed to Scott. It is satisfactory to know that the truth of this story has been put above question, since a more striking tribute was never paid to that divineness of the poet's function

which men have never failed to recognise since they began to think. When Wolfe exclaimed, as he was being rowed to the scene of his brilliant victory and untimely death, that he would rather be the author of Gray's lines than the conqueror of Quebec, he was undoubtedly but giving expression to the feeling of the best men of his type. But even in great men of action of the least scrupulous character, it is curious to note the distinct recognition of the claims higher than their own that the great men of letters have upon the world. The absurd attempts of Richelieu and Frederick the Great to distinguish themselves as poets, while they are a lamentable proof of human vanity, are certainly a notable tribute to the dignity of literary genius. The illustrious instance of Aristotle and his pupil Alexander the Great, is the impressive reminder to all these great personages of what account they are held in the final estimate of things. It is indeed when we think of such a pair as Aristotle and Alexander that the ordinary distinction between men of thought and men of action seems to break down. Which seem to us now the greater reality, the writings of the one or the victories of the other? The old conception of Alexander as a mere soldier of fortune on a large scale is no longer held. There is good reason to believe that he saw the real significance of his work in opening communication between the East and the West. Yet, as a living force in the thoughts of succeeding generations, no doubt can exist as to which, the pupil or the master, has the higher claim to consideration.

The question has of late been again renewed, as to the real importance of famous books in effecting great revolutions in human affairs. In questions of this kind, of course, dogmatic answers cannot be given. On the one hand it may be held that the tendencies to which the writer appeals are already in action, and that these tendencies are ultimately determined by the conditions of the people among whom they are found. But it may be also maintained that it is the very function of a book to evoke tendencies, and supply the inspiration necessary to realise them. The crucial test of both theories is the case of the French Revolution. Would that event have taken place at the time and in the manner it did, if Voltaire and Rousseau had not written? Perhaps the saying of Fletcher of Saltoun is as near the truth on the subject as we are likely to get, even with all the aids of systematic philosophy. There are certainly remarkable instances on record, which it would be sheer perversity not to recognise, of the power of literature to inflame the minds of a people to great undertakings. Erasmus's *Praise of Folly*, and Luther's *Address to the German Nobility*, are as notable examples as can be cited of the truth of what has been said—that words have on occasion a force and reality beyond that of action. But besides this revolutionary

literature, there is another class of books which do not appeal to the passions of men, but which lay deep the foundations on which the society of the future must rest. The influence of such books cannot by their very nature be immediate; often, indeed, the generation among whom they have been produced is hardly aware of their existence. Spinoza is a curious example of a great thinker hardly known to his own contemporaries, but who has since so powerfully influenced the speculation of philosophers and the imaginations of poets. To the vital force of such books we need seek for no higher tribute than that paid to Adam Smith by Pitt, and lately emphasised by a great statesman of our own day.

It is apt to be forgotten that the broad distinction we usually make between men of thought and men of action is really a comparatively modern notion. It is simply the complex conditions of modern civilisation that have thrust the distinction upon us. In the nature of things, the gifts that go to make the really great writer would in other circumstances make of him an energetic ruler or commander. If we go to societies simpler than our own, we see the two characters conjoined in the most natural manner. In ancient Greece, one of the greatest of her poets was first in fight, first in manly sports, and first in letters. The greatest of the Greek historians was a military commander and a statesman; and it was said of Julius Cæsar that he wrote as well as he fought. It is worthy of note, also, that in the sixteenth century, during the Revival of Learning, and before the modern division of labour in intellectual things had taken place, the majority of the most eminent writers were likewise illustrious men of affairs.

It was the opinion of Locke and Dr Johnson that genius consists in great general powers accidentally determined to some special line of activity. The definition is, of course, utterly unsatisfactory, since it leaves unexplained the very point that calls for explanation—what it is in the man of genius that responds to the determining circumstances. Yet it must be regarded as a singular comment on this opinion that Wordsworth, the most consciously self-dedicated of poets, was firmly convinced that he had by nature the temper and aptitudes of a soldier. According to Lord Macaulay, Byron during his short career in Greece evinced all the qualities of a successful commander and administrator. It is surely, also, no fanciful supposition to think of Carlyle fulfilling the function of his countryman Knox in the sixteenth century. It will be remembered that a similar thing has been said of Scott himself—that, had he so chosen, his general force of mind and balance of character must have made him eminent in his original profession. All this is certainly far from making good the opinion of Johnson and Locke. Because Byron might have made a brilliant soldier and Scott a weighty lawyer, it does not follow that every great soldier and lawyer might be a poet like Byron or a

novelist like Scott. What it proves is only that literary genius of a high order is supported by qualities of mind and soul that ensure an extraordinary career in practical life.

THIS MORTAL COIL.

CHAPTER XLV.—PACTOLUS INDEED!

AFTER a sumptuous lunch, Hugh and the Russian returned to the rooms. To the rooms!—say rather to the treasure-house of Croesus! On the steps, they passed a young English lad, who looked barely twenty. 'Don't tell mamma I played,' he was saying to a companion ruefully as they passed him. 'She'd break her heart over it, if she ever knew it.' But Hugh had no time to notice in passing the pathos of the remark. Who could bother his head about trifles like that, forsooth, when he's coining his hundreds on the turn of a roulette table?

He meant to win hundreds—thousands—now. He meant to build up a colossal fortune—for Elsie, for Elsie.

These years had taught him a certain sort of selfish selfishness. It was no longer for his own use that he wanted money; he longed to lay it all down at Elsie's feet. She was his Queen: he would do her homage.

The tables had filled up three files deep with players by this time. Hugh had hard work to edge his way dexterously in between them: the Russian followed with equal difficulty. But a croupier, recognising them, motioned both with a courteous wave of his hand to two vacant chairs he had kept on purpose. Men who win—or lose—large sums command respect instinctively at Monte Carlo. Hugh and the Russian had each qualified, on one or other of these opposite grounds, for a seat at the table. Hugh's turn by the system, however, had not yet come on: he had to wait, according to his self-imposed law, till one of the four middle numbers should happen to turn up before he again began staking. So he gazed around with placid interest for some minutes at his crowded fellow-players. Success excites some nervous heads; it always made Hugh Massinger placid. There they sat and stood, not less, he thought, than five hundred busy men and women, fifty or sixty jostling one another round each separate board, playing away as if for dear life, and risking fortunes giddily on the jump of a pea in that meaningless little whirligig of a spinning roulette wheel. She was a German, he conjectured, that flat-faced impassive lady opposite, gambling cautiously but very high, and laden on her neck and arms with an atrocious dead-weight of vulgarly expensive jewelry. Then the bold but handsome young girl at her side, with the exquisite bonnet and well-cut mantle, and the remarkably full-blown Pennsylvanian twang, must surely by her voice be an American citizen. By her voice and by her play; for she risked her broad gold hundred-franc pieces with true-born American recklessness of consequence. And there, a little way off, stands a newly married English-

man, with his pretty small bride nestling close up to him in wifely expostulation. Hugh could even catch snatches of their whispered colloquy: 'Don't, George, don't.'—'Just this once, Nellie: a napoleon on red.'—Black wins: he loses.—'H'm, the chances there are only even. If I win next time, I get nothing but my own old napoleon back again. I'll go it one better now: a nap on a column. Then if I win, you see, I get four times my stake, Nellie.'—Lost again! How fast they rake it in!—'Well, then, I'll back a number this time.'—'Oh, but, George dear, you know you really can't afford it.'—George, unabashed by her wifely reproof, plumps down his napoleon on 32. Whir goes the roulette.—'Dix-huit,' cries the croupier, and sweeps in the gold with a careless curve of his greedy hand-rake. Poor souls! In his heart, Hugh Massinger was genuinely sorry for them. If only they had known his infallible system!

But even as he thought it, he roused himself with a start. Eighteen was one of the very numbers he had just been waiting for. No time for otiose reflections now; no time for foolish waste of sympathy: the moment had arrived for vigorous action. With a sharp decisive air, he plunged down a hundred louis on white. Bystanders stared and whispered and nudged one another. White won, and he took up his winnings with the utmost complacency. How quickly one accustoms one's self to these big figures! A hundred louis seemed nothing now, in pursuance of the system. Then he glanced across at George, poor luckless George, with a mute inquiry. How that smooth-faced young Englishman envied him his success; for George, poor George, had lost again. 'Madame,' Hugh said, addressing himself with an apologetic smile to the pretty young wife, 'allow me to venture ten louis for you.'—The blushing girl shrank back timidly. Hugh laid down ten pieces of gold on a number again, backing his own luck separately by the regular rule on a column of figures. Chance seemed to favour him: he was 'in the vein,' as gamblers say in their hateful dialect. The number won for poor shrinking little Mrs Nellie, and the column also won as well for Hugh himself. He pulled in his own pile of gold carelessly, and handed the other to the pretty young Englishwoman. 'It isn't ours,' she murmured with a shy look. 'You mustn't ask me; I really couldn't take it.'

Hugh laughed, and pressed it on the anxious husband, who cast a sidelong glance at the heap of gold, and finally in some vague half-hearted way decided upon accepting it. 'Now go,' Hugh said with a fatherly air. 'You don't understand this sort of thing, you know. You belong to the class predestined to be cheated. The sooner you leave this place the better. Let nothing induce you ever to risk another penny as long as you live at these precious tables.' We can all be so wise and prudent for others.

'But it's really yours,' the young Englishman went on, glancing down at it sheepishly. 'You risked your own money, you see, to win it.'

'Not at all,' Hugh answered with his pleasantest smile; he knew how to do a gracious act graciously. 'I've taken back my own ten louis out of it for myself. The rest is your wife's. I staked it in her name. It was her good luck alone that won for both of us. If you compel me

to keep it, you spoil my break. A burst of fortune must end somewhere. Don't stand in my way, please, for such a mere trifle.'

The Englishman's hand closed, half reluctantly, over the ill-gotten money, and Hugh, undisturbed, turned back again with a nod to his own gambling. The episode warmed him up to his work. A pleasant sense of a generous action prettily performed inspired and invigorated his play from that moment. He went on with his game with an approving conscience. Some people's consciences approve so blandly. The other players, too, observed and applauded. Gamblers overflow with petty superstitions. One of their profoundest is the rooted belief that meanness and generosity bring each its due reward: whoever gambles in a lavish free-hearted open-handed way is sure, they think, to become the favourite of fortune.

The Russian, on the other hand, kept on losing steadily. Now and again, indeed, he won for a while on some great *coup*, raking in his fifty or a hundred louis; but that was by exception: for the most part, he frittered away his winnings time after time, and had recourse with alarming frequency of iteration to his bundle of notes, from which he changed a thousand francs every half-hour or so with persistent ill-fortune. Turn upon turn, he saw his money ruthlessly swept in by the relentless bank with unvarying regularity. Now it was zero that turned up, to confound his reckoning, and the croupier with his bow made a clean sweep, offhand, of the entire table: now it was a long succession of left-hand numbers that won with a rush, while he had staked his gold with unvarying mishap upon the right-hand column. It was agonising each time to him to see the bank carelessly ladling out large sums to Hugh, while he himself went on losing and losing. But at all hazards, he would follow his calculations to the bitter end. Luck must have a turn somewhere; and at anyrate, plunging would never improve matters. Hugh pitied him from his heart, poor ignorant devil. Why couldn't he find out with an exercise of reason that obvious flaw in his own system?

A thousand francs on seven! The table stares, gapes, and whispers. Heavy for a number! Who puts it on? This Monsieur on the seat here—pointing to Hugh. The croupier shrugs his shoulder and spins. Out jumps the pea. Fourteen wins.—Monsieur was very nearly right again, *voyez-vous?*—Fourteen, my friend, is just the precise double of seven. Monsieur's luck is something truly miraculous.—He goes a thousand francs once more, still on seven. *Ciel!* but he has the courage of his convictions, *mon ami!* Twenty-three wins.—Wrong again! He drops on that a second thousand. But with what grace! A thousand francs is nothing to these milords. Hugh smiles imperturbably and stakes a third. On seven again! The man is wonderful. What wins this time?—'Sept gagne,' cries everybody in hushed admiration; and Hugh, more sphinx-like in his smile than ever, but conscious of a dozen admiring eyes fixed full upon him, takes coolly up his thirty-five thousand. Thirty-five thousand francs is not to be sneezed at. Fourteen hundred pounds sterling! The biggest haul yet, but nothing when you're accustomed to it. What a run of luck! Monsieur was in the vein indeed. He played on and on, more

elated than ever. At this rate, he would soon earn a fortune for Elsie.

Elsie, Elsie, Elsie, Elsie! Through the din and noise of that crowded gambling-hell, one sacred name still rang distinct and clear in his ears. It was all for Elsie, for Elsie, for Elsie! He must make himself rich, to marry Elsie.

He played on still with careless eagerness till the tables closed—played with a continuous run of luck, often varying, of course—for who minds a few hundreds to the bad now and then when he's winning one time with another his thousands?—but on the whole a run of luck persistently favourable. Raffalevsky, meanwhile, had played and lost. At the end of the day, as the lackeys came in to bow the world out with polite smiles, they both rose and left the rooms together. Then a sudden thought flashed across his soul. Too late to return to San Remo now! Awkward as it was, he must stop the night out at Monte Carlo. Full of himself—of play and of Elsie—he had actually forgotten all about Winifred!

They walked across side by side to the *Hotel de Paris*. Hugh was far too feverishly excited now with his day's play to care in the least about the slight and the insult to that poor dead girl. The mere indecency of it was all that he minded. A cynical hardness possessed him at last. Nobody need know. He strolled to the telegraph office and boldly sent off a message to the *pension*:

'Detained at Mentone with sympathising friends. Return to-morrow. Make all arrangements on my account.—MASSINGER.'

Then he presented himself at the bureau of the *Hotel de Paris*. Monsieur had no luggage; but no matter for that: the hotel made haste to accommodate him at once with the best of rooms, not even requiring a deposit beforehand. All Monte Carlo knew well, indeed, that Monsieur had been winning. His name and fame had been noised abroad by many-headed trumpeters. His pockets were literally stuffed with gold. He was the hero of the day. He had carried everything at the Casino before him. Attentive servants awaited his merest beck or nod; everybody was pleased; the world smiled on him. Alphonse, Marie, look well after Monsieur! Monsieur has had the very best of fortune.

He supped with Raffalevsky in a beautifully decorated *salle-à-manger*. They recounted to one another, gleefully, gloomily, their winnings and losses. The totals were heavy. They totted them up with varying emotions. Hugh had won three thousand four hundred pounds. Raffalevsky had made a hole in his larger capital to the tune of something like two thousand seven hundred. At the announcement, Hugh smiled his most benevolent and philosophical smile. 'After all,' he said, as he scanned the wine-card, toothpick in hand, in search of a perfectly sound Burgundy, 'if one man wins, another *must* lose. You have there the initial weak point of gambling. It's at bottom a truly anti-social amusement. But these things equalise themselves in the longrun; they equalise themselves by the doctrine of averages. Taken collectively, we're better off than we were at lunch at anyrate. Then, his Serenity of Monaco had pocketed a couple of hundred louis out of the pair of us, viewed in the lump. This evening, on the contrary, we're seven hun-

ded pounds to the good, as a firm, against him.—I like to beat these hereditary plunderers. It's a comfort to think that, in spite of everything we're more than even with him on the day's transactions !'

ODDITIES IN ITALY.

THE American tourist was not far wrong, perhaps, who described Italy as 'a one-horse place anyhow.' Absurdities are certainly to be noticed there which are met with nowhere else. To begin with, Italy is a land of beggars, and a more barefaced, shameless set of swindlers do not exist the wide world over. In Italy, every one who is too lazy to work for a living begs for one. The young and the old, the cripple and the strong, the ragged and the well dressed, all are at it from morning till night. In the streets, your path is blocked by mendicants; in the shops, your sleeve is plucked by them; in church, they kneel beside you. If your carriage stops a moment, a score of dirty hands appear before the windows. The nuisance is everlasting and indescribable. The blessings which an Italian beggar showers upon his benefactors are only equalled by the curses he heaps upon the stony-hearted who refuse him aid. At every corner, in every town, a beggar can be found at every hour of the day. The really cripple are drawn to their places in handcarts in the morning, and called for and taken away by their friends at dark. If time hangs heavy on their hands, they smoke their cigars in luxury, literally sitting still, while wealth rains into their laps. For persistent attack, unblushing effrontery, and resolute mien, the American book-agent fades into insignificance beside the humblest of Italian beggars.

The Italian is either very musical or very discordant. The real musicians delight in wandering about the streets under the starlit sky thrumming guitars or mandolins and making night musical; but the discordant ones pass your windows yelling their songs with such utter disregard to time and tune as to be perfectly sickening. The police take no notice of these midnight disturbances, which would certainly not be tolerated in any other civilised land.

In the shops, fixed prices are unheard of. The Italian shopkeeper starts in to make as much as possible out of his customer, and invariably demands for the article he is selling three or four times its value and what he expects to receive. The customer, on the other hand, listens to the price asked, and offers just one-fourth of it. Then comes a gradual meeting half-way, attended with piteous cries on the part of the seller, countless gesticulations, and assurances that he is being robbed, but is compelled to sell owing to the dullness of trade. A scene such as the following can be witnessed any day in Italy :

Tourist to Shopkeeper. How much are these gloves ?

Shopkeeper. Ten francs, honoured sir.

T. I will give you four francs for them.

S. The illustrious stranger is fond of joking !

T. Come along now—four francs or nothing.

S. Sir, it is impossible. Think of my starving family; have pity on—

T. That'll do, that'll do. (*Exit.*)

Half an hour later, the tourist passes the same

shop, when out runs the proprietor with a neatly folded parcel in his hand. 'Gentle sir,' says he, 'here are your gloves. I would rather accept four francs than offend you.—Is there anything else your honour requires to-day ?'

The workman in Italy performs his tasks at the same rate at which the average cabman drives when engaged by the hour. Everything he does is done slowly and lazily, with frequent pauses for rest, and numerous intervals for smoking and gossip. An English foreman would go mad in a day if compelled to superintend the labours of a squad of these slow-going, jabbering, gesticulating idlers. There is a story told illustrative of their proverbial sloth to the effect that the Italians once determined to build the largest ship that ever floated. For years the work went slowly on, and at last it neared completion; but alas, when the last half of the vessel was finished, the first half was found to be unseaworthy and rotten from old age.

In the public offices, one meets with vexatious delays, and absurdly little red-tape rules that are in the highest degree exasperating. It will hardly be credited that the delivery of letters to the householder is left entirely to the discretion of the letter-carriers. If the weather is fine and the postman has no more pressing engagement, the mail has a fair chance of being promptly delivered; but a shower of rain or an unusually good opera shuts off the chance completely. Registered letters sent to England must be sealed with wax, whilst letters to America must have none. A letter tendered for registration which is enclosed in a mourning or black-bordered envelope is refused, although no reason for this is ever vouchsafed or given. The money-order office—there is but one in every city—contains but a single clerk. This unfortunate wretch is supposed to be kept writing like lightning from early morn till dewy eve. When wearied, he pauses to roll and light a cigarette, or yawn and stretch himself—sometimes varying the performance by indulging in a friendly chat with a fellow-labourer in an adjoining department. Meantime the weary public waits patiently, nor ever dreams of agitating for a speedier and better organised system. It is by no means an unusual thing to wait three or four hours in the post-office for the issue of a money order, whilst an hour's delay is so common as to be unworthy of a moment's notice.

In the telegraph offices the same delays exist; and it is only necessary to mention concerning them, that the scoring out of a word, the addition of a sentence, or the alteration of a single letter, necessitates the rewriting of the entire message. Truly, time is not money in sunny Italy !

In Italy the churches are always open; prayers are for ever being chanted, confessions for ever being heard, and the incense-swingers never pause in their labours. All seats are free, and lord and beggar worship side by side. The weary tramp, the busy housewife, the successful merchant, all drop in to rest a while and to set apart a moment from the cares and duties of the day. The baptisteries adjoin the churches, and, like them, are always open. A priest, also, is always in readiness to perform the rite if desired.

The gesticulations of the Italians are simply wonderful. The shrugging of shoulders, tearing of hair, and waving of arms which goes on every-

where is a source of never-ending amusement to the traveller. Another sight which excites his derision is that of grown-up men kissing one another, which they often do most affectionately when they meet.

The Italian sportsman would, anywhere but in his own country, be held in contempt. He is *par excellence* a pot-hunter, and no quarry is too small, no game too insignificant for him. He is gorgeous in appearance with his retinue of dogs, his huge top-boots and spaciouly pocketed coat, his cartridge belts, winding-horn, and feathered cap; but his shots are all 'sitting' ones; and he will stalk a little thrush or linnet all day, and feel proud and content if he brings it home as the solitary result of his day's outing. There are no songbirds in Italy, for the simple reason that they are all shot at sight by the hordes of would-be sportsmen, who massacre them by the thousand. It is a sorry sight to see the market stalls piled high with feathered songsters, while woods and fields lie silent and unmusical. Many of the small birds are snared by the peasants for market purposes after a decidedly novel fashion. A spot being selected for the day's operations, a few cages containing some loud singing birds are hung in the neighbouring trees or thickets to allure their wilder brethren; a perch is then driven into the open ground, upon which is fastened a tame owl. This unfortunate bird, dazzled by the sunlight, and unable to fly or move away, bobs lazily up and down, cogitating no doubt as to how he may best escape from bondage. His ludicrous movements, odd as it may seem, attract the birds from all sides, which fly round him and perch upon the trees. Alas for their confiding innocence; the branches and boughs have all been smeared with the strongest birdlime; once they alight, escape is impossible. When evening comes, they are torn away by cruel hands, their necks are quickly wrung, and the owl is rewarded with a lump of raw meat and put away until the slaughter of the innocents is commenced again.

The Italian cab-drivers as a rule have the neatest of cabs and the fastest of horses. Some of them have certainly prehistoric vehicles and antediluvian quadrupeds; but the light *carozella*, drawn by the fast-trotting Sardinian pony, affords a means of locomotion unexcelled anywhere. The drivers are exorbitant in their demands to tourists and foreigners; but, on the other hand, will, if pressed, make a bargain which is but little in advance of the ordinary street-car fare, so that driving becomes a really inexpensive luxury. Carriages pass each other to the right instead of to the left, as in England, and it seems to be the rule that vehicles shall have the right of way over all pedestrians. It is no uncommon thing to see three or four carriages with horses at full gallop in the midst of the most crowded thoroughfare; and the idea of pulling up at a crossing, slowing at a corner, or waiting for a foot-passenger to pass, is a thing unheard of.

The Italian police are divided into so many different bodies and attired in so many different uniforms as to bewilder the average tourist. They are armed with swords instead of batons; but in spite of their clanking sabres, magnificent cocked hats, and nodding plumes, they are on the whole an inferior lot of men. Judging from the rate of pay they receive, this is not to be wondered at,

the marvel being that recruits for such a poorly remunerated service are ever found at all.

The trains in Italy are started by the sound of trumpet instead of by whistle, and the switch and flag men are—to use an Irishism—generally women.

In Italy, the men seldom or never shave themselves, and as a consequence barbers' shops abound. But one misses the luxurious ease of the transatlantic barbers' chairs, and groans escape involuntarily from the victim who finds himself wedged in the narrowest of seats, whilst a chattering apprentice experiments upon his chin. There is no fixed price for haircutting or shaving, the amount to be paid being left to the discretion of the customer. This is decidedly inconvenient, and leaves the stranger in awkward doubt, by which naturally the barber profits. It is only just to add, however, that a single copper will be accepted with as much dignity and as many thanks as would the largest fee.

Italy is the land of high taxation; everything is taxed, and the country is groaning under the awful load. Custom-house officers swarm in myriads over the land, and are so closely stationed to one another that it is a common thing for a traveller to have his luggage opened and searched half-a-dozen times in the course of a hundred yards. It will hardly be credited that a pound of cake, an egg, or a fowl bought in Pisa will be seized and confiscated at the Leghorn gates, only fifteen miles away, unless duty is paid on it.

In many of the streets of the larger Italian cities are to be found dinner stalls where for a sou a plate of temptingly cooked fish or dish of macaroni may be bought. The beautiful cooking, the freshness of the viands, the snowy whiteness of the tablecloth, and the good-natured gossip or banter of the stall-keeper, make the repast a most delicious one; and beside it, the ordinary English coffee-house meal, and the disgustingly dirty penny dinner of the New York coffee-stalls, are nowhere.

The opera in Italy is of course a national institution. The theatres are very large, the seats wide and roomy, and the ventilation almost perfect. Smoking is allowed in all parts of the house, and the rule is freely taken advantage of. The musical taste of the audience is evinced by the soft humming and beating of time which one sees and hears on all sides. The chorus of a popular song is not unfrequently joined in by the spectators; and a singer ending an air, or taking an unusually high note, is never allowed to finish it, for fear of failure, the effort being invariably drowned in vociferous applause.

The Italian soldiers, with the exception of the grenadier regiments, are decidedly undersized; but they are neatly uniformed, and but for the system of recruiting by conscription, would be popular. The officers, unlike our British warriors, are compelled to wear their uniform continually. Whilst on duty, a broad blue sash is worn diagonally across the tunic; but on no occasion and under no pretext may the uniform be laid aside or exchanged for mufti. Generals alone are exempt from this regulation, but even they must report the when and wherefore of donning their civilian attire. No officer is allowed to marry unless he can deposit one thousand pounds sterling with the War Office. This sum is at the husband's death

returned to the widow, and is supposed to keep her from the necessity of applying to the country for a pension. As the sum is a large one, and but few of the officers can afford its outlay, there are more bachelors than Benedicts amongst them.

The Italian boatman stands with his back towards you, and rows in this position by pushing the oars forward instead of pulling them backward. The boats, even when built for pleasure, are heavy and unwieldy things, and the oars so thick and stiff as to be well-nigh unmanageable.

Italian sweethearts are at marriage tied in a double knot, for, not content with the church ceremony performed by the priest, the law compels them to be also married by the mayor at the council chamber. Instead of wedding-cake, sweetmeats are provided, and distributed with lavish hands.

The death-bed in Italy is never the scene of tender parting or affectionate farewell. Whether on account of custom or emotion, it is hard to say, but the Italians declare they cannot bear to watch the last struggles of dying relatives, and so they leave the room in charge of strangers and nurses, and only return when the weary eyes have closed for ever and the struggling limbs are at rest.

No ladies ever dream of marketing in Italy; this duty is relegated entirely to the cook. To ask the price of a pound of butter or buy a melon in the market is unladylike and vulgar; and the mistress, if her dinner be not to the liking of her lord, can only wring her hands and bemoan the stupidity of her witless cook.

When day is over and the night draws down, the Italian seeks a café, where he may sip his cup of coffee or eat his ice and smoke his cigar in peace and comfort. Here, in the open air, listening to the band or strumming his own guitar, he spends an evening of delightful pleasure. He has endured the burning noontide, why grudge him the evening rest? He takes life easily, and as he goes, smokes and eats and sings his songs. The cafés are invariably filled, and the waiters are kept busy. The customary gratuity of a half-penny, which would make an English waiter burst with indignation, is received with murmured blessings and profound obeisances.

Italian landlords must imagine that the dwellers outside their classic shores have small faces, or never wash at all, for the jugs and basins provided in their rooms are truly lilliputian. On paying his bill, the traveller always finds that the soap has been charged for, as if it was an unusual luxury.

Besides being natural musicians, the Italians are natural gamblers. The national game of Lotto, now under the patronage and control of the government, is patronised to an incredible extent. The chances of winning are less than few and far between; but rich and poor, priest and peasant, patronise it with persistent regularity. The poor actually go without food and pawn the very beds they lie on in order to buy their weekly tickets. The game itself is of simple form: numbers from one to ninety inclusive are placed in a large revolving wheel, and at noon on Saturday, in the presence of the municipal officers and government representatives, five numbers are drawn forth by five different children gathered at random from the waiting crowd. These numbers are then

publicly proclaimed as the winning numbers for the week, and telegraphed far and near. Previous to the Saturday drawing—that is to say from Sunday morning till Friday night—tickets are sold. The purchaser chooses his own numbers, and he may buy two or three or four or five just as he pleases. It is needless to say that to choose five winning numbers is akin to a miracle. Two numbers not unfrequently come out, and occasionally a lucky investor hits on three; but these are rare exceptions, and, as at Monaco and other public tables, the percentage is so heavily in favour of the bank that the people lose their money with delicious regularity. To prevent cheating and possible collusion, the offices are closed for the sale of tickets on Friday night, and remain unopened till the day after the drawing takes place. The prizes vary in value in proportion to the amount paid for the ticket, and are tempting enough to keep the poor still poorer, while the government coffers grow full and overflow.

The Italian lover has always an eye to the main chance. Before venturing upon any marriage proposal, the lover makes it his business to find out what dowry is likely to be settled on the bride, and should it not come up to his expectations, at once transfers his affections elsewhere. The question of dowry is discussed, and the amount bargained for, much in the same way as the shopkeepers haggle over their wares; and the unfortunate girl who has no money in her own right, or upon whom her parents can afford to make no settlement, stands but a sorry chance of securing a husband, and accepts the inevitable with a calmness worthy of a better cause.

The bride in Italy is always supposed to furnish all the household linen for her establishment; not to be able to do so is a matter of disgrace. The number of articles included in her trousseau is enormous, and each one must be numbered by dozens. This is an excellent rule as far as the husband is concerned, for it frees him from any anxiety for years to come on account of the state of his wife's wardrobe; but, on the other hand, the poor are often unable to scrape together the clothes which the unwritten rule of society demands from them, and in many cases marriages are postponed from year to year until the requisite amount is provided.

This article has grown apace, or allusion might be made to other oddities still. Let what has been written therefore suffice. To the truth of the foregoing remarks many who read them will doubtless be able to testify.

BOLSOVER BROTHERS.

IN FOUR CHAPTERS.

CHAPTER II.

LABURNUM COTTAGE was a small but genteel domicile standing in its own plot of garden ground, in rather a lonely part of the suburbs of Medbury Royal. About two months previously to Walter's visit, it had been taken, furnished, by a certain Mr Evan Bolsover, a man about forty years old, and presumably a bachelor. Like so many of the male inhabitants of Medbury, Mr Bolsover went to London by train every morning and returned every evening. A few times, however, business had detained him in town all night,

on which occasions he had not failed to give Mrs Mims, his housekeeper, notice beforehand of his intention.

Mr Bolsover seemed to have no friends, or acquaintances even, in Medbury, neither did any one seem to be aware of the nature of the business which took him daily to the City. Two or three times he had brought a friend home with him—it was always the same person—who stayed all night and went away with him after breakfast next morning.

The only other inmate of the Cottage was Mrs Mims, the housekeeper, who was the person chosen by Mr Bolsover out of a score of other applicants for the post in response to his advertisement in the *Medbury Weekly News*. It was a wonder to many people why 'Mother Mims,' as she was called, should have been selected out of so many apparently far more eligible candidates. To begin with, she was short-sighted and partially deaf; all her movements were slow and mechanical, and any orders or instructions which might be given her, beyond those of the simplest kind, had usually to be impressed upon her a second time before she seemed to thoroughly comprehend them. She had large, vacant, fishy-looking eyes; and her face was generally as devoid of feeling or expression as the figure-head of some storm-battered Indianan. On the other hand, the woman was warranted as being clean, honest, and thoroughly trustworthy; and it may be assumed that in choosing her for his housekeeper Mr Bolsover knew quite well what he was about.

Dr Lindley called at the Cottage in due course, and was admitted by Mrs Mims, who ushered him up-stairs, where he found Mr Bolsover in dressing-gown and slippers, seated in an easy-chair before the bedroom fire. As soon as Mrs Mims had shut the door behind the young doctor, the two men stared for a few moments in silence, as if mentally taking stock of each other. Then Mr Bolsover said with a little laugh: 'Good-morning, doctor. Sorry to have had to send for you. Hope we shall become better acquainted by-and-by.'

He had a low square forehead, rather high cheek-bones, and an aquiline nose. A long black silky beard and moustache hid the lower part of his face. His eyes were clear and resolute-looking; and Lindley had not been two minutes in his company before the conviction grew upon him that he was in the presence of a man of more than ordinary force of character.

Dr Lindley was down-stairs again about ten minutes later. He found Mrs Mims, broom in hand, sweeping the lower passages. 'Your master's cold is a very bad one,' he said, speaking a little above his ordinary tone. 'I will send him a bottle of medicine in the course of an hour, and will call again in the morning. Meanwhile, you had better lay in a little arrowroot and black currant jelly, if you haven't any in the house; and be careful that the fire in his room is not allowed to get too low.' Mrs Mims blinked her fishy eyes and nodded and gasped: 'Yes, sir—just so, sir. I'll not forget, sir.'

Next morning Mr Bolsover was worse, and was ordered to keep his bed till further orders. 'I'm afraid the cold has settled on his chest and that he won't be able to leave the house

for some days,' explained Dr Lindley condescendingly to Mrs Mims, who expressed herself as being deeply concerned at the news.

When he reached Laburnum Cottage the following day, Mrs Mims said to him in a low voice as she admitted him: 'There's a gentleman up-stairs with master. He kem about half a hour ago. He's been here two or three times afore, and stayed all night.'

The young doctor's shoes took a deal of wiping on the mat this morning. 'You needn't trouble to show me up,' he said to the housekeeper; 'I know the way by this time.'

On opening the bedroom door he found, as he had quite expected to do, that the visitor was none other than Mr Gazebrooke.

When Dr Lindley came down-stairs, he looked very grave indeed. 'I am sorry to say'—speaking into the housekeeper's ear—'that there is a great change for the worse in your master's condition. It is highly necessary that he should have a trained nurse to attend to him, and I am now going to telegraph for one to one of the London hospitals. No doubt she will arrive in the course of the day, and it is Mr Bolsover's wish that the spare back-room should at once be got ready for her.'

It took the housekeeper's slow-working wits a minute or two to assimilate such a mass of information, conveyed to her in a breath, as it were. Then she flung up her hands, and her watery eyes looked more watery than ever. 'Heart alive! and is the poor dear gentleman as bad as that?' she exclaimed. 'And a nurse from London, too! Well, well. I'll have everything in apple-pie order for her, sir, never fear.'

Although Walter Lindley unaccountably neglected to telegraph for the nurse, as he had told Mrs Mims he would do, that person duly arrived at Laburnum Cottage about six o'clock the same evening, and after partaking of a cup of tea, at once proceeded to take up her new duties in the orderly methodical manner peculiar to her class. Mr Gazebrooke had taken his departure some hours earlier.

Doctor and nurse looked curiously at each other when they met for the first time next forenoon. The nurse was a rather good-looking woman of thirty or so, plainly attired after the fashion of her calling. She had a firm, rather hard-set mouth and steel-gray eyes, with a curiously watchful expression in them, like that of one who is constantly listening for a summons of some kind and knows not from moment to moment when it may come. Her manners were quiet and self-possessed, and from what little the doctor could judge, she seemed to be a person of some education. She was a good deal in the young man's thoughts both that day and for some days afterwards; but after all, as he said to himself, she was merely one more factor added to the mystery in which he himself was playing a part without any clue to the why or the wherefore of that which he was called upon to do.

Day by day Mr Bolsover's malady increased, and presently the doctor found it advisable to call at the Cottage both morning and evening. Nurse Goodson was indefatigable in her attention to her patient, and scarcely left his room by day or night. Occasionally, when he was asleep, she would ask Mrs Mims to relieve her for a

couple of hours while she took a little much-needed rest on the sofa in her own room.

On the afternoon of the eighth day from the beginning of his illness Mr Bolsover died. Mr Gazebrooke and the nurse were with him at the time. The doctor had seen him two hours previously, and although he had whispered his fears to Mrs Mims on leaving, he did not seem to have anticipated that the end was so close at hand. The housekeeper was sent in hot haste to fetch him the moment it was seen that a sudden change for the worse had set in; but by the time he reached the Cottage all was over.

A little later, the doctor having gone by that time, Mr Gazebrooke sent for Mrs Mims and gave her a list of some trifling purchases he wished to have made in the town. He also made her a present of a sovereign with which to buy a mourning dress for herself. The housekeeper set out at once, and was away about an hour. When she got back, Mr Gazebrooke was gone. She and the nurse partook of supper together, soon after which they separated for the night.

While they were at breakfast next morning Nurse Goodson said: 'I expect Mr Bolsover's brother here in the course of the day. Mr Gazebrooke promised to telegraph for him last evening. As soon as he comes, I shall go about my business.'

'I should like to see him,' said the housekeeper a little later, with a significant nod of her head at the ceiling. 'Perhaps I mayn't have a chance after his brother comes. He was a kind master to me, and I should like to bid him good-bye for the last time—though of course, poor dear, he won't know nothing about it.'

'I'm sorry not to be able to gratify you,' answered the nurse; 'but Mr Gazebrooke took the key of the room with him last evening. He was to meet the other Mr Bolsover—Mr James, I think they call him—on his way through London this morning, and no doubt the latter will bring the key with him.'

If Mrs Mims' countenance had been able to express disappointment, she would doubtless have expressed it; as it was, she merely blinked her eyes and made an odd snuffling noise in her throat.

'Where be they going to bury him?' she presently asked.

'That is more than I can tell you. No doubt all the arrangements are left till Mr James's arrival.'

It was about two o'clock in the afternoon when Mr James Bolsover made his appearance at the Cottage. After a brief interview with the nurse, the latter at once took her departure.

There was a strong family likeness between the brothers; both were about the same height and the same build, but Mr James looked considerably the elder of the two, his hair being thickly sprinkled with gray; and whereas the dead man had worn a long beard and moustache, his brother was closely shaven except for two short side whiskers. Mr Evan Bolsover's accent had been that of a Londoner, or at least of a south-country man: Mr James spoke with a pronounced north-country burr.

At his request, Mrs Mims went out and bought a steak and cooked it for him, after which he busied himself about the house, up-stairs and

down, for a time, and seemed as if he were hunting for something he had a difficulty in finding.

'Mebbe it's the will he's trying to find,' muttered the housekeeper to herself. He found something else, however, that seemed to his taste, namely, a bottle of brandy in the sideboard. Having his cigar-case and a newspaper with him, he contrived to make himself tolerably comfortable till the shades of evening began to gather apace. Then Mrs Mims ventured to disturb him by taking a lighted lamp into the room.

'My good woman, you needn't have brought that thing,' he said a little testily. 'I shall be off back to London in the course of a quarter of an hour. I suppose there's some place in the town where you can sleep?'

'Sleep, sir!' gasped the startled housekeeper.

'I mean at some friend's or relation's house. Of course I couldn't think of leaving you all alone here for the night.'

'I shouldn't mind it, sir; I ain't a bit frightened of dead folk.'

'Anyhow, we won't put you to the test. No doubt you'll be able to get a bed somewhere, and you may as well set about it at once. But first fasten all the lower doors and windows, and bring me the key, or keys, if there are more than one, of the front door. If you get here by mid-day to-morrow it will be time enough.'

At the door Mrs Mims paused. 'Be the funeral to take place in Medbury, sir?' she ventured timidly to ask.

'O dear, no. We have a family grave in one of the London cemeteries, and my poor brother will be buried there. The undertakers will be here in the course of to-morrow evening with a shell and a hearse to remove the body.'

'I don't like him a bit,' Mrs Mims confided to herself as she was putting on her bonnet and shawl a few minutes later. 'He ain't got half such a nice way with him as the poor dear up-stairs had. To turn me out in this way! it's just shameful. And what does he mean with his talk about a shell?—I never heard tell of dead folk being put into shells; besides, where would he find one big enough?'

Mrs Mims' mind was a peculiar one, with queer crotchets in it, and out-of-the-way corners in which lurked many strange fancies and old-world notions. She was possessed by a strong desire to look once more on the face of her dead master and to bid him good-bye, as she termed it. He had been kind to her after a careless, easy-going fashion during the short time she had been in his service, and a little kindness went a long way with the housekeeper. It seemed to her that she would be wanting in respect to his memory if she were to let him pass out of her sight for ever as if he were no more than a clod or a stone. She had a sort of vague notion that so long as the dead man remained under the roof where he had died, he was somehow aware of all that was happening around him. More than once she had made up her mind to ask Mr James Bolsover for the requisite permission; but there was something in that hard, clear-cut, close-shaven face which caused the words to die away on her lips.

The front door of Laburnum Cottage was fitted with a Chubb's lock, to which there were two

keys, one of which had been held by Mr Bolsover, and the other by Mrs Mims. Both these keys the housekeeper now gave into the keeping of Mr James. As she made her way towards her daughter's house after leaving the Cottage, she came to a stand for a moment every now and again and chuckled vindictively to herself. 'Won't even trust me with the key, won't he? He's a fine one, if he thinks to keep me out by doing that!'

The fact was that Mrs Mims had a third key in her possession unknown to any one, which she had found one day amongst some rubbish left by the previous occupants of the Cottage. The tenants in question had comprised a widow lady and three grown-up sons, and each of the young men had doubtless possessed a latchkey of his own. The key thus found, Mrs Mims cleaned and put away in her own room, thinking that it might come in useful should either of the others get lost or mislaid. This evening, however, she took it away with her in her pocket.

METEORIC IRON.

THE fall of bodies from the sky has been recorded by the early writers of many nations, but a century ago the occurrence of such an event seemed so improbable, that scientific-men and the world in general did not believe in its possibility. In 1794, however, the German philosopher Chladni collected accounts of the fall of a large number of these meteoric bodies, and directed special attention to the existence of several masses of iron which appeared to him to be undoubtedly of extra-terrestrial origin. Some eight years afterwards a paper on the same subject was read before the Royal Society by E. Howard. This stirred up so much interest in the scientific world, that the French Minister of the Interior directed the Academician Biot to endeavour to settle the question of the existence of these bodies by a careful examination of a fall of stones which had been reported at l'Aigle, in the neighbourhood of Paris. These papers, and especially the exhaustive memoir of Biot, compelled the scientific world to recognise the fall of bodies upon the earth from extra-terrestrial regions as an undoubted fact.

We may conveniently divide meteorites into two classes—namely, those which consist almost entirely of iron, and are therefore termed aerolites or sky-irons; and those which are composed almost wholly of stone, and are called aerolites or sky-stones. A very useful and interesting collection of meteoric irons and meteoric stones is to be found in the Mineralogy department of the Natural History Museum, South Kensington.

The masses of meteoric iron which have actually been observed to fall are only seven in number, although more than one hundred pieces of metallic iron have been discovered in different parts of the globe, which are undoubtedly of meteoric origin. Chemical examination of these aerolites reveals the fact that they are composed chiefly of iron alloyed with nickel. More than twenty of the other elements which occur most frequently in the earth's crust have also been found in different masses of meteoric iron. The iron present usually varies from eighty to ninety-

five per cent., while the nickel ranges from six to ten. These meteoric masses generally possess the characteristic properties of bar-iron, and are therefore readily worked with the hammer; in fact, the ancients employed this iron, which they regarded as the gift of the gods, in the manufacture of their weapons of war. This custom still holds among certain semi-civilised tribes, such as the Eskimos and the inhabitants of Central Africa.

Aerolites are often of considerable size, and thus they present a remarkable contrast to the aerolites or sky-stones, which are never of very great weight. The largest meteoric stone known is that which fell at Knyahimja, in Hungary, on the 9th June 1866. It weighs six hundred and forty-seven pounds, and is preserved in the Vienna Museum. One of the masses of meteoric iron to which Chladni drew attention in 1794 is the now famous mass known as the Pallas iron, so named from the traveller Pallas, who discovered it in 1772 on the face of Mount Kemirs, situated between Krasnojarsk and Abekansk, in Siberia. This mass was of irregular form, and weighed sixteen hundred pounds. It possesses large pores, which are filled with a yellow-coloured olivine (a silicate of iron and magnesium, also known as 'chrysolite'); but the interior of the mass consists of iron which can be worked either cold or at a moderate heat. The iron brought from the Red River, in Texas, and known as Gibb's meteorite, is about equal in weight to the Pallas iron. It is three feet four inches in length, two feet four inches in breadth, and one foot four inches in height. The Tucson meteorite is ring-shaped, and measures forty-nine inches in its greatest diameter. It was found at Sonora, in Mexico, and weighed fourteen hundred pounds. A far larger mass of iron was that which a band of roving Indians found in the Gran Chaco Gualamba, near Otumpa, in South America, and which they imagined to be an iron mine. So early as 1783 Don Rubin de Celi was sent to investigate the matter; and he reported that the district was uninhabitable from want of water, and that for many miles around he could discover neither iron mines, mountains, nor the smallest stones. He estimated the weight of the mass at thirty to thirty-two thousand pounds. Again, masses of meteoric iron have been found in the Bolson de Mapini, or Mexican Desert, situated in Cohahuila and Chihuahua, two of the northern provinces of the Mexican republic. Three masses were discovered here in 1854 (one of these was the Tucson iron described above); while fourteen years later eight more were taken to the United States; and in 1871, a large mass weighing seven thousand seven hundred pounds was found near El Para. Rumours, too, are not wanting of a still larger meteoric mass which may be seen in the centre of this lone and desolate region.

That these falls of aerolites are not confined to any particular quarter of the globe is seen by the instances already cited. In Australia, too, the great Cranbourne meteorite was discovered near Melbourne in 1861; while in our own island, a small mass was seen to fall at Rowton, near Wellington, in Shropshire, on the 20th of April 1876. The Rowton meteorite weighed seven and three-quarter pounds, and fell at forty minutes past three P.M. in the midst of a heavy shower of rain. A peculiar rumbling noise was said to have been

heard, followed almost immediately by an explosion somewhat like the discharge of heavy artillery. The iron penetrated to a depth of eighteen inches, and was quite warm when extracted, an hour after its fall. Except where it struck the ground, the whole surface of the meteorite, as is usually the case, is covered with a thin crust or varnish, caused by the fusion of a small portion of the mass by the heat generated during its rapid passage through the air.

As might be anticipated, it is not always easy to distinguish a mass of iron of meteoric from one of terrestrial origin. This is well shown by the controversy which has taken place as to the origin of the large masses of nickeliferous iron discovered in 1870 by Professor Nordenskiöld on the seashore at Ovik, Disko Island, in Western Greenland. One of these masses weighed fifty thousand pounds, while two others weighed twenty thousand and nine thousand pounds respectively. At one time it was held that the presence of nickel in these iron masses was a proof of their meteoric origin; but a careful examination of the rocks in the neighbourhood showed that the basalt contained nickeliferous iron disseminated through it, and that, therefore, these masses are probably of terrestrial origin, having been left exposed upon the beach by the weathering of the rock-matter which formerly enclosed them.

It is interesting to notice that meteorites contain a considerable volume of various gases condensed or confined within their mass. These gases consist of one or more of the following: carbonic acid, carbonic oxide, hydrogen, nitrogen, and marsh gas. When the meteoric mass is heated in a vacuum, these gases are evolved, and may be collected. On examination it is found that the volume of the gas evolved, as well as its percentage composition, varies much with the meteorite experimented with; thus, the Lenarto aerolite yielded Professor Graham nearly three times its volume of gas, containing eighty-six per cent. of hydrogen, ten of nitrogen, and four of carbonic acid; while the Arva iron contained no less than 47·13 times its own volume of gas, composed of sixty-eight per cent. of carbonic oxide, thirteen of carbonic acid, eighteen of hydrogen, and one of nitrogen. Meteoric stones generally contain all these gases, together with a small percentage of marsh gas or firedamp, a gas which is well known as the cause of the death-dealing explosions which occur in our coal-mines from time to time.

The theories which have been proposed to account for the existence and fall of these meteorites are extremely unsatisfactory. At one time it was suggested that they were ordinary stones which had been struck by lightning; that they had recently been ejected from terrestrial volcanoes; that they had been carried into the air by a whirlwind; or that they had been formed by the condensation of a cloud which had been carried from some distant volcano. All these theories are found to be untenable in the face of more recent observations. Laplace imagined that they might have their origin in *active* lunar volcanoes; but no active volcanoes are known to exist in that luminary. That they are projectiles from ancient lunar volcanoes seems equally hopeless; for if once the projectile failed to touch this

planet, its chance of doing so afterwards would be extremely small. In a contribution to *Nature*, Professor R. S. Ball has discussed the possibility of a volcanic origin for meteoric masses, and comes to the conclusion that if a volcanic origin were possible, he would be inclined, on mechanical grounds alone, to believe that they had been discharged in bygone ages from the volcanoes of our own planet. Having passed away from the attraction of the earth, they would take up a path around the sun, which at some time or other would intersect the orbit of the earth, and that then the projectile would reappear in the form of a meteorite.

Others have imagined that these masses have been produced by the collision of two planets, or the breaking up of a former satellite of the earth. This theory seems extremely improbable; for the initial velocity required to carry a body from one of the smaller planets to within the earth's orbit is very considerable, and the chances of its striking the earth are very small; besides, it would then be reasonable to expect the appearance upon the earth of larger meteoric masses than those with which we are at present acquainted. In addition to all this, the rapid and peculiar motion of these meteorites is inconsistent with the many and ingenious theories which would confine them to the solar system. For the present, therefore, the origin of these interesting bodies must be ascribed to that part of space which is termed 'interstellar,' and of which nothing is known.

MY UMBRELLA.

SOME years ago I happened to be at that most picturesque old city of Würzburg on a showery May market-day. The window of my hotel commanded the square. The moment that the first sprinkle came over the busy scene of market-women and chafferers, the whole square suddenly flowered like a vast garden. Every woman at her stall expanded an enormous umbrella, and these umbrellas were of every dye—crimson, blue, green, chocolate, and—yes, there was even one of marigold yellow, under which the huckstress crouched as beneath a mighty inverted escholia. Nor were these umbrellas all *selfs*, as horticulturists describe monotonous pansies; for some were surrounded with a perfect rainbow of coloured lines as a border; and others were wreathed about with a pattern of many-hued flowers. Presently, out came the May sun, and, *presto*, every umbrella was closed and folded and laid aside: the flower-garden had resolved itself into a swarm of busy marketers.

On reaching Innsbruck, I lighted on an umbrella-maker's shop under one of the arcades near the Golden Roof of Frederick with the Empty Pockets. I saw suspended, before the vault in which the man dwelt or did business, umbrellas the exact reproductions of what I had seen at Würzburg—red, green, brown, blue, white—lined with pink, like mushrooms: and for the sum of about fifteen shillings I became the happy possessor of one of these articles, which I proceed to describe. The covering was of a brilliant red, and imprinted round it was a wreath of flowers and foliage, white, yellow, blue, and green; around the ferrule also was a smaller wreath similar in colour and character. This cover was stretched on canes, such canes as are well known in schools;

and the canes were distended by twisted brass strainers, rising out of a sliding tube of elaborately hammered brass, through which passed the stick of the umbrella. The whole, when expanded, measured nearly five feet, and was not extraordinarily heavy, nothing like the weight of a gig-umbrella. Walking under it was like walking about in a tent, taking the tent with one; and walking under it in the rain filled one with sanguine hopes that the day was about to mend, so surrounded was one with a warm and cheerful glow. On a hot climb over a pass, when I spread this shelter above my head against the sun, I felt that I must appear to the shepherds on the high pastures like a migratory Alpine rose.

I met with no inconvenience whatever from my umbrella till I reached Heidelberg on my way home, and innocently walked with it under my arm in the Castle gardens on Sunday afternoon. Then I found that it provoked attention and excited astonishment. Such an umbrella had its social level, and that level was the market-place, not the Castle gardens; it was sufferable as spread over an old woman vending *sauerkraut*, but not as carried furling in the hand of a respectably dressed gentleman. So much comment did my umbrella occasion, as to annoy me, spoil the pleasure of my walk, and force me finally to thrust it up my back under my coat, and with crossed arms to the rear, hug it to my spine. But even so I was not able to escape observation, for the black handle, crooked, appeared below my coat, a fact to which I was aroused by the exclamations of a nursemaid: '*Ach Tausend!* the Herr has a curly tail!' and then of a Professor, who, beckoning some students to him, said: 'Let us catch him—the Missing Link, *homo caudatus*.'

On reaching England, the great scarlet-crimson (it was neither exactly one nor exactly the other) umbrella was consigned to the stand in the hall. Those were not the days when ladies spread red parasols above their bonnets, and had sun-shades to match their gowns: in those days all parasols were brown or black; consequently, the innovation of a red umbrella would be too great, too startling for me to attempt. But one morning—it was that on which the Duke and Duchess of Edinburgh made their entry into London after their marriage—I started early to drive to the station and go to town and join the sightseers. It may be in the recollection of those who were out that day that snow fell—in the morning early, in the country, there was a good deal of snow, so much, that I thought I might safely take my Tyrolese umbrella to cover me in my gig. I intended to furl it before I reached the station and such places where men do congregate. It was remarkable that just as the snow spoiled the picturesque effect of the procession in Regent's Street by making the redcoats draw on their overcoats, it induced me to unfurl my marvellous red travelling tent—which is only one more instance of the compensation there is in nature.

As I drove along, I chanced on an umbrella-maker trudging through the snow, head down, with a bundle of his manufacture under his arm. He neither saw nor heard the dogcart till it was close on him, when the driver shouted to him to stand aside. Then he started back, looked up; and I saw the change of expression in the man's face as his eyes took in the apparition above him

of the expanded red umbrella, flower-wreathed and brass-mounted. The face had been inanimate; a wild enthusiasm or astonishment kindled it, and down into the snow at his feet fell the umbrellas he was carrying. I drove on, but looked back at intervals, and as long as he was in sight, I saw him standing in the straight road, with eyes and mouth open, hands expanded and every finger distended, and his umbrellas uncollected scattered about him in the snow.

These reminiscences of my remarkable umbrella lead me to say something of umbrellas in general.

I hardly think that the true origin, development, and, shall I say, degradation of the umbrella, is generally known. Yet it deserves to be known, for it supplies a graphic and striking condensation of vast social changes.

The umbrella comes to us from the East, from nations living under a burning sun, to whom shade is therefore agreeable. We can understand how the giving of shade came easily to be regarded as a symbol of majesty. In the apocryphal book of Baruch occurs the passage, 'We shall live under the shadow of Nebucodonosor, king of Babylon, and under the shadow of Balthasar, his son.' Primitively, kings gave audience and delivered judgment seated under trees, not only because of the comfort of the shade, but also because of the symbolism. So, when Ethelbert, king of Kent, received St Augustine, it was seated under an oak; and Wagner is quite right when, in the opening scene in *Lohengrin*, he makes King Pepin hold his court enthroned under a tree.

But when sovereigns took to receiving suitors and dispensing justice indoors, they transferred with them to within the symbol of the tree. Phylarchus, in describing the luxury of Alexander, says that the Persian kings gave audience under plane-trees or vines made of gold and hung with emeralds, but that the magnificence of the throne of Alexander surpassed theirs. Curtius relates how the kings of India had golden vines erected so as to overspread their thrones, in their judgment halls. The throne of Cyrus was over-canopied by a golden vine of seven branches. Firdusi describes a similar throne-tree at the festival given by Kai Khosru:

A tree was erected, many-branched,
Bending over the throne with its head:
Of silver the trunk, but the branches of gold;
The buds and the blossoms were rubies;
The fruit was of sapphire and cornelian stone;
And the foliage all was of emerald.

From the East, the idea or fashion was transplanted to Byzantium, and the emperors had similar trees erected above and overshadowing their thrones. William of Rubruquis describes a great silver tree in the palace of the Khan of the Tartars, in 1253, of which leaves and fruit as well as branches were of silver. But kings went about, and wherever they went their majesty surrounded them; consequently, with the double motive of comfort and symbolism, the umbrella was invented as a portable canopy or tree over the head of the sovereign.

The Greeks noticed and disapproved of the use of the umbrella. Xenophon says that the Persians were so effeminate that they could not content themselves in summer with the shade afforded by trees and rocks, but that they employed portable contrivances for producing artificial shade. But

when he says this, he most certainly refers to the kings, for they alone had the right to use umbrellas. On Assyrian and Persepolitan reliefs we have a eunuch behind the sovereign holding an umbrella over him when walking, or when riding in his chariot, or when seated; on a bass-relief of Assur-bani-pal, however, the king is figured reclining under an overshadowing vine, which is probably artificial. Firdusi says of Minutscher: 'A silken umbrella afforded shade to his head.'

Indeed, the umbrella came to be as identified with royalty as the crown and the throne; and among the Buddhists it remained so. Four feet from the throne of the Great Mogul, as described by Tavernier, were two spread umbrellas of red velvet fringed with pearls, the sticks of which were wreathed with pearls. Du Halde says that in the imperial palace at Peking there were umbrellas always ready for the emperor; and when he rode out, a canopy was borne on two sticks over his head to shade him and his horse. Of Sultan Mohammed Aladdin we are told that he adopted insignia of majesty hitherto used in India and Persia and unknown in Islam; among these was a canopy or umbrella held over his head abroad. Of one Sultan's umbrella we are told that it was of yellow embroidered with gold and surmounted by a silver dove.

But as the umbrella was the symbol of majesty held over the king's head, it behoved the royal palace to imitate the same, and by its structure show to all that it was the seat of majesty. Thus came the cupola or dome into use, and what was given to the king's house was given also to the temples. In Perret and Chapui's conjectural reconstruction of the temple of Belus, near Babylon, above the seven stages of the mighty pyramid is the shrine of the god surmounted by a dome. In all likelihood this really was the apex of the pyramid; the dome was a structural umbrella held over the supreme god.

The great hall of audience of the Byzantine emperors was surmounted by a cupola. Two Councils of the Church, in 680 and 692, were held in it, and obtained their designation in *Trullo* from this fact. From the royal palace the cupola passed to the church, as the crown of the House of the King of kings; and a dome was erected over the church of the Holy Sepulchre by Constantine, and over the church of the Eternal Wisdom by Justinian. But it had already been employed as the crown of a temple, not only in the Pantheon at Rome, but in the Tholos, the temple of Marnas or Dagon at Gaza.

But the great dome or umbrella by no means excluded the lesser one beneath it, and kings' thrones under cupolas were also over-canopied by structures of wood or marble or metal. Such a *baldacchino* is seen over the sungod in a bass-relief at Sippar. It became common, and was sculptured, or when of textile work, was embroidered with leaf and flower work, retaining a reminiscence of the original tree beneath which the king sat and held court. It also passed to the church, and became a subsidiary umbrella over the altar. Paul the Silentary in the sixth century describes that in the church of St Sophia at Constantinople as a dome resting on four silver pillars. Constantine erected much the same sort of domed covering above the tomb of the apostles in Rome.

In the Catacombs the vaulted chapels and the overarched recessed tombs are all attributable to the same idea; nor has the original notion been lost in them, for they are frescoed over with vines, bays, and other foliage. The most beautiful instance is also the earliest, the square crypt in the cemetery of Prætextatus, which dates from the second century. Here the entire vault is covered with trailing tendrils and leaves with birds perched on them. A couple of centuries later, the original idea was gone, and we find, instead of a growing tree, only bunches and sprigs of flowers.

So!—the umbrellas that pass in the rain under the shadow of the mighty dome of St Paul's are its poor relations, and my flower-wreathed *parasol* preserves in its leafage a reminiscence of the original tree; and the old German woman sits and vends carrots under what was once the prerogative of the sovereign. Is it not a token that sovereignty has passed from the despot to the democracy?

SOME OLD BRITISH BALLADS.

II.—'THE FAMOUS FIGHT OF MALAGO.'

WE have dealt with the martial valour of landmen, and it is only fair that we should now give a specimen or two of the old ballads in which the deeds of our brave sea-lions are extolled. These sea-ballads seem to have been great favourites with the land-lubbers, for though a large number of them are printed, yet few specimens are now extant—which rarity goes far to prove their popularity. Perhaps the most singular feature of these black-letter ballads is their pictorial ornamentation. Most of them had at their head a square wood-engraving of more or less doubtful artistic merit. The heroes and heroines of pastoral or amorous ballads were depicted in all the bravery of huge ruffs, collars, fardingales, sombreros, swords, plumes, and all the rest of the theatrical wardrobe. The war-pieces are really surprising—those heading the ballads of *Oudenarde* and the *Courageous English Boys* are revelations in the way of drawing and workmanship. One thing is noticeable—the booksellers seemed to have but a poor idea of the fitness of things, for they constantly make use of old blocks, and often without the slightest reference to the matter of the ballad. We find chubby Cupids dodging behind pillars, bow in hand, with arrows drawn to the head, adorning war-songs; ships in distress over love-songs; and so on—all of which is ludicrous and out of place. The plan, laudable from an economic point of view, still seems rather like imposing upon the artists and the good-natured public.

When the black-letter went out of fashion—to the ruin of many respectable makers of spectacles—these curious engravings also became less frequently used. As for the wood-engraving which heads the ballad of *The Famous Fight at Malago*, it is curious, but still seemingly a serious attempt to illustrate the subject of the song. There are three vessels, or parts of vessels—as much of them as the artist could crowd into the limited space—great waves with crested tops, and one or two drowning men—real giants, judging from their proportions. This spirited ballad has the following long

sub-title: 'The Englishmen's Victory over the Spaniards: Relating how Five English Frigates—viz., the *Henry*, *Ruby*, *Antelope*, *Greyhound*, and *Bryan*, burnt all the Spanish Ships in their Harbour at Malago; battered down their churches and their houses about their ears, kill'd abundance of their Men, and obtained a Victory.' The motto is:

Where ever English seamen goes,
They are a terror to their foes.

The minstrel's welcome on this occasion seems to be rather more restricted than was generally his wont; he says:

Come all you brave sailors that sail on the main,
I'll tell you of a fight that was lately in Spain,
And of the sail of frigates bound to Malago,
For to fight the proud Spaniards, our orders was so.

Grammar was never a strong point with the ballad-mongers; but we need not stop to discuss this point. The rhyming historian tells us that the frigates were the *Henry*, and the *Ruby*, and the *Antelope* also; while the *Greyhound* and the *Bryan* as fireships must go; and so bravely did they play their parts, that they made the proud Spaniards quake in their hearts. They came to an anchor quite near the mole, being very bold; and they were so short a distance from the town that they battered much of it down:

They hung out their flag of truce for to know our intent,
And they sent out their long-boat to know what we meant.

But our captain he answered them bravely, it was so,
'For to burn all your shipping before we do go.'
'For to burn all our shipping you must us excuse,
'Tis not five sail of frigates shall make us to muse,
But we burnt all their shipping and their gallees also;
And we left in the city full many a widow.

The gallant captain directed the fire, and so brought down the church spire; then the belfry came down with a crash, although it was so high, and made many of the gentry to the monasteries to flee. And so great a confusion did their guns make in the town, that nearly all their tall buildings were knocked down; while the poor little children for help did cry, though nobody could relieve from the danger which was so nigh. The narrator waxes warm with his description, and tells us that the smoke created so much terror that many poor wights confided themselves to the flood, only, alas! to perish in water and mud.

Our guns we kept firing, still shooting amain,
Whilst many a proud Spaniard was on the place slain:
The rest being amazed, for succour did cry:
But all was in vain—they had nowhere to flee.
At last being forced, they thought it most fit
Unto the brave Englishmen for to submit.
And so a conclusion at last we did make,
Upon such conditions as was fit to take.

And there the matter ended. But our loyal ballad-writer has a few more words to say, inspired by a high patriotic admiration; and thus he spake:

The Spanish Armada did England no harm;
'Twas but a bravado to give us alarm;
But with our fine frigates we did them bombast,
And made them of Englishmen's valour to taste.
When this noble victory we did obtain,
Then home we returned to England again,
Where we were received with welcomes of joy,
Because with the frigates we did them destroy.

And so endeth this naively told tale.

That there are some graphic bits of description, we must confess; and as for the warlike and patriotic feeling it displays, we can only say that it is admirable. Of its historical value we will not say much. It depicts, truthfully enough, however, some of those desperate descents our sailors were wont to make in those days on the Spanish coast and on her rich colonies. These sudden expeditions, though actuated by patriotic motives, only too often assumed the form of lawless and almost piratical maraudings. But we must take the times as they were, and this spirited ballad gives us a capital insight into the feelings of the people and the kind of maritime adventures of those distant days.

The black-letter *Royal Victory* obtained (with the *Providence of Almighty God*) against the *Dutch Fleet*, June 2d and 3d, 1665, is a very good type. We are told to be merry without exception:

Let England, Ireland, and Scotland rejoice,
To render thanksgiving with heart and voice,
That surly fanatic that now will not sing,
Is false to kingdom, and foe to the king. . . .
For why should my nature or conscience repine
At taking of his life, that fain would take mine?

A pertinent query enough, but one which involves many serious questions.

Ritson, in his collection of Songs and Ballads, has preserved a very brilliant one, commemorating Admiral Russell's victory over the Chevalier de Tourville. The engagement took place on the 22d of May 1692, off the coast of Normandy, and was fought between ninety-nine English ships of the line and an almost equal force of French men-of-war, which French fleet was about to make a descent upon fair England with the view of replacing James II. on his throne. The Chevalier de Tourville had his flag hoisted on board *Le Soleil Royal*, a magnificent ship, the largest, indeed, that had ever been built. It is this *Soleil Royal* which is justly the centre figure, as it were, of the ballad.

Thursday in the morn, the ides of May,
Recorded for ever the famous ninety-two,
Brave Russell did discern, by dawn of day,
The lofty sail of France advancing now.
'All hands aloft, aloft; let English valour shine:
Let fly a culverin, the signal of the line;
Let every hand supply his gun;
Follow me,
And you'll see
That the battle will be soon begun.'

Tourville in his splendid ship, and his fleet about him, bore down upon the British line, determined to sink Russell beneath his feet; but both sides were thirsting for victory; the encounter was terrible:

And mighty Fate stood looking on,
Whilst a flood,
All of blood,
Filled the scupper-holes of the *Royal Sun*.

Sulphur, smoke, and fire filled the air; while the French on shore, looking eagerly on, were alarmed by the continual roar of the contending cannon. All in vain did the brave Frenchmen stick to their guns; the red ensign flew out victorious. The vessels with their gay banners bearing the flower-de-luce, fly before the British fire, even seeking destruction amidst the rocks and on sands, to the

horror of the spectators on land. *Le Soleil Royal* is lost on the strand :

For evermore adieu, thou *Royal Sun*. . . .
Enough, thou mighty god of war !
Now we sing,
Bless the king ;
Let us drink to every British tar.

But let us turn from the scenes of war to those of peace. We have a very graphic description of the hardships of a sailor's life in *Neptune's Raging Fury*; or, *the Gallant Seamen's Sufferings*. It has a lengthy sub-title, which we need not transcribe, for the song itself will tell us all we want to know, and to it we turn.

You gentlemen of England
That live at home at ease,
Ah, little do you think upon
The dangers of the seas !

They are manifold and terrible ; and ye youngsters, take warning, for

All you that will be seamen
Must bear a valiant heart,
For when you come upon the seas,
You must not think to start.

As for us, the seamen :

If enemies oppose us,
When England is at wars
With any foreign nations,
We fear not wounds nor scars ;
Our roaring guns shall teach 'em,
Our valour for to know,
Whilst they reel in the keel,
When the stormy winds do blow.

And, moreover, the storm is often fierce :

In claps of thunder
Which darkness doth enforce. . . .
Sometimes in Neptune's bosom
Our ship is tost in waves,
And every man expecting
The sea to be their graves ;
Then up aloft she mounteth,
And down again so low ;
'Tis with waves, O with waves,
When the stormy winds do blow.

The marine bard does not forget to dwell on the other dangers—of climates, strange savages, and other wonders. But then, when the jolly 'salts' are back in port amidst relatives and friends, they show they have warm hearts, and wish all and sundry to join in their merriment and joy.

On the whole, these sea-songs, with which we conclude these papers, are fresh and rollicking, smell of the 'briny,' have more heartiness and less bravado than the same class of military war-songs. Both classes, however, are fairly illustrative of different phases of English life and thought.

A MOUNTAIN STREAM.

NATURE, in her wondrous kindness to mankind, has placed many a tranquil and cool valley along the sunny Mediterranean shore: delightful retreats where one may take refuge from burning sun-rays. For when the heat becomes intense during the May summer days, even the natives are chased indoors, glad to retire into darkened rooms, and perchance sleep, until the fiery chariot has nearly run its course. Then they come forth and watch the Lord of Day preparing to retire far beyond the stern gray mountains, behind a

crimson curtain inlaid with gold, suffusing the attendant hills and cloudlets with his glory, while the sea gently tosses to and fro sparkling ruby bubbles.

Now, every mortal does not possess the god-like power of compelling Morpheus to come to his aid, and to such as do not, during the May mid-day sun the mountain valleys are as an earthly paradise. The stream at its birth, bubbling up from primeval rock, comes to light as cold as ice and as pure as crystal. Overflowing its natural basin, it runs its course amidst hard and rugged rocks, plashing with gentle bell-like sound over a perpendicular fall, sending up clouds of soft spray, while the waters below are tossed against jagged rocks into gay and sportive foam. It rests not ; on it leaps, meandering along over its stony bed, between the gray bare mountains, gathering force as it goes, until it gradually finds its way into a deeper, cooler, more silent, and luxuriant retreat. The silvery water is now in the true valley ; and here may be found that repose from care or the tyranny of the burning orb, whose face may not be looked on in its mid-day splendour.

How peaceful everything is !—the silence only broken by the music of the stream on its headlong and heedless journey. In ambitious rivalry, we have the gladsome song of the birds, flying busily from tree to tree, and hastily retiring from a noisy bath in a crystal pool on the approach of human footsteps. On and on the water flows, over rock, sand, pebbles, and stones ; now cosily retreating under the shelter of high and hanging banks, almost hidden beneath rich masses of vegetation, then emerging into full view and tumbling merrily over the pebbles ; anon filling up a wide pool, as though it would usurp the whole width of the valley. Suddenly swirling round with startling rapidity, it sweeps everything before it, carrying off a plank of wood, a leaf, or a luckless beetle in bewildering gyrations to the middle of the stream ; hurrying off in breathless haste over stones, past waving reeds, and then, as though tired of its game, landing its prey on a sandy bank, sharply turning aside to follow its bent, and repeat its vagaries over and over again.

Like the melodious stream, let us go peeping everywhere. Here under the bank we may see the industrious ants bringing food to their habitations ; their interference with nature seemingly only beneficial ; they do no harm. The nest lies close beside a brier root ; and not two paces off, the late violet and primrose mingle their sweet fragrance in the air. Just a few inches farther on we espy the curious retreat of the trapdoor spider, that wonderful and most intelligent of insect house-builders, now choosing a grassy patch for the site of its abode, now a mossy bank, or perchance a sandy soil, and cleverly adapting its architecture to its surroundings. A beetle with an outer coat of green and gold most marvellously blended, finds a home in the heart of a ruddy dogrose, while the brick-red and black-spotted wax-like little ladybird flies from leaf to leaf.

But, like the gorgeously coloured butterflies,

we must flit from spot to spot; staying to watch the odd antics of the pixies' ferrymen or water-spiders, as they skate rapidly over the glassy water; or, moving swiftly forward, endeavouring to catch a glance of the erratic cuckoo, or see the energetic woodpecker in the act of performing its loud rap-rap-tap on the hollow bark of the cork-tree as it speeds on its upward course. No excessive heat can reach deep down into these peaceful regions, and the vegetation sprouts up with magic luxuriance. The tall graceful trees tower above flowering shrubs with their variegated greens relieved by the late blushing roses, pure white clematis, golden honeysuckle, and pink bramble flowers. Under this shelter, again, are flowers innumerable, peeping out of the grass and bed of sear and yellow leaves. Closer to the water, the quivering maiden-hair hangs its exquisite fronds, mingling with the hardy harts-tongue, which forces its way between the stones, and bathes its curved glossy leaves in the sparkling stream. On that steep sandy bank, the Barbary fig or prickly-pear offers a formidable barrier to the too adventurous climber; its thick leaves, covered with the smallest and most irritating prickles, are enough to put the most daring to flight. Notwithstanding its beautiful yellow and bright orange-coloured flowers, the plant has a very ungainly and eccentric look. Yet it is useful, for it will grow where no other plant but the cactus would, and makes a really efficacious hedge. The common stonepine probably is, after the Barbary fig, the least exacting of plants as regards soil; provided its roots encounter nothing more formidable than sand-rock, it will make itself a home and flourish. It is, however, too often the victim of a cruel plague of caterpillars (*Bombyx processionaria*), which build their nests among the spiky leaves and devour every atom of green. When that is accomplished, they migrate in long processions to a fresh tree, and thus soon destroy a healthy clump of pines. It is very curious to see these long lines of caterpillars on their voyages of discovery making their way from tree to tree in perfect order.

A little farther down the valley, the opposite side offers a strange contrast—the banks are gentle slopes covered with rich grass, watered, and kept emerald green by tiny trickling streams, and shaded by chestnut trees. These tall trees, with their long straight trunks and graceful bouquets of broad tender green leaves, form an exquisite frame to the humble shepherd's hut, built of rough chestnut logs, and roofed with boughs, wherein the weary man lies down at night to rest his tired limbs on a couch of dried leaves, unconscious of the majestic beauty of the scene outside, as the setting sun reddens the sky with fire, warming the trees and rocks with pink tints, and seems to turn the water below into a gory stream. As the sun dips, and dim twilight takes the place of its warm rays, the heavens become crowded with bright twinkling stars, and the butterflies in all the glory of their gorgeous colours retire to their mysterious resting-places, while the moths, nocturnal spiders, crickets, and noisy frogs come forth to sport, and the cool evening air echoes faintly the myriad sounds of busy insect and animal life.

Poets should live here and sing of these various beauties, and the changing aspects that come and

go as the day waxes and wanes and the season gives way to season. What lessons might be drawn from the industrious ant; the busy bee as it flies from flower to flower in this beautiful garden of nature's own designing and planting; the ingenious trapdoor spider at the bottom of its home in the depths of mother earth; the birds with their bright and gladdening hymns of life and joy; from the lovely delicate flowers peeping from amidst their verdant beds, each at its appointed time, and lifting their pure coloured petals towards the light from above! What songs of tender, peaceful thoughts might be sung of the silver moon as it arose and suffused the silent valley with soft pure light, the rays turning the rippling water into a stream of molten silver, now bright and glistening, now inky, and almost appalling in its dark, and seemingly unfathomable depths! What glorious thoughts would steal upon the poet as he listened to the sighing of the boughs, the rustling of the leaves, all reflecting the pale light of the midnight moon, as they bent under the gentle breeze, sweeping down from rocky fastnesses high in cold regions to the rippling sea!

THE COUNTRY DANCE.

Who comes here, with patch on cheek,
Looking so demure and meek,
Moving slowly, shy of glance,
Through the quaint old country dance?
Who's this, with an air of grace,
As they move in measured pace,
Meets her, greets her, bowing low?
'Tis her rich and lordly beau!
Who, here, looks across the room,
Heart of doubt and brow of gloom?
Ah, the song has oft been sung;
'Tis her suitor poor and young!
But he meets her roving eyes,
Sees the blushes sweet that rise;
Ah, what matters what may be—
They are lovers, he and she!

But the dance is over now,
Sweeping curtsey, courtly bow;
Beats one true heart 'mid the press;
Is it no, or is it yes?
Once, just once, their glances meet—
Ah, it is the signal sweet;
Where's the one white rose she wore?
Lying there upon the floor!
Hark, the clock is striking four;
Who's this at the postern door,
Cloaked and hooded, in alarm,
Clinging to her lover's arm?
Fare thee well, O lordly beau—
They'll be wed long ere you know.
Love that has the will, folk say,
Soon or late will make the way!

THE PROPOSED NATIONAL CANAL.

So long have we been accustomed to the development of railway enterprise, that we are apt to regard with indifference, if not with a species of scorn, the idea of perfecting the internal communication of the country by means of waterways. The iron-horse, it has been long supposed, has driven away the canal boat from the active lines of industry, and the uses of canals seemed destined to be consigned to the limbo of ancient history or left to the monopoly of the Dutch. But this is a great error, and all the greater because it is so common. Undoubtedly, the canal system of the United Kingdom did suffer a very severe blow when the railway enterprise bloomed and 'boomed' under 'King Hudson.' More recent experience, however, has shown that canals are not necessarily competitors of railways—that they are more often auxiliaries—and that they are capable of performing services to the community which railways cannot achieve; or, to put it in another form, which it can never pay railways to attempt. Let us not forget that the prosperity of the Dutch, the most enterprising, commercial, thrifty, and successful people in the world—next, of course, to our noble selves—is founded upon canals; and that a large measure of the prosperity of the United States is also due to the immense advantages presented by the great continuous line of waterways which human ingenuity has contrived out of natural provisions. There is no country in the world in which railways occupy a more prominent and important place than in America, yet canals there are neither scorned nor neglected, but are carefully preserved and industriously extended in all directions as feeders to and aids of the railways.

This nineteenth century, too, is notable for, and will in future generations be famed for, the prosecution of the three largest and most remarkable enterprises in the construction of artificial channels ever known. The Suez Canal, of course, is no novelty to us now, and that a canal across the isthmus existed in the days of the ancient

Egyptians is supposed to be known to every schoolboy. But there is a very wide difference between the Egyptian ditch and the noble channel which now enables stately five-thousand-ton steamers to pass without a pause from the Mediterranean to the Red Sea. The Panama Canal, if not yet an accomplished fact, is actually in process of formation, and in many respects is a more remarkable work than that which pierces the Isthmus of Suez. And then the Manchester Ship Canal is one of the pet projects of the day in our own country, and is probably destined to enable the inland capital of the cotton trade to rank among the seaports of the world.

In fact, renewed attention is being given by engineers and traders and capitalists to the many and great attractions of inland waterways for the promotion of commerce and the development of industrial enterprise. If we look at a railway map of the British Isles we shall see that there is practically no further room for railway extension in the matter of trunk-lines. Branches and feeders are needed, and are being constructed wherever the traffic, present or prospective, seems to warrant the outlay; but no more great iron arteries can be added to the land until new centres of industry are created. Not only is the first cost of a railway immense, but the annual outlay necessary for maintenance and working it is enormous. Unless there is a very large traffic, there must be very high charges for carriage, so as to cover actual expenses. Now, whatever may be the comparative cost in the construction of a canal, it is obvious that the cost of maintenance and working must always be insignificant in comparison with a railway. The 'silent highway' can afford to wait for traffic, because it costs next to nothing to lie idle.

Few people are perhaps aware that we have actually over 3900 miles of canals already in the United Kingdom, and that many of these canals pay very handsome dividends to the proprietors of them. Indeed, it may be said generally that canals yield a far higher percentage

overhead to the investing capitalists than do railways. We have now almost 20,000 miles of iron road to our 3900 miles or so of water-road, and 2500 miles of navigable rivers. In China, the Grand Canal stretches for over 2000 miles, and connects with some fifty cities. The latest returns give the length of navigable canals in the United Kingdom at 3931 miles, of which about three hundred miles are in Ireland.

Canal-making in this country may be said to have begun in the year 1761, for it was in that year that the Bridgewater Canal was definitely projected. The scheme was as hotly opposed as, at a later period, was that of railway construction. The landowners and other representatives of 'vested interests' threw every obstacle in the way. It was asserted that the rivers were quite sufficient for all the traffic there was or could be, and that canals would displace the packhorses and wagons which had been so serviceable, and would also injure the trade of the towns through or near which they would pass. Dr Samuel Johnson, philosopher though he was, could only see in canals a means for destroying 'country seclusion,' and for making food dear where it used to be cheap, by taking rural produce to crowded centres!

But in spite of opposition, the Bridgewater Canal was begun in 1767, and was opened in 1772, to the great profit of its promoters and the great advantage of the public. It was followed by quite a number of smaller enterprises; in fact, prior to 1800, there was a canal mania almost as great as the railway mania which set in about 1844. It has been said of this canal era, by Mr Clifford, in his *History of Private Bill Legislation*, that 'Parliament by its furtherance of legislation for the development of canals and of agriculture, probably contributed more largely to the national prosperity than by any other group of public or private measures passed towards the close of the last century.' Before the nineteenth century opened, over a hundred Canal Acts had passed through Parliament. Upon at least one of these canals—the Forth and Clyde—a steam-vessel was employed to draw the barges as far back as 1785.

But it is certainly remarkable that a country so naturally adapted for canals as is Great Britain should not have developed them to a much greater extent. We have a large number of copious rivers, we have a most favourable watershed, we have an ample rainfall to keep up the supply of water, and we are encircled by the sea. There is probably no country in the world so well adapted for the construction of artificial waterways, and this is a fact which now seems to be becoming more and more generally recognised. The tediousness of transport by the old mode of traction by horses is no longer a deterrent; for steam can be employed to secure transport, if not so rapid as by railway, at least rapid enough for a certain class of traffic.

Of the comparative cost of railway and canal transits, we have seen various estimates. But one authority puts it that the cost of conveying a ton of goods by railway is 1·21d. for every mile traversed; while the cost of conveying a ton by canal is only 0·37d. for every mile

traversed. This means the actual cost of carrying, and does not include the charges for handling, which are vastly greater on a railway—for the loading, unloading, packing, arranging, shunting, &c., of trucks. Roughly speaking, the cost of conveying traffic by canal is from a fourth to a fifth of the cost of conveyance by railway. There is less speed by the canal, but there is also less handling, which in many cases is a very great advantage indeed.

The great defect in the canal system of this country is that it has not been constructed on any uniform principle. Thus, the traffic is not interchangeable, or is so only to a limited extent. There are different widths and depths, different-sized locks, different tolls and regulations, on the existing waterways. The largest, we believe, is that of the Severn Canal, which admits vessels two hundred and seventy feet long by thirty-five feet broad; the Aire and Calder comes next, with two hundred and twelve feet by twenty-two feet; and the Gloucester and Birmingham Canal can only pass vessels one hundred and sixty-three feet long by twenty-nine feet broad. It should be mentioned that a large proportion (about one-third) of the canals in existence are now owned by Railway Companies, who use them as feeders. This is all very well, but it prevents the healthy competition of rates, which some of our industries would be the better of, in view of the advantages which foreigners have in transmitting their produce to our great ports.

There is at present a notable project for the canalisation of Great Britain. The idea is, so to utilise and enlarge existing waterways as to make a continuous navigable channel for ships from London to Liverpool, and from the Severn to the Humber. The two lines would cross at Birmingham in something like this form X, and the effect would be to cut England into four islands, and to unite the four tidal rivers—the Thames, the Mersey, the Severn, and the Trent. Already, indeed, schemes are actually under weigh for the improvement of the Severn and the Trent, and it is noteworthy that the latter river was, even so recently as forty years ago, navigable as far up as Burton. To re-open the channel, and, by utilising the river Tame, to carry it in to Birmingham, is not a very stupendous task, and involves no engineering difficulties. Not only Birmingham, but a whole nest of populous towns—West Bromwich, Wednesbury, Walsall, Willenhall, Wolverhampton, Tipton, and Dudley, with the adjacent coal-fields, all lie in the basin of the Humber, and are drained by tributaries of the Trent. There is already a canal between Birmingham and London; there is a system of canals between Birmingham and Liverpool, and there is in project a canal from Birmingham to the Severn. It is only needful to bring them all under one uniform system, to enlarge, deepen, and modify those in existence, so as to complete the grand work. This is the scheme which is being advocated under the name of 'A National Canal,' and which Mr Samuel Lloyd of Birmingham has recently explained in an interesting pamphlet. A great deal of data is advanced in support of the contention that it will 'pay;' and the great object is the national one of encouraging the industries of the large inland populations, who are at present severely handi-

capped by their distance from ports. 'Many favourable sites for industrial villages,' says Mr Lloyd, 'would be found along its course, and the dwarf walls would afford places for good wharfs, available for the loading and unloading of heavy goods. The rateable value of hundreds of square miles would increase, and new traffic, the inevitable result of an increased population, would be brought into existence. Farmers on each side of the canal within a day's drawing for their teams, with the various wharfs, would be able to deliver their agricultural crops to the boats or barges; and tens of thousands of tons of produce would be delivered to the ever-increasing populations on the banks of the Thames and Mersey so cheaply as to prevent their importation from abroad. Ten miles on each side of the canal, by three hundred length through agricultural land, makes six thousand square miles in the heart of Old England directly benefited.'

We cannot here go into the commercial and financial aspects of the scheme. But it is proposed that the canal should be so constructed as to be available for the passage of swift gunboats and torpedo-boats, which could thus pass rapidly in time of need from point to point of our coasts without the tedious and dangerous passage round Land's End. To do this would, of course, add greatly to the cost of construction; but the obvious advantages of such a waterway for the purposes of national defence are put forward in favour of making the scheme in every sense a national one. Upon these points, however, we do not enter.

THIS MORTAL COIL.

CHAPTER XLVI.—THE TURN OF THE TIDE.

AT Paris, Warren Relf parted with Elsie. He saw her safely to the Northern Railway Station, put her into the first night-train for Calais, and then wriggled back himself to his temporary lair, a quiet hotel on the Cours-la-Reine, just behind the Palais de l'Industrie. He went back to bed, but not to sleep. It was a gusty night, that night in Paris. The wind shook and rattled the loose panes in the big French windows that opened on to the balcony; the rain beat wildly in sudden rushes against the rattling glass; the chimneys on all the neighbouring roofs moaned and howled and shivered in concert. Warren Relf reproached himself bitterly, as he listened to its sound, that he hadn't decided on escorting Elsie the whole of her way across to England. Mrs Grundy would no doubt have disapproved, to be sure; but what did he care in his heart, after all, for that strange apotheosis of censorious matronhood? It would have been better to have seen Elsie safe across the Channel, Mrs Grundy to the contrary notwithstanding, and installed her comfortably in London lodgings. He wished he had done it, now he heard how the wind was roaring and tearing; a north-east wind, yet damp and rain-laden. Warren Relf knew its ways and its manners full well. It must be blowing great-guns across the North Sea now, he felt only too sure, and forcing whole squadrons of angry waves through the narrow funnel of the Straits of Dover.

As the night wore on, however, the wind rose steadily, till it reached at last the full dignity of a regular tempest. Warren Relf couldn't sleep in his bed for distress. He rose often, and looked out on the gusty street for cold comfort. The gas was flaring and flickering in the lamps; the wind was sweeping fiercely down the Cours-la-Reine; and the few belated souls who still kept the pavement were cowering and running before the beating rain with heads bent down and cloaks or overcoats wrapped tight around them. It must indeed be an awful night on the English Channel; Warren stood aghast to think to himself how awful. What on earth could ever have possessed him, he wondered now, to let Elsie make her way alone, on such a terrible evening as this, without him by her side, across the stormy water!

He would receive a telegram, thank Heaven, first thing in the morning. Till then, his suspense would be really painful.

As for Elsie, she sped all unconscious on her way to Calais, comfortably ensconced in her first-class compartment 'pour dames seules,' of which she had fortunately the sole monopoly. The rain beat hard against the windows, to be sure; and the wind shook the door with its gusts more than once, or made the feeble oil-lamp in the roof of the carriage flicker fitfully; but Elsie, absorbed in deeper affairs, hardly thought of it at all in her own mind till she reached the stretch of open coast that abuts on the mouth of the Somme near Abbeville. There, the fact began at last to force itself upon her languid attention that the Channel crossing would be distinctly rough. Still, even then, she hardly realised its full meaning, for the wind was off-shore along the Picardy coast; and it was not till the train drew up with a dash on the quay at Calais that she fully understood the serious gravity of the situation. The waves were breaking fiercely over the mouth of the harbour, and the sea was rising so high outside that passengers were met with stern resolve at the terminus wall by the curt notice:

'Owing to the rough weather prevailing to-night, the Dover boat will not sail till morning.'

So Elsie went perforce to an hotel in the town and waited patiently for the sea to calm itself. But she, too, got no sleep; she lay awake all night, and thought of Winifred.

Away at Monte Carlo, no wind blew. Hugh Massinger went to rest there at his ease at the *Hotel de Paris*, and slept his sleep out with perfect complacency. No qualms of conscience, no thoughts of Winifred, disturbed his slumber. He had taken the precaution to doubly lock and bolt his door, and to lay his winnings between the bolster and the mattress; so he had nothing to trouble about. He had also been careful to purchase a good six-chambered revolver at one of the numerous shops that line the Casino gardens. It isn't safe, indeed, at Monte Carlo, they say, for a successful player, recognised as such, to go about with too much money as hard cash actually in his possession. Raffakevsky, in fact, had told him, with most unnecessary details, some very unpleasant stories, before he retired to rest, about robberies committed at Monte Carlo upon the helpless bodies of heavy winners. Raffakevsky was clearly in a savage ill-temper that evening at having dropped a few thousand pounds at the

tables—strange, that men should permit themselves to be so deeply affected by mere transient trifling monetary reverses—and he took it out by repeating or inventing truculent tales, evidently intended to poison the calm rest of Hugh Massinger's innocent slumbers. There was that ugly anecdote, for example, about the lucky *boulevardier* in the high financial line who won three hundred thousand francs at a couple of sittings—and was murdered in a first-class carriage on his way back to Nice by an unknown assailant, never again recognised or brought to justice. There was that alarming incident of the fat Lyons silk-merchant with the cast in his eye who deposited his gains, like a prudent bourgeois that he was, with a banker at Monaco, but was nevertheless set upon by an organised band of three well-dressed but ill-informed ruffians, who positively searched him from head to foot, stripped him, and then threw him out upon the four-foot way, a helpless mass, in the Mont Boron Tunnel, happy to escape with bare life and a broken leg from the merciless clutches of the gang of miscreants. And there was that dramatic incident of the Nevada heiress who, coming to Monte Carlo with the gold of California visibly bulging her capacious pockets, had to fight for her life in her own bedroom at this very hotel, and defend her property from unholy hands by the summary process of shooting down with her own domestic revolver two of her cowardly midnight visitors. She was complimented by the authorities on her gallant defence, and replied with spirit that, for the matter of that, this sort of thing was really no novelty to her; for she'd shot down more than one importunate suitor for her hand and heart already in Nevada.

Then Raffalevsky had grown more lugubrious in his converse still, and descended to tales of the recurrent suicides that diversify the monotony of the Monegasque world. He estimated that twelve persons at least per annum, on a moderate average, blew their brains out in the Casino and grounds, after risking and losing their last napoleon at the roulette tables. To kill yourself in the actual saloons themselves, he admitted with a sigh, was indeed considered by gentlemanly players as a boorish solecism: persons of breeding, intent on an exit from this vale of tears, usually retired for the purpose of shooting themselves to a remote and sequestered spot in the Casino gardens, behind a convenient clump of picturesque date-palms. This spot was known to habitual frequenters of Monte Carlo as the *Place Hari-kiri*, or *Happy Despatch Point*. But if, by hazard, any inconsiderate person was moved to shoot himself in the *salles de jeu*, a rapid contingent of trained lackeys stood ever at hand ready to rush in at a moment's notice to drag away the offender's body or wipe up the mess; and play proceeded at once the same as usual.

Nevertheless, Hugh slept soundly in spite of it all in his bed till morning, and when he woke, found his goodly pile of gold and notes intact as ever between bolster and mattress. He had never slept so well since he went to Whitestrand.

But at Whitestrand itself that night things went quite otherwise. Such a storm was hardly remembered on the German Ocean within the memory of the oldest sailors. Early in the even-

ing, the coastguardman at the shelter just beyond the Hall grounds, warned by telegram from the Meteorological Office, had raised the cone for heavy weather from the north-east. By nine o'clock, the surf was seething and boiling on the bar, and the waves were dashing themselves in huge sheets of foam against Hugh Massinger's ineffectual breakwater. The sand flew free before the angry gusts: it blinded the eyes and filled the lungs of all who tried to face the storm on the sea-front: even up the river and at the Hall itself it pervaded the air with a perfect bombardment of tiny grains. It was only possible to remain outdoors by turning one's back upon the fierce blast, or by covering one's face, not with a veil, but with a silk pocket-handkerchief. The very coastguardmen, accustomed by long use to good doses of solid silica in the lungs, shrank back with alarm from the idea of facing that running fire of driven sand-particles. As for the smacks and boats at large on the sea, they were left to their fate—nothing could be done by human hands to help or save them.

By midnight, tide was well at its full, and, the beach being covered, the bombardment of sand slowly intermitted a little. But sheets of foam and spray still drove on before the wind, and fishermen, clad in waterproof suits from head to foot, stood facing them upon the shore to watch the fate of Hugh Massinger's poor helpless breakwater. The sea was roaring and raving round its sides now like a horde of savages, and the scour was setting in fiercer than ever to wash away whatever remained of Whitestrand.

'Will it stand, Bill?' the farm-bailiff asked in anxious tones of Stannaway the innkeeper, as they strained their eyes through the gloom and spray to catch sight of the frail barrier that alone protected them—the stone breakwater which had taken the place of the old historical Whitestrand poplar.

Stannaway shook his head despondently. 'Sea like that's bound to wash it away,' he answered hard through the teeth of the wind. 'It'd wash away anything. An' when it goes, it's all up with Whitestrand.'

The whole village, indeed, men, women, and children alike, had collected by this time at the point by the river, to watch the progress of the common enemy. There was a fearful interest for every one of them in seeing the waves assail and beat down that final barrier of their hearths and homes. If the breakwater went, Whitestrand must surely follow it, now or later, bit by bit, in piecemeal destruction. The sea would swallow it up wholesale, as it swallowed up Dunwich and Thorpe and Slaughden. Those domestic examples gave point to their terror. To the Suffolk coast-dwellers, the sea indeed envisages itself ever, not as a mere natural expanse of water, but as a slow and patient yet implacable assailant.

By two in the morning, a fresh excitement supervened to keep up the interest: a collier hull, deserted and waterlogged, came drifting in by slow stages before the driving gale across the broad sand-flats. She was a dismasted hulk, rickety and unseaworthy, abandoned by all who had tried to sail her; and she drifted slowly, slowly, slowly on, driven before the waves, foot by foot, a bit at a time, over the wet sands, till at last, with one supreme effort of force, the breakers

cast her up, a huge burden, between the shore and the breakwater, blocking with her broadside one entire end of the channel created by the scour behind the spot once occupied by the famous poplar. The waves, in fact, dashed her full against the further end of the breakwater, and jammed her up with prodigious force between shore and wall, a temporary barrier against their own advances. Then retiring for a moment to recruit their rage, they broke in sheets of helpless foam against the wooden bulwark they had raised themselves in the direct line of their own progress.

What followed next, followed so fast that even the sturdy Whitestrangers themselves, accustomed as they were to heavy seas and shifting sands and natural changes of marvellous rapidity, stood aghast at its suddenness and its awful energy. In a few minutes, before their very eyes, the sea had carried huge masses and shoals of flying sand over the top of the wall and the stranded ship, and lodged them deep in the hollow below that the scour had created in the rear of the breakwater. The wall was joined as if by some sudden stroke of a conjurer's wand to the mainland beyond; and the sea, still dashing madly against the masonry and the ship, set to work once more to erect fresh outworks in front against its own assaults by piling up sand with incredible speed in dunes and mounds upon their outer faces. Even as they looked, the breakwater was rapidly lost to view in a mountain of beach: the broken stump of mast on the wrecked collier hardly showed above the level of the mushroom hillock that covered and overwhelmed with its hasty debris the buried hull of the unknown vessel. Hummock after hummock grew apace outside with startling rapidity in successive lines along the shore to seaward. New land was forming at each crash of the waves. The Æolian sand was doing its work bravely. By five in the morning, men walked secure where the sea had roared but six hours before. It had left the buried breakwater now a quarter of a mile inland at least, and was still engaged with mad eagerness in its rapid task of piling up fresh mounds and heaps in endless rows, to seaward and to seaward and ever to seaward.

Whitestrang was saved. Nay, more than that: it was gaining once more in a single night all that it had lost in twenty years to the devouring ocean.

When morning broke, the astonished Whitestrangers could hardly recognise their own beach, their own shore, their own salt marshes, their own river. Everything was changed as if by magic. The estuary was gone, and in its place stretched a wide expanse of undulating sandhills. The Char had turned its course visibly southward, bursting the dikes on the Yondstream farms, and flowing to the sea by the old channel from which Oliver's engineers had long since diverted it. The Hall stood half a mile farther from the water's edge than it had done of old, and a belt of bare and open dune-land lay tossed between its grounds and the new high-tide mark. The farm-bailiff examined them in the gray dawn with a practical eye. 'If we plant them hills all over with maram-grass and tamarisk,' he said reflectively, 'they'll mat like the other ones, and Squire'll have as many acres of new pasture-land north o' Char as ever he lost o' salt marsh and meadow south of the old river.'

If Hugh Massinger had only known it, indeed, the storm and the strange chances of tempest had done far more for him that single night while he slept at Monte Carlo than luck at roulette had managed to do for him the day before in that hot and crowded sink of iniquity in the rooms of the Casino.

For from that day forth Whitestrang was safe. It was more than safe; it began to grow again. The blown sand ceased to molest it: the sea and the tide ceased to eat it away: the breakwater had done its work well, after all; and a new barrier of increasing sandhills had sprung up spontaneously by the river's mouth to guard its seaward half from future encroachment. If Hugh could only have known and believed it, the estate was worth every bit as much that wild morning as ever it had been in the palmiest days of the Elizabethan Meyseys. And the family solicitor, examining the mortgages in his own office, remarked to himself with a pensive glance that the Squire might have raised that little sum, if only he'd waited, at scarcely more than half the interest, on his own security and his improved property. For Whitestrang now would fetch money.

SYMBIOSIS.

HERE is a word but recently coined in the mint of Science, and hence rarely found even in our new dictionaries and cyclopædias. Compounded of two Greek words, it signifies the living together for mutual benefit of very dissimilar types of life; but here it must not be supposed that parasitic life is suggested. The equivalent term to *symbiosis* is *commensalism*, that is, a dining at the same table.

The phenomena are remarkable, and occur more widely throughout organic existence than they have hitherto been supposed. We may roughly divide these cases of mutual support or co-operation into three classes—those of animals with animals; of plants with animals; and of plants with plants.

One of the earliest noticed instances of this clubbing together of creatures of very different species is that to which Herodotus refers as follows: 'As the crocodile lives chiefly in the river, it has the inside of its mouth constantly covered with leeches. Hence it happens that while all other birds and beasts avoid it, with the trochilus it lives at peace, since it owes much to that bird; for the crocodile when he leaves the water and comes out upon the land is in the habit of lying with its mouth wide open, facing the western breeze. At such times the trochilus goes into his mouth and devours the leeches. This benefits the crocodile, who is pleased, and takes care not to hurt the trochilus.'

In this exchange of benefits the poet Spenser saw an instance of 'the small constraining the mightie.' He thus describes the crocodile and his benefactor:

Beside the fruitful shore of muddy Nile,
Upon a sunny bank outstretched lay,
In monstrous length, a mighty crocodile,
That, cramm'd with guiltless blood and greedy prey
Of wretched people travelling that way,
Thought all things less than his disdainful pride.

When there came along

A little bird call'd Tedula,
The least of thousands which on earth abide ;

and which

Forced this hideous beast to open wide
The grisly gates of his devouring hell,
And let him feed, as Nature did provide,
Upon his jaws, that with black venom swell.

But a poet of our century sees in this little bird
an emblem of audacity, for Moore sings of

The puny bird that dares with teasing hum
Within the crocodile's stretched jaws to come.

What 'the father of history' so plainly states, the bird actually does, for one of the most familiar objects on the Nile banks is the sic-sac plover, which the modern traveller may sometimes see in the act of feeding within the extended jaws of 'the autocrat of all the Rushes.'

But, strange to say, the crocodile has another companion, one who is a born sycophant, for the 'monitor lizard' warns him of coming danger by running before him through the reeds and plunging into the water. He, however, does not forget to eat the crocodile's eggs and young whenever there is a chance. What a fine moral is here! The zealous sycophant will not let others rob the lordly man, but is, after all, not so zealous as to be quite disinterested.

Another example of this communal life is that the rhinoceros, and also hippopotamus, are often attended by small birds known as the rhinoceros birds. They feed on the ticks and parasites that infest these animals, and, moreover, serve to warn them of approaching danger.

A daily paper of March last reported that the Rev. L. M. Lyle, of Maryland, suspected that some one was fraudulently milking his cow. He kept watch, and discovered that a hog which ran in the same pasture was the culprit. There seemed to be a perfect understanding between the two; and the hog while taking his liquor sat on his haunches and grunted with supreme satisfaction. This little game has generally been laid to the charge of hedgehogs. Obviously, the cow was glad of the hog's attentions, because thereby its distended udder was relieved.

Marine life is rich in examples of commensalism. A graceful fish (*Donzelina*) seeks its fortune in the body of a holothuria or 'sea-cucumber.' Naturalists have long known it as the Fierasfer. It has an eel-like and scale-clad body, which is somewhat compressed. Lodging in the digestive tube of his companion, and regardless of this hospitality, he seizes on his share of all that enters. In their visits to the holothurians, the fierasfers are often accompanied by small crabs, &c. They are known in various seas, and all have similar habits.

The Angler or fishing-frog lodges in its enormous branchial sac a fish named *Apterychtus*. This same angler lives in the northern seas, and there it lodges an amphipod crustacean. Dr Collingwood saw a sea-anemone in the Chinese Sea at least two feet in diameter, and inside it lodged a frisky little fish, the name of which is not given.

Oxybelas, a fish of the Indian seas, takes up its abode in a starfish.—A siluroid or mud-fish of Brazil, which is a skilful fisherman, because of his

many barbules, lodges in the cavity of its mouth some very small fishes, long mistaken for young siluroids. These tenants are fully developed; but instead of living by their own labour, install themselves in their big friend's mouth and share what enters. Not unfrequently, small fishes may be seen alive within the bell-shaped hollow of some jelly-fishes.

The pilot-fish and shark furnish an instance of association at present unexplained. But the pilot has sometimes been confounded with a very different fish—that is, the remora. This latter is simply anchored to his host, and wants from him nothing more than to be towed through the sea. The Mozambique fishermen take advantage of this faculty to catch turtles and certain large fish.

Although symbiosis relates to non-parasitical modes of life, yet there are almost insensible gradations between parasites and messmates and some free animals. The changes which creatures of the barnacle kind termed Cirrhipedes undergo are very curious. At the first period of life they have an elegant body and beautifully divided fins, and their movements are as graceful as those of any insect. After freely swimming about for a time, they then select a resting-place in some retreat. But many settle on the back of a whale or a shark's fin, and are thereby enabled to get such food as comes within reach, while they cross the ocean. Each whale lodges a particular species of these cirrhipedes. The Great Whale of the north is, however, an exception, for it carries no such companions.

Some marine turtles bear many of these organisms. Sometimes they are accompanied by a whole forest of zoophytes, and hence the turtle so situated carries quite a motley colony on his back. Among fixed messmates are some very remarkable polyps. Many naturalists tell of vast colonies of these in which various animals find lodgment and shelter. Forster speaks of colonies not less than three feet in diameter and fifteen feet high, with a crown of eighteen feet diameter. Dana also mentions an *Astræa* or star-coral twelve feet high, and of another kind of coral twenty feet high, 'which contain more than five millions of individuals, among which a number of animals come to take refuge.'

Another set of creatures, too long regarded as parasites, are now known to be strictly scavengers. The commonest instance is that of the frog, certain canals of its body being always full of infusoria termed *Opalinæ*, which doubtless live on what they find there. Similar infusoria are also found in various sea-worms termed annelids.

Many creatures produce a large number of eggs, some of which decompose for want of fecundation, or die in course of development. Some years ago, Van Beneden made a most singular discovery bearing on the fact just referred to. He announced it in terms we cannot forbear quoting: 'It is known that lobsters, as well as crabs and the greater part of the crustacea, carry their eggs under the abdomen, and that these eggs remain suspended there till the embryos are hatched. In the midst of them lives an animal of extreme agility, which is perhaps the most extraordinary being which has been subjected to the eyes of a zoologist. It may be said, without exaggeration, that it is a biped or even quadruped worm. Let

us imagine a clown from the circus, with his limbs as far dislocated as possible, we might even say entirely deprived of bones, displaying tricks of strength and activity on a heap of monster cannon-balls, which he struggles to surmount, placing one foot formed like an air-bladder on one ball, the other foot on another, alternately balancing and extending his body, folding his limbs on each other, or bending his body upwards like a caterpillar of the geometridæ, and we shall then have but an imperfect idea of all the attitudes which it assumes, and which it varies incessantly. The lobster gives him a berth, and the passenger feeds himself at the expense of the cargo; that is to say, he eats the eggs and the embryos which die, and the decomposition of which would be fatal to his host and her progeny.* This remarkable creature, which is named *Histiobdella*, is provided with an egg-sucking apparatus. The common crab of our shores lodges a kind of threadworm or nemertian, which it is considered probably performs the same sanitary office. The sturgeon also lodges among its eggs a polyp which plays the same part.

A few other noteworthy examples of symbiosis must here be mentioned. A large species of bivalve (*Modiola*) of northern seas, and dwelling in deep water, always encloses a couple of crabs about the size of a hazel nut. Hundreds of these *modiolæ* have been opened, and never have been found without their crabs.—A little crab, near the coast of Peru, exists under somewhat different conditions; he lodges in a sea-urchin, and near the termination of its intestine. One crustacean, provided with beak and claws, enjoys himself in the pantry of a jelly-fish or medusa. Another kind of commensalism is that shown by the *Dromiæ*. These are ordinary-sized crabs, and lodge from earliest youth under a growing family of polyps, which increases with them. There is in the Mediterranean a species which sometimes comes to our coast.

The soldier-crabs look like little lobsters lodging in deserted shells. But the creature is not such a lonely hermit as it appears, because an annelid generally establishes itself by its side and takes the refuse food of its neighbour. Another soldier-crab which lives on our coasts has for its chief messmate a sea-anemone. This crab is remarkable for the attention it pays to its companion, for when he has fished, he always gives the choice bits to the anemone, and often during the day ascertains the state of its appetite.

Those animal-mosses of the sea, the Bryozoa, attach themselves to all kinds of solid bodies. One species is almost as a rule found on the common mussel. 'The class of polyps,' says Van Beneden, 'includes species which seek assistance from others, and are classed among messmates. The most remarkable is the gigantic Medusa, which can extend its arms to one hundred and twenty feet; the disc is seven feet and a half in diameter, and when the animal is on the surface of the water, the fringes which surround the cavity at its mouth occasionally afford lodging in the midst of them to a species of actinia, which lives there as a messmate.'

The beautiful sponge familiar to most persons as Venus's Flower Basket, is known to shelter three kinds of crustaceans. This sponge was first obtained from Japanese waters. But in the *Chal-*

lenger expedition, Sir Wyville Thomson found it to the south-west of Cape St Vincent at the immense depth of one thousand and ninety fathoms. Some sponges actually make a home inside another organism; for instance, a small one ensconces itself in the substance of the shell of oysters.

The insect world furnishes not a few instances of symbiosis. The fur of animals and the feathers of birds afford shelter to them. They live upon and thus remove from the superfluous hair or feathers the pellicle or skin débris which encumber them, thereby adding to the cleanliness and good looks of their host. In a word, they perform the same service as do some minute crustaceans for many kinds of fishes. They are not living at their host's expense, but for his benefit. There is a distinct species on each of the domestic animals, the ox, dog, and cat.

In his work on *Ants, Bees, and Wasps*, Sir John Lubbock remarks that 'the nests of our common yellow ant [*Lasius flavus*] contain in abundance four or five species of aphids,* more than one of which appears to be as yet undescribed. In addition, however, to the insects belonging to this family, there are a large number of others which live habitually in ants' nests, so that we may truly say that our English ants possess a much greater variety of domestic animals than we do ourselves. André gives a list of five hundred and eighty-four species of insects which are habitually found in association with ants, and of which five hundred and forty-two are beetles.

The caterpillar of that beautiful beetle the rose-chaffer finds congenial lodgings among the bits of stick collected by some ants, and with which they construct their nests. A species of *Podura*, a little white wingless insect, also runs about the chambers and galleries of the nests of English ants. Then, too, there is a white woodlouse quite as happily situated. This *podura* and the woodlouse are both blind, and most likely have become so because generations have thus lived in darkness. Sir John Lubbock thinks they have through this cause 'become blind'—'because their ancestors no doubt had eyes.' This naturalist goes on to say that the ants allow these insects to live in their nests, and that an interloper would be promptly killed. He thinks these insects may be scavengers.

But in other cases there is a closer bond of association, for many insects secrete a fluid which is food to ants. There is a little blind beetle with club-shaped antennæ which seems quite dependent on the ants. He appears not able even to feed himself, or at any rate is habitually fed by ants.

Of the association of plants with animals but a few examples can here be given. Within recent years, the important discovery has been made which serves to show how the supply of vegetable food on the ocean is supplemented, and accounts also for the enormous abundance of marine animal life. All over the ocean-surface in temperate regions there are immense numbers of Radiolarians. The *Challenger* sailed for days through water full of these small masses of living jelly, one of the most crowded regions being off

* The aphid is that common green, sometimes black insect found under the leaves of shrubs, and termed 'the blight' by English country-folk.

the Azores. These Radiolarians are transparent spheres with a globule of oil in them—such is their appearance under the microscope. When they want to rise to the surface, they expand the oil globule, and of course perform the converse in order to sink.

In one of his lectures on Ocean Life, Professor Moseley says: 'These animals have in them a number of minute yellow bodies (that is, *Xoos-anthella*), and these are of great interest and importance. They are really cells; they contain a nucleus and certain globules, which can be microchemically shown to be starch globules, and are provided by an outer wall, which by further chemical testing can be proved to consist of cellulose—as the walls of the component cells of the cabbage or potato. They are proved in this way to be really unicellular plants, minute algae which live combined with these oceanic animals. The animals apparently cannot get on without the plants, and the plants cannot get on without the animals. They live together by an arrangement of mutual benefit.' Nature's wondrous economy is here seen to perfection. The oxygen given off by the plant and the starch found in its cell serve to feed the animal. On the other hand, the carbonic gas and nitrogenous waste products given off by the animal nourish the plant.

The naturalist Mr Belt mentions a species of acacia which, if unprotected, is apt to be stripped of its leaves by a leaf-cutting ant, which uses leaves not directly for food, but to grow mushrooms on. The acacia, however, bears hollow thorns, and each leaflet produces honey in a crater-formed gland at its base, and a small sweet pear-shaped body at the tip. In consequence, it is inhabited by myriads of a small ant which nests in the hollow thorns, and thus finds meat, drink, and lodgment all provided for it. These ants are continually roaming all over the plant, and make a most effectual bodyguard, not only driving off the leaf-cutting ants, but even, in Mr Belt's opinion, rendering the leaves less liable to be eaten by herbivorous animals. Writing to Fritz Müller on this subject, the late Charles Darwin expressed his entire approval of Mr Belt's view.

A sort of sympathy between certain plants has long been observed to exist, just as though one loved the shadow or company of the other. But it is highly probable this association is based upon mutual interests. Beside some streams, the purple loosestrife constantly adorns the vicinity of the willow. Other plants, on the contrary, seem to have an aversion one to the other, and if this apparent dislike be interfered with by compulsory association, such plants languish or die. The flax-plant, for instance, seems to have an invincible dislike to the scabious. Most likely the roots of one plant emit products favourable to some and noxious to other species. The old Italian botanist Matthioli, observing some curious sympathies in plant-life, termed the phenomena, 'the friendship of plants.' In his work, he says there is so much affection between the reed and the asparagus that if we plant them together both will prosper marvellously. German agriculturists have learned to make profitable use of these plant affinities.

A remarkable observation made during recent years has attracted the attention of physiological

botanists in France and Germany. It is the fact that a considerable number of forest trees do not draw their nourishment directly from the soil, but through the medium of an investing layer of fungus—mycelium. The botanist B. Frank states that all our native oaks, chestnuts, beeches, hornbeams, and hazels are provided with a dense covering of this mycorrhiza, organically associated in growth with the root, and completely enveloping it, even to the growing point.

BOLSOVER BROTHERS.

IN FOUR CHAPTERS.

CHAPTER III.

ABOUT half-past eight next morning the housekeeper made her appearance at the Cottage and let herself in by means of latchkey number three. She had no fear of being caught in what she was about to do, Mr James having intimated that he should not arrive before mid-day. Having shut the door and wiped her shoes carefully on the mat, she went at once up-stairs. As she had expected, she found the door of Mr Bolsover's room locked and the key taken away. But this by no means disconcerted Mrs Mims. Going to her own room, she took out the key from the lock, and inserted it without hesitation into the lock of Mr Bolsover's room; for the housekeeper had not been many days at the Cottage before she discovered that the locks of all the up-stairs rooms were of one pattern, and that the key of any one door would open the other doors. From this it may perhaps be inferred that Mrs Mims was not quite the stolid, wooden-headed person she was commonly credited with being.

She turned the key in the lock, drew a long breath, opened the door, and went slowly in. She was not in the room more than two minutes at most. When she came out she was very white and scared-looking, and her hands shook so much and were so nerveless that it was all she could do to relock the door. After taking back the key, she went down-stairs, her face more dazed and expressionless, and more like the carved figure-head of a ship than perhaps it had ever looked before. She sat down on one of the lower stairs to recover herself in some measure before leaving the Cottage.

To all appearance she was exactly the same woman that she always was when, in answer to her knock, Mr James opened the door to her about half-past twelve.

'I need not detain you more than a few minutes, Mrs Mims,' he said. 'As I told you yesterday, the body will be fetched away some time after dark this evening for conveyance to London. I should like you to be in attendance about eleven o'clock to-morrow, when the landlord's agent will be here, to whom, after he has satisfied himself that the fittings and furniture are all in proper order, possession of the Cottage will be given up.—You have told me already that my brother paid ready-money for everything, and that there are no bills owing, so that when I have settled with you and the doctor, everything will be cleared off. I shall remain here for an hour or two to-day, having some letters to write.'

Mrs Mims being thus dismissed for the day, called to mind that she had a long-standing invitation to go and take tea with her particular friend, Mrs Baylis. As it happened, Mrs Baylis lived in the street which led direct to the railway station; thus it fell out that Mrs Mims, while leisurely sipping her tea behind the open-work curtains of her friend's window, had a view of Mr James posting along at double-quick time, evidently bent on catching the four-thirty train.

Daylight was fading into dusk when Mrs Mims found herself once more at Laburnum Cottage. As before, she let herself in with her private key. On this occasion she did not go up-stairs, but having shut the door behind her, she produced from some part of her dress a couple of pins, one of which, with the help of her thimble, she fixed firmly in the jamb of the door; and the other one, in a line with the first, into the door itself, leaving a space of about a couple of feet between the two, and a space of about three-quarters of a yard between them and the floor. Then from one pin to the other she stretched a piece of ordinary sewing-cotton and left it there. When she had brought this singular proceeding to an end, she stood for a minute or two and regarded her handiwork with much complacency, rubbing her elbows and purring softly to herself as an ancient tabby might have done. Then she let herself out by way of the door which opened on the back garden, and having locked it behind her, took away the key. As already remarked, the Cottage was in a lonely part of the suburbs, and at that hour of the evening there was not a creature anywhere about, so that when Mrs Mims forced her way through the low straggling hedge which divided the garden from the fields beyond it, she had little fear of being seen.

At half-past seven next morning the housekeeper made her way back into the Cottage by the way she had quitted it the night before. She chuckled to herself with a sort of uncanny glee when, on examining the front door, she found the two pins and the thread exactly as she had left them. It was clear that no one had obtained access to the Cottage by way of the front door between the time of her leaving it overnight and her visit this morning. Having removed the pins and thread and made the back door safe, she let herself out by the front as usual.

She was there at the time appointed to meet Mr James, who had brought the landlord's agent with him. Half an hour sufficed for the agent to check over the furniture, linen, &c., with the inventory in his possession, and to satisfy himself that the property had suffered no deterioration beyond ordinary wear and tear at the hands of its recent tenant. While this was being done, Mr James called the housekeeper into the parlour and proceeded to pay her what small amount of wages was due to her, to which he added a gift of two sovereigns, 'as a little recognition,' he said, 'of the faithful and conscientious way in which you did your duty to my poor brother.'

Mrs Mims was profuse in courtesies and thanks. Then she ventured to say: 'I suppose the undertaking people came last night, sir?'

'Why, of course they did,' he answered with unmistakable surprise. 'If they hadn't done so,

how should I be able to give up the key this morning?'

After this, the housekeeper felt there was nothing left her to do but bid Mr James a respectful good-morning and get out of the room as quickly as possible. Five minutes later she bade farewell to Laburnum Cottage.

Mr James Bolsover, having settled with the agent and given up the keys of the Cottage to him, followed Mrs Mims's example. At the corner of the main road he was joined by Mr Gazebrooke, who was smoking a cigar, and seemed to have been waiting for him. Together the two proceeded to the house of Dr Lindley.

He had evidently been expecting them, and had got through his morning round of visits earlier than usual. He looked pale and worn, as if from want of sleep: his manner was nervous and flurried.

'I presume the little document is ready?' said Mr Gazebrooke as soon as the three men were seated in Walter's sitting-room.

'Yes, here it is, together with a duplicate,' answered the latter as he took a couple of slips of paper out of his desk and handed them across the table.

Mr Gazebrooke having carefully read the papers, passed them to Mr James, who accorded them an equal amount of attention. One was a certificate of the death of Evan Bolsover, drawn up in accordance with the prescribed formula in such cases and signed by Walter Lindley; the other purported to be, and was, an exact copy of the original. The cause of death was put down as being congestion of the lungs.

'This ought to fix 'em—hey?' said Mr James with a laugh directed at his friend, as he put the two documents carefully away. Mr Gazebrooke merely smiled. From his pocket-book he was extracting the long blue slip of paper which we have seen before. 'Exchange is no robbery,' he said with a significant nod as he tossed the paper over to Walter. 'You will always find Septimus Gazebrooke a man of his word.'

The young doctor gave a great sigh of relief—a sigh that was almost a sob—as his fingers closed over the paper. There was a fire burning in the grate. Taking the paper between his thumb and finger, he lighted it at the bars and held it till it had burnt itself out. What a terrible load was lifted off his mind as he watched the gray ashes flutter up the chimney, no one but himself could have told. But alas! he had only succeeded in throwing off one incubus to find that he had taken on himself the burden of another.

In one of the offices of the Heron Life and Fire Insurance Company, Lothbury, London, sat two middle-aged gentlemen, one of whom was Mr Bysouth, the chairman of the Company, the other being Mr Smiley, the secretary.

Mr Bysouth had not long held the position of chairman, and in his anxiety to acquire a more thorough knowledge of the details with which he was expected to deal, he was in the habit, once or twice a week, of spending a quiet hour with the secretary, an old and experienced official, who had all the ramifications of the Company's business at his fingers' ends. By these means Mr Bysouth was enabled to get

himself posted up in readiness for the Board meetings, so that whatever questions might be brought forward at such times, he was pretty sure to have some acquaintance with them beforehand. It is on one of these semi-official occasions that we make the acquaintance of the two gentlemen.

'That matter being so far disposed of,' said Mr Smiley as he pushed a batch of papers on one side, 'I will now proceed to lay before you the particulars of a very singular and complicated case, as to which I must admit that I am more puzzled than I have been with any case that has come before me for some years past.' As he spoke he took another batch of tape-tied papers from the basket by his side and placed them on the table in front of him.

'On the 5th of last October,' the secretary resumed—'that is to say about seven months ago—we received a proposal from a certain Mr Evan Bolsover, at that time residing at Fairfax Lodge, Fulham, for a policy of insurance on his own life for the sum of five thousand pounds. The proposal went through the routine usual in such cases. Mr Bolsover was examined, and passed by both the Company's doctors, whose reports were highly favourable. As a consequence, his proposal was accepted; his policy was made out in due course, and half a year's premium was paid by him in advance. About three months later, we were advised by Mr Bolsover that he had changed his address to Laburnum Cottage, Medbury Royal. Nothing further is heard from him; but about the middle of March we receive a notification of his death; and a little later the authenticated documents demanded by us in such cases are duly sent in, from which we learn that Mr James Bolsover, a brother of the deceased, is appointed sole heir and legatee. So far everything has run in its ordinary groove, and although it is somewhat unusual for a fine healthy man in the prime of life, such as the insurer is represented as having been, to die so shortly after having effected a policy for so large an amount, still it is within our experience that such things have happened before, and that circumstance in itself would have aroused no suspicion in our minds. So far, so good.

'Our next step, which is one we nearly always take where a heavy policy is in question, is to employ one of our most trusted subordinates to make certain private inquiries, with the view of satisfying ourselves that we are not being made the victims of fraud in any of the numerous disguises it occasionally assumes in such cases. Our Mr Lomax was the person in the present instance to whom this delicate task was entrusted; and I have before me the two Reports in which are summarised the results of his inquiry. With your permission, Mr Bysouth, I will now lay before you certain salient points of the Reports in question, as to which I purpose taking the opinion of the Board at their meeting on Thursday next.'

Mr Smiley having untied the papers in front of him, and replaced his spectacles more firmly on his nose, took up Mr Lomax's Report marked 'No. 1.'

'The first person upon whom our agent called,' resumed the secretary, 'was the medical prac-

titioner who attended Mr Bolsover during his last illness. Of this person Mr Lomax writes as follows: "Dr Lindley is a young man, whose practice in Medbury only extends over a period of something like a couple of years. The moment I introduced myself and stated the object of my visit, the colour died out of his face, a strange frightened look came into his eyes, and for a few moments he was evidently powerless to utter a word. I need scarcely say that my suspicions were at once on the alert; but I am bound to admit that when once he had regained his composure, he answered all my questions in a clear and straightforward manner. His attendance on Mr Bolsover had extended over a period of eight days. No other medical man had been called in. Mr Bolsover's illness had begun with a severe cold, which had quickly developed into congestion of the lungs. The patient grew worse rapidly; and on the third day, at Dr Lindley's suggestion, a trained nurse was obtained from one of the London hospitals. On the seventh day the illness took an unfavourable turn, and on the eighth day the patient died. The nurse and a certain Mr Gazebrooke, a friend of the deceased, whom the doctor had seen there a few days previously, appear to have been the only persons present at the last. Dr Lindley was sent for hurriedly; but by the time he arrived all was over. Except that the end came rather suddenly, there would appear to have been nothing out of the ordinary way in the course taken by the illness. Finally, Dr Lindley assured me that he had made a careful autopsy of the body, and that there was not the slightest reason to suspect the existence of any foul-play. As regards the nurse, it appears that her name was Goodson, and that she was sent by Mr Gazebrooke. Beyond that, Dr Lindley could supply no information about her." So far the Report.

'Our agent's next call was upon Mrs Mims, a middle-aged woman, who had acted as housekeeper to Mr Bolsover, and was indeed the sole domestic employed at Laburnum Cottage. Mr Lomax describes her as being short-sighted and partially deaf, and with a mind which, to use his own phrase, "seems to be belated and wandering in a perpetual fog. How such a woman," he goes on to say, "could contrive to fulfil the duties of housekeeper with any satisfaction to her employer, is more than I can imagine." It was not much that this worthy person had to tell. She had entered the service of Mr Bolsover on the 12th of January. Her employer was a stranger to Medbury, who had taken Laburnum Cottage ready furnished—a small seven-roomed house in the outskirts of the town. Mr Bolsover went away by train every morning, presumably to London, returning in the evening, generally at rather a late hour. Now and then his friend Mr Gazebrooke returned with him and slept at the Cottage. The information elicited from Mrs Mims as to Mr Bolsover's illness and death threw no fresh light on the subject. She saw her master several times in the course of his illness; and even after the nurse's arrival she sat in his room more than once while the latter took a little rest. As a matter of course, the nurse was an absolute stranger to her. Mrs Mims did not see her master after his demise, the room in which the body lay being kept

locked, by order of Mr James Bolsover, who arrived on the scene on the morning of the day following that of his brother's death. It was on Tuesday that Mr Bolsover died, and it was in the course of Thursday night that the body was taken away by the undertaker sent by Mr James Bolsover, with the avowed intention of having it removed to London for interment. To this transaction Mrs Mims was unable to depose as an eye-witness, she having been dismissed for the time being, and the Cottage shut up and the key taken away by Mr James. Next forenoon, the housekeeper, the landlord's agent, and Mr James, met by appointment at the Cottage. The woman was paid her wages; the agent was paid whatever rent might be due, and took over the keys of the house; and that was the last Mrs Mims saw of Mr James Bolsover.

'Mr Lomax having completed his inquiries so far, and having a spare half-hour before there was a train back to town, bethought himself of ascertaining from the railway people whether on the 17th of March—that is to say, on the Thursday following Mr Bolsover's death—they conveyed a corpse from Medbury to London or elsewhere. It appears that a special book is kept by the Railway Company for the registration of all such transactions. On this book being now referred to, it was found that the last entry in it bore date a fortnight anterior to that of Mr Bolsover's death. It was clear that the dead man's last journey from Medbury had not been by rail; indeed, Mr Lomax hardly expected to find that it had been. Medbury is but a dozen miles from London; and if the coffin and hearse were sent down by road, they would be nearly sure to go back by the same way. But how prove that such was the case? Mr Lomax's suspicions, excited in the first instance by Dr Lindley's strange demeanour at the announcement of his errand, had not yet been thoroughly allayed, and he made up his mind to probe the matter still farther. Accordingly, instead of returning to town by train, he hired a fly at one of the hotels and journeyed back by road. About half-way between Medbury and London he came to a toll-bar, which was precisely what he had hoped to do, although the greater number of them are abolished nowadays. His object was to make the same inquiry at the tollgate as he had made at the railway station. The result was that he was positively assured both by the gatekeeper and his son that no hearse had passed through the gate, going either up or down the road, on or about the date in question. The problem, therefore, that now presented itself was: by what route, or by what mode of conveyance, was the body of Mr Evan Bolsover removed to London? for that it was so removed and interred at the Lowfield Cemetery is proved by the Certificate of Burial forwarded to us among other documents by the brother of the deceased. With this question still unanswered, Mr Lomax concludes his Report No. 1.'

Mr Bysouth, who was a reticent man both by habit and inclination, had simply interjected an occasional 'Just so,' or 'I quite follow you,' but had not interrupted the secretary by as much as a single question. All he now said was: 'You have certainly interested me sufficiently in your first Report to make me desirous of hearing the second.'

Mr Smiley took up Report No. 2. 'I need scarcely tell you, sir,' he resumed, 'that after a careful perusal of Mr Lomax's first Report, I felt far from satisfied with the case as it then stood. Certain features of it seemed to me by no means free from suspicion, and I was far from clear in my mind that an attempt was not being made to victimise the Company by means of a very ingenious system of fraud. As a consequence, I requested Mr Lomax to make certain further inquiries, the results of which are set forth in this document, which I will now proceed to summarise for you as briefly as possible.

'Mr Lomax's next step was to satisfy himself that the certificate sent into the office was a *bond fide* copy of the entry in the Register of Burials at the Lowfield Cemetery. After that, he went in search of the head sexton, from whom, with the aid of a small private register kept by the latter, he obtained the address of the undertakers who had conducted the funeral of the Mr Evan Bolsover. An hour later, a cab put Mr Lomax down at the door of the undertakers in question—Messrs Vibert and Sons of Conduit Walk, Barnsbury. I will now quote from the Report. "Messrs Vibert and Sons had been instructed in the ordinary course of business to arrange for a funeral from No. 38 Persimmon Street, only a little distance away (which, it may be remembered, is the address given us by Mr James Bolsover in his various communications with this office). At the same time they were told that no coffin would be required, the body having been removed from the country to London for burial. The funeral took place in due course. Only two mourners followed the body, one of whom was understood to be a brother of deceased. So far my second investigation had resulted in nothing positive; still, it struck me as singular that a different undertaker should have been called in to conduct the funeral from the one to whom the conveyance of the body from Medbury had been entrusted; and Mr Vibert, with whom I talked the point over, agreed with me, that, if the first undertaker were a London man, such a transaction would constitute a singular deviation from the ordinary practice in such cases. But might he not have been a Medbury man? Therein lay a possibility which had not suggested itself to me before."

'At this juncture, Mr Lomax called in the aid of Strumley, a private inquiry agent, who on more than one occasion has proved himself of value to the Company. Now I come to the Report again. "Strumley, taking Persimmon Street as his central point, and working in a gradually widening circle, was not long in lighting on an undertaker in a small way of business who stated that at ten o'clock on the evening of March 18th his men delivered, at No. 38 Persimmon Street, a polished oak coffin made to order. When the order was given, the undertaker was told that he would not be required to conduct the funeral, the person for whom the coffin was intended having died at a remote country village, where arrangements had been made to bury him, but where it had been found impossible to obtain the handsome brass-handled article he was now requested to supply. He brought both his books and the evidence of his men to prove that it was on the evening of the

18th—not of the 17th, on which date the body was said to have been removed from Medbury—that the coffin was delivered at No. 38 Persimmon Street.”

CRIMPS IN AMERICAN PORTS.

CRIMPS are men who gain a livelihood by preying upon the scanty earnings of merchant seamen with or without the connivance of their superiors. They are not the most pleasant people for an unarmed stranger to meet with, in some sequestered spot, after nightfall. The British Board of Trade has compelled the members of this evil fraternity to seek an asylum under other skies; but they still flourish in all the more frequented seaports of the United States. San Francisco has attained an unenviable notoriety for the aggressiveness and assiduity of these parasites, who fatten upon the vices of our seamen. Crimps minister to the depraved desires of mariners, inflame their passions, rob them of their money, and send them to sea with enfeebled constitutions, and a wardrobe the contents of which may be summed up in a few words as a put-on, a take-off, and a go-naked. These crimps are proprietors of infamous boarding-houses for seamen, which cluster thickly along the city front close to the water's edge, and are specially adapted for nefarious practices. The tender mercies of the crimps are more cruel to the seaman than either howling hurricane or savage sea. Crimps devote their entire energies to ships trading to distant lands, as the coasting crews are deaf to their blandishments and will have none of them.

Forty years ago, the 'Queen of the Pacific' was almost a *terra incognita*, with only a mission of monks and a few rude mud-huts forming an outpost of civilisation; but the star of empire has wended its way westward since the tiny brig *Pilgrim*, with R. H. Dana on board, dropped anchor in San Francisco's beautiful bay. A well-built city, defended by forts, now nestles upon a gentle declivity, and faces the rising town of Oakland, that peeps out between the blue-tinted hills on the opposite side of the bay. Wheat was a scarce commodity there in Dana's day; but at the present time rich argosies laden with golden grain set sail for our markets throughout the season; while white-winged coasting craft, peculiar to the States, are constantly arriving or departing, and trim river-steamers dart hither and thither with their gay pilot-houses glittering in the life-giving rays of the sun. Nature assumes her loveliest aspect; and this port would be a veritable elysium to the weather-worn seafarer if it were not cursed by the preponderance of cruel crimps, who are a power for evil in the State.

There is a great demand for ships when the garnered grain awaits shipment to Europe; and no other port—Calcutta excepted—can show such a splendid fleet of merchant-ships gathered together at one time. British iron ships form the large majority, and always obtain a higher rate of freight than the best built wooden ships of the United States. Now is the opportunity for the crimps to recoup themselves for the period when seamen were a drug in the market. They have lured the seamen from their ships, and hold them in durance vile. Captains are eager to fill up the

vacancies caused by desertion; and the crimps combine among themselves to prevent a single seaman from leaving their infamous dens until they are guaranteed a capitation fee varying from twenty to forty dollars, in addition to two or three months' advance of pay for each seaman supplied. This fee has rightly been termed 'blood-money,' inasmuch as it is a veritable pound of flesh paid by the unsophisticated seaman in discharge of his bond. Very frequently a ship is three-fifths of her way homeward before the crew commence to earn a farthing for themselves. The advance-money is paid directly to the crimps; and Jack seldom, if ever, handles the hard cash. At a late meeting of the Chamber of Shipping, Mr William-son said that the whole of the crew of one of his ships deserted, and he was forced to pay to the crimps blood-money amounting in the aggregate to one hundred and fifty pounds sterling, in order to obtain hands when the ship was ready for sea. Mr Chadwick read a letter from a captain stating that each man shipped in lieu of a deserter had cost him nearly forty dollars. These are not solitary exceptions, but examples of the course of procedure adopted by crimps when the demand for seamen exceeds the supply.

How comes it that this state of disorganisation and demoralisation is suffered to exist? Let us imagine, time and space being annihilated for our purpose, that we are approaching the Golden Gate of San Francisco in a vessel, deeply laden with coal, having made the passage round Cape Horn from England in one hundred and fifty days. A pilot boards us from the welcome pilot schooner; the bar is crossed in safety; and as we proceed up the bay towards an anchorage, boats are seen converging upon the ship from all parts of the shore. Each boat contains crimps, whose lips are warm, but whose hearts are as cold as ice, hastening to board the incoming ship. They may not step over the ship's side until the doctor of the port shall have visited and granted us a clean bill of health. As our good ship forges slowly ahead, the crimps keep up with her by gentle rowing, and exchange a running fire of chaff with the sailors, who are amused by their boisterous wit. Presently the health officer shoves off; the horde of ruffians immediately clamber over the rail, and our deck is thronged with some of the vilest specimens of the human race. It is a startling exemplification of the old fable of the wolf and the lamb, with more interesting *dramatis personæ*. Seamen are but feeble folk in a knowledge of worldly wiles, owing to the state of isolation necessary in their profession, and fall an easy prey to the stealers of men.

Almost all crimps have served some time at sea; but agree in practice with George Herbert's theory, that it is better to 'praise the sea, but stay on land.' Hence it is that these men, who, judging by their gallows complexions, are certainly not born to be drowned, know full well that a glass of grog and a savoury snack of fresh fare are irresistible attractions to men who have had neither during a long five months. They treat our crew to ardent liquors, which are freely imbibed; and more experienced crimps produce dainty dishes from hidden receptacles. Jack fears no longer, but begins to feel as exhilarated as a dog set free from his chain; and by the time the anchor brings us up, he imagines himself every

whit as good as his master in this land of good things.

The crimps profess the most intense interest in the welfare of our men, and point out that they can command double the wages, as men are scarce and desertion is never punished. He who wavers is lost. A crimp thrusts a battered boarding-house card into his hand as a warning to other crimps that this man has been appropriated, and having met with success, the tout is at liberty to press his hospitalities upon the distrustful of our crew, who may have heard harsh tales of the crimps, but are reassured by the old tale of 'Codlin's your friend, not Short.' The plausible crimp admits that some of his confrères are rogues; but he could never stoop so low as to rob a seaman. Sails have to be furled; up aloft go the crimps and lay out on the yards to help the seamen they have inveigled by their specious stories. We are powerless to prevent our crew from desertion; and the chief officer, chafing under a sense of his own impotence in this respect, precipitates matters by speaking somewhat brusquely to the now half-inebriated seamen, and we are in a short time left swinging to our anchor with none but officers and boys on board. Even married men can scarcely avoid the importunities of the crimps, although aware that half-pay to their wives will cease immediately they quit the ship without leave. All our seamen cast in their lot with the boarding-masters, and left the ship with five pounds or more unclaimed. Such scenes happen every day in San Francisco.

How fares it afterwards with such misguided men? Taken with their effects to the boarding-houses of their choice, alcoholic liquors are supplied to them without stint, as every house has a bar of its own; and they may consider themselves fortunate if the awakening next morning is not on board a strange ship bound to Europe. They have been put on board of her at nightfall, stupefied with drugged potatoes. It is vain for them to protest that they did not sign the ship's articles; the shipmaster has had to pay for a certain number of men, and he is one of the number with his forged signature in evidence. As a rule, however, such men are too shamefaced and ignorant of the law to raise an objection to the treatment they have received. They have been 'shanghaied,' as it is termed, and accept the inevitable as gracefully as they can.

We once saw twenty men desert from a British man-of-war anchored in San Francisco Bay. It was broad daylight, and the crimps pounced upon the reckless runaways, who found themselves next morning on board the American ship *Puritan*, that lay at anchor close under the stern of their old home, whereon they could read the legend, 'England expects every man to do his duty.' Not one of them knew how he had been kidnapped, nor for what unkind fate he was reserved. Shades of the Pilgrim Fathers! This ship belied her name, and proved a floating pandemonium. Her second officer was of herculean frame, unable to read or write, and was well known for his brutality to men under him. How the poor fellows suffered, few would believe. The blow was as quick as the word; and many a time they wished themselves back under the cross of St George, notwithstanding the restrictions under which they previously groaned. These were as

nothing in the balance when weighed against the cruel treatment to which they were subject, and against which there was no appeal. The officer referred to was a foreigner. Educated Americans are kind to their men.

Crimps can always muster idle vagabonds to present themselves at the shipping office and sign a ship's articles in the names of men who lie drugged in the boarding-houses ready for transference to the ship waiting off the wharf. The first few hours after leaving San Francisco can never be forgotten. One voyage, the *St Lawrence* was towed to sea with every seaman in the fore-castle unfit for duty. A breeze began to blow briskly, and sail had to be reduced. The chief officer looked into the fore-castle, and found his crew literally floating about inside on their chests. A head-sea, coming in through the open hawsepipes, was filling the place; but not a man was capable of helping himself. Sometimes delirium tremens supervenes, and as a rule it is some days before the traces of drink are effaced.

When opportunity offers, our shipmasters in some cases are as bad as the crimps. Wheat is kept back by the farmers; ships lie idly at their moorings; and the supply of seamen is in excess of the demand. At such a time captains demand, and obtain, a bonus from the crimps, whose boarders are eating their heads off in crowded houses. Our consul, Mr Booker, in 1874 addressed an appeal to the masters in port, imploring them to cease this practice, so contrary to the interests of both owners and seamen, pointing out that the action was illegal, and stating that he would uphold the law for the protection of seamen. We have known cases in which the master of a ship has been paid from ten to fifteen dollars by the crimps for each seaman he has taken off their hands in the slack season—a nice little nest-egg for a badly paid shipmaster, and Poor Jack pays in either case. Hence it will be seen that it is not easy to know the seamen's friends at ports abroad. Masters are able sometimes, as we have shown, to make money on the men when shipped; and it is easy to see that a claim can always be lodged against the money of a deserter, who is not present to deny his indebtedness, so that it is possible for profit to accrue to a shipmaster on both sides of the account. This is one reason why strenuous efforts are not made more often to escape from the thralldom of the crimp.

Curious tales are told of the makeshifts supplied by crimps as able seamen. Greenhorns from mining-camps and log-huts have strayed into the crimp's domains and been shipped on board some outward-bounder, much to the disgust of both greenhorns and sailors, as the latter find the landsmen but an encumbrance. Dead men are said to have been smuggled on board, and received by the mates as drunkards.

Not every seaman who ships in San Francisco is shanghaied even at the busiest times. Those who sign the articles of a British ship must appear before our consul, and the articles are carefully read over to them before they sign their names. The men, however, are in duress. The eye of the crimp is not far off, and the seaman is unable to cope with the forces arrayed against him. We have heard several ships' articles read over to the crews in the consul's office by the present vice-consul, than whom the sailor can have no truer or

more impartial friend; but not a dissentient voice was to be heard; yet one-half of the insubordination of seamen and cruelty of officers may be traced to the fact that men who know they have no money to take at the end of the voyage, grow careless in the performance of their duties; while officers are angered by the ignorance of the lubbers who are shipped as seamen.

Portland, Oregon, is as bad as San Francisco. The master of the *Andora*, lately arrived from that port, was summoned at Hull for wages said to be due to one of his crew. It came out in evidence that it was simply impossible to man a ship without the aid of the crimps. Two hundred and fifty pounds sterling was paid as blood-money for thirteen men, together with eight pounds advanced to be deducted from each seaman's earnings on arrival at Hull. The complainant was a backwoodsman, and the judge decided that two pounds per month was as much as he was worth. One of the Portland crimps murdered a confre in San Francisco, but escaped with six months' hard labour, owing to some quibble of American law. Probably it was thought that it was a pity the crimps did not act in a similar way to the Kilkenny cats, and thus rid the State of the whole gang.

Crimping is rife at the present time; and so long as it pays shipmasters better to get rid of their crews and to ship new men, we see no way out of the difficulty. Some alteration, however, might be effected if pamphlets, setting forth the dark doings of crimps in American ports, with full details of the bodily suffering and pecuniary loss to seamen consequent on desertion, were handed to every sailor, by the officials of the Board of Trade, when signing articles to proceed to America. These pamphlets might be made interesting by containing a description by a resident of the principal places worth visiting in the respective ports. Better and fairer than all would be to pay off the seaman, if he wish it, on arrival at any of these ports, if practicable. Our consul at San Francisco has done his best for the seaman as well as for the owner, and several presentments have been made to our Foreign Office, but no change has resulted.

THE KING OF CONJURERS.

In the year 1843, a French nobleman, the Comte de l'Escapulier, was one day passing through a street leading out of the Place Royale, in which his residence was situated. His attention was attracted by a clock, labelled a *pendule de précision*, which was exposed for sale in the window of a watchmaker's shop. The mechanism of the clock was peculiar; and the Count admired and purchased it. At the same time he entered into conversation with the ingenious inventor, whom he quickly discovered to be gifted with remarkable talent in his art. In this way Robert Houdin, destined to be subsequently the greatest conjurer of his day, made the acquaintance of the patron by whose assistance he was enabled to realise his cherished ambition of appearing before the public as a prestidigitateur.

The unskilful manner in which the professors of

the art of sleight-of-hand had hitherto executed the tricks they exhibited, and the clumsy apparatus they made use of, had led him to believe that it would be in his power to improve considerably upon their performances. In the intervals of leisure which his narrow circle of clientage afforded him, he had occupied himself in constructing various mechanical appliances that would help him in the calling he was desirous of pursuing, should the opportunity present itself of his doing so; but hitherto the want of capital had prevented his putting his project into execution.

The Count, who had some knowledge of the mechanical arts, and took a warm interest in their development, was much pleased with several of the inventions shown him; and later on, when his acquaintance with Houdin had become more intimate, he offered him a loan of ten thousand francs for an indefinite period, in order that he might have the means of embarking in his new enterprise. This generous proposal Houdin felt it to be his duty to decline, since in the event of the experiment proving unsuccessful, he saw no reasonable prospect of his ever being in a position to repay the money. The Count was hurt at the refusal of his proffered assistance, and left the shop in anger. A few days afterwards, however, the Count again visited Houdin, to whom he said: 'My friend, although you are unwilling to place yourself under an obligation to me, I am not too proud to solicit a favour at your hands. The circumstances are these: for months past I have been robbed by some of my servants. I have discharged several whom I suspected, and replaced them by others, in the hope of getting rid of the thief; but to no purpose, for the robberies still continue. I come, therefore, to you to beg that you will afford me your help in discovering the culprit.'

Houdin replied with a smile: 'Why, Monsieur le Comte, this is an affair for Vidoq rather than for me. I cannot pretend to any particular skill in a business of this kind.—In what way do you suggest that my services can be made available?'

'As a mechanician,' was the response. 'For certain reasons, I am desirous of not making the matter public, or, long before this, I should have put it into the hands of the police. Can you not invent some piece of mechanism that, attached to the door of the safe in which I keep my valuables, will lead to the detection of the delinquent?'

This hint sufficed for Houdin. An idea struck him, and he demanded a delay of only twenty-four hours in which to construct an apparatus that should effect the desired end. On the evening of the following day he presented himself at the Count's house, carrying with him the contrivance he had invented. The safe stood in a small room which communicated with the Count's bedchamber. The door of the safe was kept invariably locked; the key of it never left the owner's possession; and it was obvious that the

thief had provided himself with a false key, since there was no appearance of force having been employed in picking the lock. Houdin, having pointed out this fact to the Count, proceeded to attach his apparatus to the inner side of the door of the safe. In doing this, the right hand of Houdin was protected by a stuffed glove, similar to that used by boxers. This circumstance excited the curiosity of the Count, and he demanded why the precaution was taken.

'Let it be assumed,' was the reply, 'that the robber has opened the safe. Well, by means of my contrivance, directly he has turned the key in the lock and pulled the door open, even a single inch, a pistol-shot is fired. At the same time on the back of the hand of the burglar is indelibly stamped the word *voleur*. You perceive, therefore, the necessity of my wearing a glove.'

'Explain the working of the machinery.'

'The pistol-shot is simply to give you warning of what has occurred in whatsoever part of the house you may be at the time. But scarcely will the door have been opened, when a claw mounted on a wire and working with a spring will fly out, and clutch the hand of the individual who has inserted the key in the lock. The claw is a tattooing machine, and the short sharp needles of which it is composed are so arranged as to form the word *voleur*, as already stated. These needles pass through a pad impregnated with nitrate of silver, which injects itself into the wound and leaves for life ineffaceable marks.'

The Count's countenance assumed a serious expression. 'We have no right,' he said gravely, 'to brand a man in this way.* That is the prerogative alone of the law. Besides, even granted that we were permitted to do this, would it be consistent with the dictates of humanity to stamp upon the flesh of a fellow-being a cruel and criminating mutilation, which must of necessity for ever rank him with the enemies of society? The man who has robbed me may not be a hardened offender: he may be young, and his principles not yet so fixed as to enable him to resist the temptations that life in Paris affords.'

Houdin recognised the justice of this reasoning. He also shrewdly guessed the reason why the Count had evinced an insuperable reluctance to invoke the aid of the law in the matter. He had sons who were young men, and possibly he entertained some fears of finding in the culprit a member of his own family.

'I admit,' said Houdin, 'the force of your arguments. It will only require a few hours to effect such alterations in the instrument as will remove your objections to its employment in its present form.'

The apparatus was consequently so modified that the claw, instead of tattooing, gave only a cat-like scratch, which would soon heal and leave behind no branding scar. Under these circumstances, the Count no longer saw any reason why the instrument should not be used; and it was at once attached to the safe.

* At that period the *forçats* at the galleys at Toulon and elsewhere were branded on the shoulder with the letters T. F. (the initials of the words *Travaux Forcés*); but the practice has for many years past been discontinued.

In the course of the next few days the Count instructed his steward to draw from his bankers considerable sums of money in gold, which were deposited in the safe. In this way it was anticipated that the cupidity of the thief might receive an additional stimulus. For upwards of a fortnight, however, no attempt was made upon the strong-box; and the Count began to fear that the precautions he had taken had come to the knowledge of the members of his household. But in this he was mistaken. On the sixteenth day a pistol-shot was fired in the room where the safe stood. The Count, who at the time was in the drawing-room, rushed up-stairs to the apartment; there he found his steward, pale and agitated, endeavouring to conceal his right hand by placing it behind his back.

'What is the matter?' demanded the Count.

'A few moments ago,' was the reply, 'I came in, under the impression that I should find you here, as I wanted to speak with you on business. But I was surprised to see a man attempting to force open the door of the safe. A pistol went off—how fired, I know not—and the burglar, alarmed by my presence, jumped out of the window on to the piazza and descended the steps into the garden, whence he made his escape through the little back gate.'

The Count, without saying a single word, went into the garden, and discovered the gate locked and the key in the inside—a palpable proof of the falsity of the steward's story—then, returning to the room, he insisted upon the man's hand being shown him, which proved to be bleeding freely from the scratches it had received. The case, therefore, was perfectly clear.

'For how long a period have you been robbing me?' asked the Count quietly.

'About eighteen months,' was the cool response of the culprit, who by this time had recovered his presence of mind, and, seeing that the game was up, resolved to make a clean breast of the matter.

'And what is the total amount of the money you have stolen from me during that period?' was the next question.

'A little over fifteen thousand francs.'

'What have you done with this sum?'

'I have invested it in government securities; the bonds representing them I have in my desk at home.'

On condition of the steward's delivering up the bonds and signing a paper admitting his guilt, the Count—out of consideration for the offender's family—contented himself with discharging his dishonest servant. The money that had been recovered, De l'Escalopier forced upon Houdin as a loan, to be repaid only at his convenience.

Possessed of this capital, Houdin took a small hall in the Palais Royal and fitted it with considerable taste. The stage was set so as to represent a drawing-room, in white and gold, of the style of Louis XV. The little auditorium would hold only two hundred persons; but the prices were rather high, the front seats being five francs each, and no place was obtainable for less than forty sous. The entertainment was from the commencement highly popular with the Parisians; and the profits realised by Houdin from his venture were so large that in less than a year

he was enabled to repay his kind patron the whole of his loan.

Houdin acquired a comfortable competence by the exercise of his art; and he built a handsome villa at Saint-Gervais, near Blois. When he had retired from business, he amused himself by introducing various curious inventions into his place and the grounds attached to it. The garden gate was situated some four hundred yards from the house. A visitor had only to raise a diminutive brass knocker, and let it fall upon the forehead of a fantastic face—making but a faint sound—when a large bell was set in motion in the villa. At the same time the gate swung open automatically, the plate, bearing the name 'Robert Houdin,' disappeared, and another took its place, on which was engraved the word 'Entrez.' When the postman delivered the letters he had brought, he was instructed to drop them through a slit in the gate into the receptacle provided for this purpose. The box, directly this was done, started with its own accord on its journey to the front door of the house by means of a miniature elevated railway. Houdin invented, too, an ingenious contrivance by which, while lying in bed, he could feed his horse in a stable fifty yards from the villa; for, on touching a small button, there was put in motion an apparatus that caused the exact portion of oats required for the animal's meal to fall into the manger from the granary above. By another curious piece of mechanism, a little bench, that stood beside a ravine in a remote part of the grounds, was so constructed that immediately any person sat down upon it, the machine automatically traversed a narrow bridge that spanned the gorge, and having deposited its occupant on the other side, the bench returned to its original position.

Since Houdin's time, the feats of legerdemain he performed have in some few instances been surpassed by those of his successors in the art. But, conceding this, it is due to his memory to state that he was the first individual pursuing his calling who recognised and utilised the resources that modern discoveries in science had placed at the disposal of the juggler; and some of the most curious tricks exhibited by Houdin were executed by the aid of electricity. It was therefore not without justice that the countrymen of the ingenious Frenchman bestowed upon him the title of 'King of Conjurers.'

RUB LIGHTLY.

A STORY is told of a dignitary of the Church who somewhat astonished an audience of young clergymen by taking the above words as the text of an address, in which he impressed upon his hearers the importance of tact in dealing with their lay brethren. Speaking generally, it may be said that in every walk of life delicate treatment and gentle handling are often the secret of success in dealing both with persons and things. The great gift of tact, so difficult to define, so easy to appreciate and admire, is nothing more than the art which enables its possessors to 'rub lightly' in all the relations of life. The instinct which helps us to understand characters widely different, which gives us a quick perception of the susceptibilities and peculiarities of others, is essential

to all who aspire to deal successfully with their fellow-men.

Even in the most commonplace duties of everyday life the art of rubbing lightly will often enable us to overcome difficulties and obstacles which have resisted all rougher methods. The servant who possesses a 'light hand' is indeed 'a treasure' in the eyes of her mistress, and will succeed in many little domestic duties where clumsy fingers would utterly fail.

Though of most importance, and seen in its highest form in the world at large, there is ample scope for the exercise of tact in the narrower circle of home-life and social gatherings. And here it may be observed that this natural instinct and insight into character, connected as it is with the finer feelings of our nature, is seen more commonly and in a higher degree among women than among men. Who does not admire the ready tact which enables a popular hostess to make a mixed party 'go off,' or, in other words, to harmonise the somewhat discordant elements of a miscellaneous assemblage. 'What can equal woman's tact,' says Oliver Wendell Holmes; 'her delicacy, her subtlety of apprehension, her quickness to feel the changes of temperature, as the warm and cool currents of talk blow by turns?'

If we consider the importance of tact in the wider relations of life, we shall find that those who can rub lightly achieve a large measure of success in dealing with others.

Perhaps the value of tact will be most readily and most commonly recognised in the region of diplomacy. And while it may be said to attain its highest development in the successful ambassador who carries on negotiations of the most delicate nature, on which the issues of peace or war may depend, it is of almost equal importance to the great party leader, the popular bishop, the eminent physician, the successful head-master. One and all of these in their different spheres carry out more or less unconsciously the principle of rubbing lightly in their intercourse with their fellow-men. If it be too much to say that 'tact is success' in life, it may at any rate be safely asserted that to those whose work consists mainly in managing or influencing others, the art of rubbing lightly is a most important factor in the attainment of popularity.

AFTER THE STORM.

THE storm has passed; yet still a troubled moaning,
A strange impassioned sob, comes fitfully.
Dost thou repent, and is there no atoning
For deeds of darkness, O thou wayward sea?

Too late this show of sorrow and contrition
For happy homes by thee made desolate!
Ask those for absolution and remission
Who look abroad across thy waves, and wait.

Long shall they wait, and, anguish-stricken, wonder
What keeps the steps of those they love so well—
Who lie beneath thy deep incessant thunder,
Cradled for ever 'mid thy surge and swell.

APPLE LORE.

THE apple has always been one of the most popular of fruits. Poets have sung its praises and prose-writers have dwelt upon its virtues. Naturally, there has gathered round it a not inconsiderable body of folklore, and in connection with its culture are still preserved and maintained customs and practices directly derived from the pagan festivals and sacrifices of old.

It used to be the custom in Devonshire and the other western fruit-producing counties to perform a sacrifice to the apple-tree on Twelfth Night. In the evening the farmer's family and their friends assembled and partook of wheaten cakes, or of toasted bread, dipped in cider. They then went into the orchard, one of the party carrying hot cake or bread and cider, to be offered to the principal tree. The cake was placed on a forked branch, and the cider was thrown over it. While this was being done, the assembled men fired off their muskets, pistols, or any other firearms which they could muster, and the women and children shouted excitedly some such rhyme as the following :

Health to thee, old Apple-tree !
From every bough, give us apples enow,
Hats full, caps full, bushel bushel bags full.

Hurrah ! hurrah !

In Sussex, in the apple-growing districts, a somewhat similar ceremony, so far as regards the chanted or shouted invocation, used to be and perhaps still is performed. It was known as 'worsling'—that is, wassailing the apple-trees, and was generally performed by boys, to whom the farmers always gave pence, as it was considered unlucky to omit the ceremony. Herrick, in his *Hesperides*, thus refers to the superstition and the object for which the ceremony was performed :

Wassail the trees that they may beare
You many a plum and many a peare ;
For more or lesse fruits they will bring,
As you do give them wassailing.

Aubrey the antiquary, writing in 1688, remarks

that he had often seen in Herefordshire, and also in Somerset, on Midsummer Eve, fires burning in the fieldpaths in order to bring a blessing upon the apples and other crops. Grimm says that to this day at a fruit-gathering in Holstein five or six apples are left hanging on each tree, in order that the next year's produce may be plentiful. This is evidently a sacrifice to the god who blessed the crop. All these practices are doubtless remains of the old Roman worship of Ceres.

Pennant, in his *Tour in Scotland*, describes a custom then observed similar to the Devonshire ceremony, and says that the men finished the rite by drinking their master's health with good wishes for the success of future harvests, and eating caraway and other seeds soaked in cider as a reward for their toil in seed-time. 'This,' he says, 'seems to resemble a custom of the ancient Danes, who, in their addresses to their rural deities, emptied, on every invocation, a cup in honour of them.' The delectable brew known as 'lamb's-wool,' which used to be drunk on Twelfth Night and on Michaelmas Eve, was made with ale, sugar, nutmeg, cloves, and other spices, and roasted apples. Each person present took an apple with a spoon, ate it, and then drank the health of the company from the bowl. Herrick says :

Next crown the bowl full
With gentle lamb's-wool ;
Add sugar, nutmeg, and ginger,
With store of ale, too.

The reader will remember Dr Primrose's visit to neighbour Flamborough's on Michaelmas Eve, when the goose and dumplings were fine, and the lamb's-wool, even in the opinion of Mrs Primrose, who was a connoisseur, was excellent.

Another survival and development of ancient superstition is to be found in the widespread use of the apple in divination. In Scotland and in England the apple is a very popular divining medium in love matters. Part of this popularity is probably due to the common notion that the tree of knowledge of good and evil was an

apple-tree. Horace mentions the use of apple-pips in love affairs. A lover would take a pip between the finger and thumb and shoot it up to the ceiling; and if it struck it, his or her wish would be accomplished. Nowadays a maiden tests the fidelity of her beloved by putting a pip in the fire, at the same time pronouncing his name. If the pip bursts with a report, it is a sign that he loves her; but should it burn silently, she is convinced of his want of true affection for her. This is often performed with nuts instead of pips. Gay's *Hobnelia* experiments with the pips by placing one on each cheek, one for Lubberkin, and the other for Boobyelod:

But Boobyelod soon drops upon the ground,
A certain token that his love's unsound;
While Lubberkin sticks firmly to the last.

Gay also mentions the very common amusement of paring an apple without breaking the peel and then throwing the strip over the left shoulder, in order to see the initial letter of the lover's name formed by the shape the paring takes upon the ground. This is often one of the many divinations duly practised on Halloween or All-Saints' Eve. Another way at the same season is for the curious maiden to stand before a looking-glass combing her hair with one hand and eating an apple held in the other; the face of the future husband will then be seen in the glass looking over her left shoulder. Mrs Latham, in her *Sussex Superstitions*, gives another apple charm. Every person present fastens 'an apple on a string, hung and twirled round before a hot fire. The owner of the apple that first falls off is declared to be upon the point of marriage; and as they fall successively, the order in which the rest of the party will attain to matrimonial honours is clearly indicated; single-blessedness being the lot of the one whose apple is the last to drop.'

The 'christening of the apples' is an event looked for by country-folk; but there seems to be considerable diversity of opinion as to the correct date for the 'christening.' To ensure a good crop, the rain ought to fall upon them on St James's Day, say some; on St Peter's Day, say others; while a third party, regardless of the dreadful consequences of rain on such a day, say that St Swithin's is the proper time. In the west, there is a belief that on St Swithin's Day the apples undergo a change; that having been flavourless, they then become fruity and pleasant to the taste and fit for use. 'Apple-drain' is a very common and expressive name for a wasp among the Devonshire peasantry. Peter Pindar, in his *Royal Visit to Exeter*, speaks of 'bullocks stinged by apple-drains.'

The apple appears occasionally in folk-medicine. In Lincolnshire a very common remedy for weak eyes is a poultice made of rotten apples. In the same part of the world, warts are cured by rubbing them nine times with an apple cut into nine pieces; the sections of the fruit are reunited and buried, and as they decay, so it is thought the warts will disappear. The notion that these excrescences can be cured by being rubbed with apple sections, or with a green elder stick or

a bean-shell, if the substance used is buried or left to rot, is found in many parts of the country. An old *Collection of Receipts in Physick and Surgery*, dated 1759, gives the following 'For a blow, or hurt in the eye:' 'Beat the leaves of eyebright with a rotten apple; lay it on the eye as a poultice: repeat it as it grows dry. I think the juice of the eyebright is best.' The euphrasia, or eyebright, was long considered a powerful medicine for all affections of the eye. Milton makes the Archangel Michael purge 'with euphrasy and rue' Adam's visual nerve. An old writer, Lovell, in his *Herball*, 1665, says that 'the ointment of apples softens and supple the roughness of the skin, and heals the chaps of the lips, hands, face, and other parts; also it whitens and smooths the skin, when sunburnt and rough with the north wind.' Mr W. G. Black, in his work on *Folk-Medicine*, mentions a New England charm for ague that had been sent to him by an American correspondent. The patient was to take a string made of woollen yarn, of three colours, and to go by himself to an apple-tree; there he was to tie his left hand loosely with the right to the tree by the string, then to slip his hand out of the knot and run into the house without looking behind him. This is an instance of the very old and general belief that disease can be cured by its transference either to an animal of a lower order or to some stationary object such as a tree.

There used to be a curious custom observed on Easter Sunday at Northmore, near Witney, in Oxfordshire. After evening service, men and women threw quantities of apples into the church-yard; and those persons who had been married during the year had to throw three times as many as any of the rest. After this was done, they all adjourned to the minister's house to eat bread and cheese and drink ale. The minister, it may be noted, was always expected to have the best cheese he could get. Dr Bliss, in his edition of the *Reliquie Hearnianæ*, wherein the custom is mentioned, says that it was still kept up in 1822. What it meant, or whether it be now practised, we know not.

The importance in the fruit-growing counties of a good crop has naturally given rise to many proverbial sayings connected with the apple-tree. In Devonshire the people say:

If good apples you would have,
The leaves must be in the grave.

That is, the trees should be planted after the fall of the leaf. This appears in a slightly different form in Ray's *Proverbs*. A common notion is that if the sun shines through the apple-trees on Christmas Day, there will be a plentiful crop in the ensuing year. Blossom in March is a bad sign.

If the apple-tree blossoms in March,
For barrels of cider you need not sarch.

But if the tree blossom in May, 'you can eat apple dumplings every day.' Or, as another version has it, 'you may eat 'em night and day.' It is considered a very bad omen to see both blossom and fruit at the same time on an apple-tree, this being regarded as a sure sign of death to one of the family before the following spring. Sometimes, however, the prognostication appears

in the form of the following saying, which is so very vague that it need not cause alarm to any one :

A bloom upon the apple-tree when the apples are ripe,
Is a sure termination to somebody's life.

THIS MORTAL COIL.

CHAPTER XLVII.—FORTUNE OF WAR.

AT Monte Carlo, on the other hand, day dawned serene and calm and cloudless. Hugh Massinger rose, unmindful of his far-away Suffolk sandhills, and gazed with a pleasant dreamy feeling out of the window of his luxurious first-floor bedroom. It was a strange outlook. On one side, the ornate and overloaded Parisian architecture of that palace of Circe, plumped down so grotesquely, with its meretricious town-bred airs and graces, among the rugged scenery of the Maritime Alps: on the other side, the inaccessible crags and pinnacles of the Tête-de-Chien, gray and lonely as any mountain side in Scotland or Savoy—the actual terminus of the main range of snow-clad Alps, whose bald peaks topple over sheer three thousand feet into the blue expanse of the Mediterranean, that washes the base of their precipitous bluffs. The contrast was almost ludicrous in its quaint extremes.

He did not wholly approve the desecration. Hugh Massinger's tastes were not all distorted. Dissipation to him was but a small part and fraction of existence. He took it only as the mustard of life—an agreeable condiment to be sparingly partaken of.—The poet's instinct within him had kept alive and fresh his healthy interest in simpler things, in hill and dale, in calm and peaceful country pleasures. After that feverish day of gambling at Monte Carlo, he would dearly have loved to rise early and saunter out alone for a morning walk; to scale before breakfast the ramping cliffs of the Tête-de-Chien, and to reach the mouldering Roman tower of Turbia, that long mounted guard on the narrow path where Gaul and Italy marched together. But that hateful pile of gold and notes between the pillow and the mattress restrained his desire. It would be dangerous to wander among the lonely mountains with so large a sum as that concealed about his person; dangerous to leave it unguarded at the hotel, or to entrust it to the keeping of any casual stranger. 'Cantabit vacuus coram latrone viator,' he murmured to himself half aloud with a sigh of regret, as he turned away his eyes from that glorious semicircle of jagged peaks that bounded his horizon. He must stop at home and take care of his money-bags, like any vulgar cheesemongering millionaire of them all. Down, poet's heart, with your unreasonable aspirations for the lonely mountain heights! Amaryllis and asphodel are not for you. Shoulder your muckrake with a manful smile, and betake you to the Casino where Circe calls, as soon as the great gate swings once more on its grating hinges. You cannot serve two masters. You have chosen Mammon to-day, and him you must worship. No mountain air for your lungs this morning; but the close and crowded atmosphere of the roulette tables. Keep true to your creed for a little while longer: it is all for Elsie's sake! —For Elsie! For Elsie!—He withdrew his head

from the window with a faint flush of shame. Ah, heaven, to think he should think of Elsie in such a connection and at such a moment!

He dressed himself slowly and went down to breakfast. Attentive waiters, expectant of a duly commensurate tip, sniffing *pour-boire* from afar, crowded round for the honour of his distinguished orders. Raffalevsky joined him in the *salle-à-manger* shortly. The Russian was haggard and pale from sleeplessness: dark rings surrounded his glassy black eyes: his face was the face of a boiled codfish. No waiter hurried to receive his commands: all Monte Carlo knew him well already for a heavy loser. Your loser seldom overflows into generous tipping. Hugh beckoned him over to his own table: he would extend to the Russian the easy favour of his profuse hospitality. Raffalevsky seated himself in a sulky humour by the winner's side. He meant to play it out still, he said, to the bitter end. He couldn't afford to lose and leave off; that game was for capitalists. For himself, he speculated—well—on borrowed funds. He must win all back or lose all utterly. In the latter case—a significant gesture completed the sentence. He put up his hand playfully to his right ear and clicked with his tongue, like the click of a revolver barrel. Hugh smiled responsive his most meaning smile. 'Espérons toujours,' he murmured philosophically in his musical voice and perfect accent. No man on earth could ever bear with more philosophical composure than Hugh Massinger the misfortunes of others.

Before he left the breakfast-table that morning, a waiter presented the bill, all deferential politeness. 'I sleep here to-night again,' Hugh observed with a yawn, as he noted attentively the lordly conception of its various items. The waiter bowed a profound bow.—'At Monte Carlo, Monsieur,' he said significantly, 'one pays daily.'—Hugh drew out a handful of gold from his pocket with a laugh and paid at once. But the omen disquieted him. Who wins to-day may lose to-morrow. Clearly the hotel at least had thoroughly learnt that simple lesson.

They filed in among the first at the doors of the Casino. Once started, Hugh played, with scarcely an intermission for food, till the tables closed again. He kept himself up with champagne and sandwiches. That was indeed a glorious day! A wild success attended his hazards. He staked and won; staked and lost; staked and won; staked and lost again. But the winnings by far outbalanced the losses. It went the round of the tables, in frequent whispers, that a young Englishman, a poet by feature, was breaking the bank with his audacious plunging. He plunged again, and again successfully. People crowded up from their own game at neighbouring boards to watch and imitate the too lucky Englishman. 'Give him his head! He's in the vein!' they said. 'A man in the vein should always keep playing.' The young lady with the fine Pennsylvanian twang remarked with accidental plainness of speech that she 'wouldn't object to running a partnership.' Hugh laughed and demurred.—'You might dilute the luck, you know,' he answered good-humouredly. 'But if you'll hand me over a hundred louis, I don't mind putting them on 31 for you.' He did, and they won. The crowd of gamblers

applauded, all hushed, with their usual superstitious awe and veneration. 'He has the run of the numbers,' they said in concert. To gamblers generally, fate is a goddess, a living reality, with capricious likes and dislikes of her own. They are ever ready to back her favourite for the time being; they look upon play as a predestined certainty.

Raffalevsky meanwhile lost and lost with equal persistence. He drank as much champagne as Hugh; but the wine inspired no lucky guesses. When they came to count up their gains and losses at the end of the day, they found it was still a neck-and-neck race, in opposite ways, between them. Hugh had won altogether close on nine thousand pounds. Raffalevsky had lost rather more than eight thousand five hundred.

'Never mind,' Hugh remarked with his inexhaustible buoyancy. 'We're still to the good against his Monegasque Highness. There's a balance of something like five hundred pounds in our joint favour.'

'In other words,' Raffalevsky answered with a grim smile, 'you've won all my money and some other fellow's too. You're the sponge that sucks up all my lifeblood. I've got barely three thousand five hundred left. When that goes'—And he repeated once more the same expressive suicidal pantomime.

That night, Hugh slept at Monte Carlo once more. He had lost all sense of shame and decency now. He sent off a note for two thousand francs to the people at the *pension*, just as a guarantee of good faith—as the newspapers say—and to let them know he was really returning. But he had formed a shadowy plan of his own by this time. He would wait another day at the Casino and go home to San Remo with Warren Relf by the train that reached there at 6.39—the train by which Elsie had said in her note he would be returning.

Why he wished to do so, he hardly with distinctness knew himself. Certainly he did not mean to pick a quarrel; he only knew in a vague sort of way he was going by that train; and until it started, he would keep on playing.

And lose every penny he'd won, perhaps! Why not leave off at once, secure of his eight thousand? Bah! what was eight thousand now to him? He'd win a round twenty before he left off—for Elsie.

So he played next day from morning till night; played, and drank champagne feverishly. Such luck had never been known at the tables. Old players stood by with observant faces and admired his vein. Was ever a system seen like his? Such judgment, they said; such restraint; such coolness!

But inwardly, Hugh was consumed all day by a devouring fire. His excitement at last knew no bounds. He drank champagne by the glassful to keep his nerve up. He had won before nightfall, all told, no less a sum than eleven thousand pounds sterling. What was the miserable remnant of Whitestrand, now, to him! Let Whitestrand sink in the sea for all he cared for it! He had here a veritable mine of wealth. He would go back to San Remo to bury Winifred—and return to heap up a gigantic fortune.

Eleven thousand pounds! A mere bagatelle. At five per cent. five hundred and fifty a year only!

His train was due to start at five. About four o'clock, Raffalevsky came up to him from another table. The Russian's face was white as death. 'I've lost all,' he murmured hoarsely, drawing Hugh aside. 'The whole, the whole, my three hundred thousand francs of borrowed capital!—And what's worse still, I borrowed it from the chest—government money—the treasury of the squadron!—If I go back alive, I shall be court-martialed.—For heaven's sake, my friend, lend me at least a few hundred francs to retrieve my luck with!'

Hugh put his hand to his pile and drew out three notes of a thousand francs each—a hundred and twenty pounds sterling in all. It was nothing, nothing. 'Good luck go with them,' he cried good-humouredly. 'When those are gone, my dear fellow, come back for more. I'm not the man, I hope and trust, to turn my back upon a comrade in misfortune.'

The Russian snapped at them with a grateful gesture, but without hesitation or spoken thanks, and returned in hot haste to his own table. Gamblers have little time for needless talking.

At a quarter to five, after a last hasty draught of champagne at the buffet, Hugh turned to go out, with his cash in his pocket. In front of him, he saw just an apparition of Raffalevsky rushing wildly away with one hand upon his forehead. The man's face was awful to behold. Hugh felt sure the Russian had lost all once more, and been too much ashamed even to renew his application.

The great door swung slow upon its hinges, and Raffalevsky burst into the outer corridor, bowed from the room with great dignity, in spite of his frantic haste, by a well-liveried attendant. There is plenty of obsequiousness at Monte Carlo for every player, even if he has lost his last louis.

They emerged once more upon the beautiful terrace, the glorious view, the pencilled palm-trees. All around, the sinking Italian sun lit up that fairy coast with pink and purple. Bay and rock and mountain-side showed all the more exquisite after the fetid air of those crowded gaming saloons. High up on the shoulders of the inaccessible Alps the great square Roman keep of Turbia gazed down majestically with mute contempt on the feverish throng of miserable idlers who poured in and out through the gaudy portals of the garish Casino. A serene delight pervaded Hugh Massinger's placid soul; he felt himself vastly superior to these human butterflies; he knew his own worth as he turned entranced from the marble steps to the beautiful prospect that spread everywhere unrolled like a picture around him. Poet as he was, he despised mere gamblers; and he carried eleven thousand pounds odd of winnings in notes in his pocket.

R'r'r! A sharp report! A cry! A concourse! Something uncanny had surely happened. People were running up where the pistol went off. Hugh Massinger turned with a shudder of disgust. How discomposing! The usual ugly Monte Carlo incident! Raffalevsky had shot himself behind the shade of the palm-trees.

The man was lying, a hideous mass, in a crimson pool of his own blood, prone on the ground—hit through the temple with a well-directed bullet. It was a horrid sight, and Hugh's nerves were

sensitive. If it hadn't been for the champagne, he would really have fainted. Besides, the train was nearly due. If you hover about where men have killed themselves, you're liable to be let in for whatever may happen to be the Monegasque equivalent for that time-honoured institution, our own beloved British coroner's inquest. He might be hailed as a witness. Is that law? Ay, marry, is it? Crowner's quest law! Better give it all a wide berth at once. The bell was ringing for the train below. With a sudden shudder, Hugh hurried away from the ghastly object. After all, he had done his best to save him—lent him or given him three thousand francs to retrieve his losses. It was none of his fault. If one man wins, another man loses. Luck, luck, the mere incalculable chances of the table! If their places had been reversed, would that morose, unsociable, ill-tempered Russian have volunteered to give him three thousand francs to throw away, he wondered? Never, never: 'twas all for the best. The Russian had lost, and he had won—eleven thousand pounds odd, for Elsie.

He rushed away and dashed headlong into the station. His own revolver was safe in his pocket. He carried eleven thousand pounds odd about him. No man should rob him without a fight between here and San Remo.

CHAPTER XLVIII.—AT BAY.

Honest folk give lucky winners a wide berth at the Casino railway station, lest they should be suspected of possible evil designs upon their newly got money. Hugh found, therefore, he could pick his own seat quite at will, for nobody seemed anxious to claim the dubious honour of riding alone with him. So he strolled along the train, humming a gay tune, and inspecting the carriages with an attentive eye, till he reached a certain first-class compartment not far from the front, where a single passenger was quietly seated. The single passenger made his heart throb; for it was Warren Relf—alone and unprotected.

He hardly knew why, but, flushed with wine and continued good fortune, he meant to ride back in that very carriage, face to face with the baffled and defeated serpent; for Hugh had already discounted his prospective victory. Warren was looking the opposite way, and did not perceive him. Hugh waited, therefore, till the train was just about to start from the station, and then he jumped in—too late for Warren, if he would, to change his carriage.

In a second, the painter turned round and recognised his companion. He gave a sudden start. At last the two men had met in earnest. A baleful light burned in Hugh's dark eye. His blood was up. He had run too fast through the whole diapason of passion. Roulette and champagne, love and jealousy, hatred and vindictiveness, had joined together to fire and inflame his heart. He was at white-heat of exultation and excitement now. He could hardly contain his savage joy. 'Have I found thee, O my enemy?' he cried out, half aloud. Another time, it was just the opposite way. 'Hast thou found me, O my enemy?' he had cried to Warren with an agonised cry at their last meeting in the club in London.

Warren Relf, gazing up in surprise, answered

him back never a word; he only thought to himself silently that he was not and had never been Hugh Massinger's enemy. From the bottom of his heart, the painter pitied him: he pitied him ten thousand times more than he despised him.

They stood at gaze for a few seconds. Then, 'Where have you been?' Hugh asked at last insolently. The champagne had put him almost beside himself. Drunk with wine, drunk with good fortune, he allowed his true nature to peep forth for once a little too obviously. He would make this fellow Relf know his proper place before gentlemen at last—a mere ignorant upstart, half way between a painter and a common sailor.

'To Paris,' Warren answered with curt decision. He was in no humour for a hasty quarrel to-day with this half-drunken madman.

'What for?' Hugh continued, as rudely as before. Then he added with a loud and ugly laugh: 'You need tell me no lies. I know already. I've found you out.—To see my cousin Elsie across to England.'

At the word, Warren's face fell somewhat ominously. He leaned back, half irresolute, in the corner of the carriage and played with twitching fingers at the leather window-strop. 'You are right,' he answered low, in a short sharp voice. 'I never lie. I went to escort Miss Challoner from you and San Remo.'

Hugh flung himself into an attitude of careless ease. This colloquy delighted him. He had the fellow at bay. He began to talk, as if to himself, in a low monologue. 'Heine says somewhere,' he observed with a sardonic smile, directing his observation into blank space, as if to some invisible third person, 'that he would wish to spend the evening of his days in a cottage by the sea, within sound of the waves, with his wife and children seated around him—and a large tree growing just outside his grounds, from whose branches might dangle the body of his enemy.'

Warren Relf sat still in constrained silence. For Elsie's sake, he would allow no quarrel to arise with this madman, flown with insolence and wine. He saw at once what had happened: Massinger was drunk with luck and champagne. But he would avoid the consequences. He would change carriages when they stopped on the frontier at Ventimiglia.

The bid for an angry repartee had failed. So Hugh tried again; for he *would* quarrel. 'A great many murders take place on this line,' he remarked casually, once more in the air. 'It's a dangerous thing, they tell me, for a winner at Monte Carlo to go home alone in a carriage by himself with one other passenger.'

Still Warren Relf held his peace, undrawn.

Hugh tried a third time. He went on to himself in a musing monologue. 'Any man who travels anywhere by train with a large sum of money about his person is naturally exposed to very great peril,' he said slowly. 'I've been to Monte Carlo, playing, to-day, and I've won eleven thousand pounds; eleven—thousand—pounds—sterling. I've got the money now about me. There it is, you see, in French bank-notes. A very large sum. Eleven—thousand—pounds—sterling.'

Still Warren said nothing, biting his lip hard, but with an abstracted air looked out of the

window. Hugh was working himself up into a state of frantic excitement now, though well suppressed. Fate had delivered his enemy plump into his hands, and he meant to make the very best use of his splendid opportunity.

'A fool in Paris once called in a barber,' he went on quietly, with a studious outer air of calm determination, 'and ordered him, for a joke, to shave him at once, with a pistol lying before him on the dressing-table. "If your hand slips and you cut my skin," the fool said, "I'll blow your brains out." To his surprise, the barber began without a word of reply, and shaved him clean with the utmost coolness. When he'd finished, the patient paid down ten pounds, and asked the fellow how he'd managed to keep his hand from trembling. "Oh," said the barber, "easy enough: it didn't matter the least in the world to me. I thought you were mad. If my hand had slipped, I knew what to do: I'd have cut your throat without one moment's hesitation, before you had time to reach out for your pistol. I'd say it was an accident; and any jury in all Paris would without a doubt at once have acquitted me."—The story's illustrative. I hope, Mr Relf, you see its applicability?'

'I do not,' Warren answered, surprised at last into answering back, and with an uneasy feeling that Massinger was developing dangerous lunacy. 'But I must beg you will have the goodness not to address your conversation to me any further.'

'The application of my remark,' Hugh went on to himself, groping with his hand in his pocket for his revolver, and withdrawing it again as soon as he felt quite reassured that the deadly weapon was safely there—'ought at once to be obvious to the meanest understanding. There are some occasions where homicide is so natural that everybody jumps at once to a particular conclusion.—Observe my argument. It concerns you closely.—Many murders have taken place on this line—murders of heavy winners at Monte Carlo. Many travellers have committed murderous assaults on the persons of winners with large sums of money about them.—Now follow me closely. I give you fair warning.—If a winner with eleven thousand pounds in his pocket were to get by accident into a carriage with one other person, and a quarrel were by chance to arise between them, and the winner in self-defence were to fire at and kill that other person—do you think any jury in all the world would convict him for protecting his life from the aggressor? No, indeed, my good sir! In such a case, the other person's life would be wholly at the offended winner's mercy.—Do you follow my thought? Do you understand me now?—Aha, I expected so! Warren Relf, I've got you in my power. I can shoot you like a dog; I can do as I like with you.'

With a sudden start, Warren Relf woke up all at once to a consciousness of the real and near danger that thus unexpectedly and closely confronted him. It was all true; and all possible! Hugh was mad—or maddened at least with play and drink: he deliberately meant to take his enemy's life, and trust to the authorities accepting his plausible story that he was forced to do so in self-defence or in defence of his money.

'You blackguard!' the painter cried as the truth came home to him in all its naked ugliness, facing Hugh in his righteous indignation like an

angry lion. 'How dare you venture on such a cowardly scheme? How dare you concoct such a vile plot? How dare you confess to me you mean to put it into execution?'

'I'm a gentleman,' Hugh answered, smiling across at him still with a hideous smile of drunkenness, and fingering once more the revolver in his pocket. 'I'll shoot no man without due explanation and reason given. I'll tell you why. You've tried to keep Elsie out of my way all these long years for your own vile and designing purposes—to beguile and entrap that innocent girl into marrying *you*—such a creature as *you* are; and by your base machinations you've succeeded at last in gaining her consent to your wretched advances. How she was so lost to all sense of shame and self-respect—she, a Massinger on her mother's side—as to give her consent to such a degrading engagement, I can't imagine. But you extorted it somehow—by alternate threats and cringing, I suppose—by scolding her and cajoling her—by lies and by slanders—by frightening *her* and libelling *me*—till the poor terrified girl, tortured out of her wits, decided to accept you, at last, out of pure weariness. A Man would be ashamed, I say, to act as you have done; but a Thing like *you*—pah—there—it revolts me even to talk to you!'

Warren Relf's face was livid crimson with fiery indignation; but he would not do this drunken madman the honour of contradicting or arguing with him. Elsie to him was far too sacred and holy a subject to brawl over with a half-tipsy fool in a public conveyance. He clutched his hands hard and kept his temper; he preferred to sit still and take no outer notice.

Hugh mistook his enforced calm for cowardice and panic. 'Aha!' he cried again, 'so you see, my fine friend, you've been found out! You've been exposed and discredited. You've got no defence for your mean secretiveness. Going and hiding away a poor terrified friendless homeless girl from her only relations and natural protectors—working upon her feelings by your base vile tricks—setting your own wretched womankind to bully and badger her by day and by night, till she gives her consent at last—out of pure disgust and weariness, no doubt—to your miserable proposals. The sin and the shame of it! But you forgot you had a Man to deal with as well! You're brought to book now. I've found you out in the nick of time, and I mean to take the natural and proper advantage of my fortunate discovery. Listen here to me, now: before I shoot you, I propose to make you know my plans. I shall have my legitimate triumph out of you first. I shall tell you all; and then, you coward, I'll shoot you like a dog, and nobody on earth will ever be one penny the wiser.'

Warren saw the man had fairly reached the final stage of dangerous lunacy. He was simply raving with success and excitement. His blood was up, and he meant murder. But the painter fortunately kept his head cool. He didn't attempt to disarm or disable him as yet; he waited to see whether Hugh had or had not a pistol in his pocket. Perhaps Hugh, with still deeper cunning, was only trying to egg him on into a vain quarrel, that he might disgrace him in the end by a horribly plausible and vindictive charge of attempted robbery.

'I've won eleven thousand pounds,' Hugh went on distinctly, with marked emphasis, in short sharp sentences. 'My wife's dead, and I've inherited Whitestrand. I mean to marry Elsie Challoner. I can keep her now as she ought to be kept; I can make her the wife of a man of property. You alone stand in my way. And I mean to shoot you, just to get rid of you offhand.—Sit still there and listen: don't budge an inch, or, by heaven, I'll fire at once and blow your brains out. Lift hand or foot and you're a dead man.—Warren Relf, I mean to shoot you. No good praying and cringing for your life, like the coward that you are, for I won't listen. Even if you were to renounce your miserable claim to my Elsie this moment, I wouldn't spare you; I'd shoot you still. You shall be punished for your presumption—a creature like you; and when you're dead and buried, I shall marry Elsie.—Think of me, you cringing miserable cur—when you're dead and gone, enjoying myself for ever with Elsie.—Yes, I mean to make you drink it, down to the very dregs. Hear me out. You shall die like a dog; and I shall marry Elsie.'

Warren Relf's eye was fixed upon him hard, watching him close, as a cat watches, ready to spring, by an open mouse-hole. This dangerous madman must be disarmed at all hazards, the moment he showed his deadly weapon. For Elsie's sake, he would gladly have spared him that final exposure. But the man, in his insolent drunken bravado, made parley useless and mercy impossible. It was a life-and-death struggle between them now. Warren must disarm him; nothing else was feasible.

As he watched and waited, Hugh dived with his hand into his pocket for his revolver, and drew it forth, exultant, with maniac eagerness. For a single second, he brandished it, loaded, in Warren's face, laughing aloud in his drunken joy; then he pointed it straight with deadly resolve at the painter's forehead.

MERCANTILE AGENCIES.

A CHAPTER ON TRADE INQUIRIES.

THE purpose for which these Agencies exist is to collect information regarding firms and trading companies for the guidance of banks or firms which have dealings with them. The information obtained consists of a general history of the firm from its commencement, the credit which may be safely given to it, and probably the capital at its command. Most Agencies produce annually several volumes of information, divided into towns and districts, and they contrive to give a general idea of a firm's position by ratings in a compressed form. The purchasers of these volumes—which are of course costly—are entitled to make inquiries of a closer nature regarding firms in which they are interested, and the Agencies make inquiries free of charge regarding firms not in their books. But besides the purchasers of these volumes, there are subscribers to the Agencies, who, in consideration of an annual fee, receive information regarding firms indebted to them.

The result is that in all quarters of the globe there are huge chronicles of mercantile successes and failures for the guidance of traders anxious to increase their business, but equally anxious to

avoid bad debts. Thus, if a firm of ship-builders on the Clyde receives an order from a firm in Chicago of whose standing they know nothing, they may, by telegraphing to London through a bank, ascertain in a few hours whether their new customers are safe and reliable.

In obtaining their information, various methods are employed by these Agencies. Sometimes the business community is divided into trades, and one member of the staff will have one trade which it is his duty to look after. He goes to the markets of that trade and becomes acquainted with the people connected with it. He knows in what estimation each firm is held and how far it is trusted. He records the losses of one and the tendency to speculation of another. But business men frequently go to the Agencies and make statements regarding their position, knowing that they will be inquired about; and their doing so may be of great service to them. For instance, if a trader takes up a new branch of the business in which he is engaged, he will be inquired about by all the new firms with whom he deals, and this may give rise to the remark, 'He is very much inquired about;' which suggests that he must be showing signs of weakness. But if the reason of the inquiries is known to the Mercantile Agency no harm is done. Another method of obtaining information is to call upon the firms and ask for it. This is done thoroughly in America, and statements embracing the assets, liabilities, surplus, and stock of traders are regularly recorded. The Agencies in that country seem to be fully alive to the national tendencies, for their Reports frequently contain a sentence something like: 'Claims to have a surplus of one hundred thousand dollars; has probably seventy thousand.'

But by whatever means the information is obtained, it is generally reliable and far-reaching; and if people are unfavourably spoken of, they are usually themselves to blame. An inquiry was recently made regarding a person whose address was in a street off a certain square in London; the question was, whether he was safe to trust for a thousand pounds. The reply at an Agency was: 'The address you give is a lodging-house. About a year ago a gentleman of this name took a room there. He left about three months ago, asking that letters for him might be taken in. He has not been back since. You should have references.'

A person who keeps himself in the dark in this manner and asks credit for such figures, should not be surprised if he finds it difficult to get any one to deal with him at all.

The fact that Mercantile Agencies exist and prosper is evidence that they are useful; and an important question for business men is, how far they can be useful to them. Of course, it is desirable, if not necessary, to have some information about their customers, and the usual practice is to ask their bankers, who go to the bankers of the customer. But bankers as a rule wish to speak well of their own clients, and the value of the opinion is largely measured by the temperament of the man who gives it. If he is sanguine, he will say 'Quite good.' But the Mercantile Agency may say that you should not go beyond one hundred pounds; and in this information the banker's opinion has been received and considered. In asking for information, it is

always wise to mention a sum, and that sum should not be far above the amount the person gives his bills for; otherwise, the information obtained may be misleading. There are firms who always make their inquiries for fancy amounts, because they say they only wish to do business with first-class people. This is very unjust, because the firm may have no occasion for, and may never ask credit for anything like the amount; and the fact that they are inquired about for such a sum may lead to the belief that they are trading beyond what their capital warrants. Most bankers, when their customers are inquired about for sums which they know to be fancy, refuse to give any answer whatever until the transaction is explained to them.

Properly used, there is no reason why Mercantile Agencies should not be a valuable guide to traders, and in many cases save them from long-firm and other swindles, which are supported almost solely by the credulity and indiscretion of merchants. The answers, 'A swindle' and 'Avoid' are the danger-signals; 'Perfectly safe' and 'Quite good' are the green lights. But even when a warning is given, the disposition to do business is so strong that it is often disregarded or disbelieved. A provincial firm recently inquired through their bankers regarding the standing of A, B, & Co., London, and whether they were good for one thousand pounds. The answer was: 'They only started a year ago; there is no A and no B in the firm, and caution is advised.' The provincial firm wrote again through their bankers that there must be some mistake; that the partners were G and F; that G told them he had rich friends, and that the amount mentioned was not too large.—Further inquiries being made, it was found that A, B, & Co. could give no satisfactory reason for trading under an assumed name; that both partners had been bankrupt a few years before—one of them under suspicious circumstances—and that bills had been seen drawn by the firm on one of the partners. The warning was more than justified, but probably it would not be regarded.

Another very important point for traders is the light in which they are viewed by the Mercantile Agencies. This also may be useful to them, particularly if they are young firms with their credit still to be established and developed. It is folly for them to ignore these institutions, or to maintain a prejudice against them because they rake up bygone misfortunes. This is not done needlessly; but it is clear that if a firm has stopped payment a few years before, it is not likely to be strong; and a fair opinion of its trustworthiness cannot be formed without taking the fact into consideration. Besides, the cause of the failure is usually stated, and if no discredit attaches to it, its importance is greatly minimised. When new firms or individuals endeavour to establish themselves, therefore, they are usually dependent upon credit for the means required to conduct their business. That credit which is readily accorded to an old established house with a good record is not given to them in a day. They have to show that they deserve it, and the Mercantile Agencies have immense influence in determining to what extent they are worthy of it. These facts should make young firms very careful of anything which might have a prejudicial effect. The first thing to

be thought of is character, which means honour and uprightness in every transaction the name has ever been connected with. Promptitude in meeting every bill as it becomes due is also essential. If this is not done, it is evident that a promising young firm may soon become, by simple carelessness, one of those hand-to-mouth concerns which employ the energy of the partners in staving off from day to day the inevitable crash. Further, every transaction which is not strictly in the way of business, or which a business man would have a difficulty in understanding, should be avoided, because it is sure to give rise to suspicion and have the worst possible construction put upon it. A firm should not get mixed up with any other concern outside their own line of business. 'Too many irons in the fire' is, as a rule, neither desirable, profitable, nor safe.

Most large firms have begun small, and the smallest firms aim at being large. Let them observe the ordinary rules of prudence, which even the largest firms cannot afford to dispense with, and their progress will be more rapid and sure. The knowledge that Mercantile Agency lights are shining upon them should have a salutary influence upon them and upon trade universally.

BOLSOVER BROTHERS.

IN FOUR CHAPTERS.

CHAPTER IV.—CONCLUSION.

THE secretary laid down the Report, took off his spectacles, and looked across the table at Mr Bysouth.

'And that is as far as you have gone?' queried the latter.

'That is our present limit; and I am really at a loss to know what further steps it behoves us to take in this very strange affair. Mr Bolsover is urgently pressing us for an immediate settlement of his claim, on the plea that business of importance will entail his lengthened absence from England in the course of a week or two. We have put the fellow off twice already; but I hardly know what excuse to make for further delay—more especially as the "Heron" has always prided itself on its promptitude in settlement. All the documents required by us have been duly supplied, and all are undoubtedly genuine; and yet in the face of these two Reports it seems impossible to doubt that there is fraud at work somewhere, the question, however, being in what direction we are to look for it, and what further efforts it is possible to make in order to unmask it. I never felt so baffled over a case before.' He lay back in his chair and nibbled the end of his quill and stared at Mr Bysouth.

'I hardly see myself what we can do further,' answered the latter, 'unless we put on a private detective to ferret into the antecedents of this Mr Bolsover, and thereby strive to find out something to his prejudice which would give us a handle for disputing, or delaying, almost indefinitely, the settlement of his claim.'

'Pardon me; but I fail to see how our doing so would help us in the way you seem to think it would,' responded the secretary. 'Even if the present Mr Bolsover should turn out to be one

of the biggest rogues unchanged, what then? He is his brother's legally constituted heir—on that point the sworn copy of the will in our possession is perfectly clear and explicit (a will, it is true, dated only three days before the testator's demise, one of the witnesses to it being Septimus Gazebrooke, and the other Emma Goodson, the nurse; but not disputable on that ground alone), so that if we pay the money, he and he alone is the man to whom we are bound to hand it over.' He nibbled at his quill for a few moments again, and then he said: 'I will take the papers home once more and sleep on them, or try to do so. Possibly a happy thought of some kind may come to me before morning.'

At this juncture there came a knock at the door and then a clerk entered from the outer office. 'There's a man in the waiting-room,' he said, addressing the secretary, 'who states that he is from Medbury Royal, and that he wants to see the Mr Lomax who was there about a week ago making inquiries about a Mr Bolsover. As Mr Lomax happens to be out, sir, what shall I say to the man?'

'Show him in here.' The secretary and Mr Bysouth exchanged glances.

Next minute there entered a thick-set, plain-featured, but by no means unintelligent-looking man—a working-man evidently, but at present dressed in his Sunday suit, in which he seemed by no means at his ease. He made an awkward little bow as he came in, and then stood holding his hat in front of him with both hands.

'Take a chair, Mr —. By the way, I have not the pleasure of knowing your name,' said Mr Smiley pleasantly.

'My name is William Bonsor, master-carpenter of Medbury Royal,' answered the man as he sat down gingerly on one of the leather-covered office chairs.

'And I am Mr Smiley, the secretary of the Heron Company. It was at my request that Mr Lomax went down to Medbury the other day to make certain inquiries with regard to the late Mr Evan Bolsover. Probably you were acquainted with Mr Bolsover?'

'No, sir; I was not. I never spoke to the gent in my life, though I've seen him many a time. But my wife's mother, Mrs Mims, knew him well, having been his housekeeper up to the time that he died.'

Mr Smiley drew a deep silent breath.

'Mrs Mims was one amongst others whom Mr Lomax saw when at Medbury. She appears to have answered all his questions very satisfactorily.'

'Yes, sir; I've no doubt she did that, when once the gent had hammered the nail of his questions well into her head. But she never thought of going beyond what he asked her, or of telling him something that was known to her and to nobody else. She's a curious body in her way, but by no means so chumpheaded as many folk make her out to be.'

'Mr Lomax seems to have had a sort of feeling that there was something in the background which he had not succeeded in getting at; but of course he was unable even to guess whether it was anything of consequence or not.'

'There was something in the background, sir; not kept there wilfully, as I've said already,

or out of any wish to hide things up, and it's that something I've come here to-day to tell you, because I think you ought to know it.' Mr Bonsor coughed behind his hand and then he said: 'Mr Bolsover—the dead one, I mean—was insured in your office for rather a heavy amount, wasn't he, sir?'

'The policy he effected with us was for the sum of five thousand pounds.'

Mr Bonsor gave vent to a low whistle.

'And he had only paid one half-year's premium when he died,' added Mr Smiley.

'And that made you a bit suspicious-like, and no wonder. Well, sir, I don't know whether what I've come to tell you will be found to have any bearing on the case, but, anyhow, I think it only right you should know of it. It was only yesterday it came to my ears. My wife told me, her mother having told her a few hours afore, which was the first either of us had heard of it. It seems that after Mr Lomax's visit, Grannie, as the young uns call her, got chewing things over a bit in her mind, and at last she began to fancy that, maybe, she had done wrong in not telling him all she knew, although, mind you, she had answered all his questions fair and above-board. The more she thought it over, the more worried and uneasy she grew, till at last she felt as if she must tell somebody, and get the opinion of a second party as to whether she had done right or wrong; so the end of it was she told her own daughter. Polly, like the sensible woman she is, insisted on telling me; so now you will understand, sir, how it comes about that I am here this afternoon.'

Mr Bonsor paused for a moment to blow his nose. Mr Smiley, metaphorically, was on tenter-hooks, but he was far too diplomatic to betray anything of what he felt. His visitor must be allowed to tell his story his own way.

'And now, sir, I'll come to what Grannie had to tell my Polly. It seems that she had a strong hankering to see her master after the poor man was dead (one never can account for the queer fancies some women have); but the door of the room where he lay was locked, and the second Mr Bolsover had the key, and she was too nervous to tell him what she wanted. So, taking the opportunity when he was out of the way, she opened the door with a key belonging to another room which happened to fit the lock, and went in. Well might she say to my Polly that she felt sure her eyes must be playing her some fool's trick. When she stared round, Mr Smiley, sir, the room was empty—no dead man was there! Grannie was not satisfied till she had peered under the bed, and even into the wardrobe; but no Mr Bolsover was to be found. Then she went out, locking the door again and taking away the key, but not whispering a word to anybody.' Mr Bonsor paused and looked at Mr Smiley.

'The news you bring is very strange news indeed, Mr Bonsor,' said the secretary after a few moments, 'and it may not impossibly prove of the utmost value to us in the inquiry we are at present instituting.—Mr Bolsover was stated to have died on the afternoon or evening of Tuesday the 15th. Do you happen to know on which day it was that Mrs Mims visited the locked-up room?'

'It was on the Thursday morning early, before the other Mr Bolsover arrived at the Cottage.'

'It was on the evening of that day, Thursday, that the undertakers are said to have fetched away the body for conveyance to London.'

'I have something yet to tell you, sir, bearing on that part of the business,' said Mr Bonsor in his quiet phlegmatic way.

'Indeed! I shall be most pleased to listen to you.'

Thereupon Mr Bonsor proceeded to narrate a certain little circumstance with which the reader is already acquainted—namely, the fixing by Mrs Mims of two pins and a piece of cotton on the inner side of the door of Laburnum Cottage, and how, on going there at an early hour next morning, she found her simple trap exactly as she had left it. But while the housekeeper had only done as she did with the object of satisfying her own somewhat morbid curiosity, she had unconsciously been acting as an invaluable agent for the Heron Insurance Company, and had unwittingly been the means of unmasking one of the most barefaced frauds that was ever attempted to be perpetrated.

Presently Mr Bonsor was dismissed with many thanks, and a promise that the service he had rendered should before long meet with some more substantial recognition than mere barren expressions of good-will.

'The arch scoundrel!' exclaimed Mr Smiley as soon as he and Mr Bysouth were left alone.

'After all, then, it would seem that the funeral was a sham one,' remarked the chairman.

'There can be little doubt on that score now.'

'And the two Mr Bolsovers?'

'Will be found to have been one and the same person.'

'Mr Gazebrooke?'

'A confederate, without a doubt. These things are rarely carried through single-handed.'

'Both the nurse and the doctor must have been in the plot.'

'Undoubtedly. The young doctor's strange disposition when Lomax introduced himself is now accounted for. It seems a thousand pities that a man in his position should have lent himself to so nefarious a scheme.'

When, between six and seven o'clock the following evening, two officers of police proceeded to No. 38 Persimmon Street, they found the nest empty and the birds flown. Those they were in search of could not have been long gone, seeing that in one of the rooms a partly burnt envelope was found bearing a postmark of the day before. By what means, or through what agency, they had been warned in time to enable them to make good their escape, was never discovered.

Further inquiry in the course of the following day brought to light another fact—that Dr Lindley also had disappeared. In his case it was afterwards made clear whence his warning had come. It seems that, a little time before, he had attended one of Bonsor's children through a bad attack of fever, and had so impressed the master-carpenter's wife with his skill and kindness on that occasion, that while her husband was away in London, she went to the young doctor without saying a word to any one, and hinted to him on what errand her husband

had left home. She, of course, knew that Dr Lindley had attended Mr Bolsover; but how far he might be implicated in the matter which had taken her husband to London, she could only vaguely surmise. In any case, as she said to herself, it could do him no harm to put him on his guard, and it might chance to do him a lot of good.

No effort was made to trace or follow Lindley, who by-and-by found employment as an assistant in Canada. In the course of time his uncle, to whom he had made a clean breast of everything, forgave him, and, later on, bought a practice for him in one of the largest cities of the Dominion, where, in lack of any news to the contrary, it may be assumed that he still lives and flourishes, a wiser and, it may reasonably be hoped, a better man.

As to the mode by which the acceptance for the eighty pounds came into Gazebrooke's possession, Lindley was never enlightened, and it was a mystery which, for obvious reasons, he thought it as well to allow to remain unsolved.

Some three years later than the events herein narrated, Messrs Bolsover and Gazebrooke—under different aliases—made a compulsory appearance before an aggrieved public, they having been brought to book in consequence of some long-firm frauds of a more than ordinarily audacious kind in which they were found to be the leading spirits. Thus were two enterprising careers brought to a premature close for a long period to come. Both of them were men who had been well brought up, and who had started in life with many advantages; but temptation had come in their way; they had not had strength of mind to resist it, but had fallen, as fall so many others. The so-called Nurse Goodson proved to be the wife of Bolsover and the sister of Gazebrooke.

THE AUSTRALIAN DINGO AT HOME.

AMONG the strange animals produced by Australia—its kangaroos, varying in size from six feet in height when fully erect to that of a diminutive mouse; its pigmy geese, which perch upon the tops of high trees; its gigantic kingfishers; its mewing cat-fishes, and its egg-laying platypus and ant-eater—the country brings forth another animal which has puzzled naturalists almost as much as any of the foregoing, by reason of its singular association with its marsupial companions—the Dingo, or native Australian wolf. The only four-footed creature on that vast continent which does not either carry its immature young in a pouch or rear them from eggs, it seems totally out of place among the strange forms by which it is surrounded. It is as truly a wolf as any that ranges the Black Forest or hunts the wapiti in North America; a fleet and powerful animal, which makes an easy prey of the defenceless kangaroos, but never in any circumstances attacks man.

How did this 'dog' manage to obtain a footing in Australia? Is it the descendant of domestic dogs accidentally left on shore by early European navigators? Was it brought into the island by the present aborigines; or is it a truly indigenous animal, a genuine member of the fauna from which it differs so essentially? These are the

questions naturalists have been asking themselves ever since the animal became known; and there is no immediate prospect that a direct answer will be found, although we can approach very near to the truth by inferences from all the circumstances. The theory of the dingo's possible descent from any domestic variety introduced by early discoverers may easily be disposed of. No captain of a ship would be likely to leave his dog, the pet of the ship, on an island which he had just discovered. The first settlers of course took their dogs with them; but they found, to their cost, as soon as they turned out sheep on the Australian pastures, that the dingoes were already numerous, and to be met with everywhere—from Port Jackson to Port Phillip, a distance of some four hundred miles; and when the coast was further explored at various points, extending over at least seven thousand miles, there was the ubiquitous dingo.

The country has been known only about a hundred years. It is incredible, then, that any dog introduced by white men could within that period have spread far and wide over a territory some two-thirds the extent of Europe, and have penetrated to the remote interior. In whatever direction the sheep-farmer advances, and however far back into the bush he takes his flocks—even to six hundred miles from the coast—he is certain to find this enemy ready to attack the fleecy strangers at all times of the day or night.

From all the circumstances, we are driven to the most probable conclusion that this dog was either imported at a very remote period by the aborigines, possibly from New Guinea, where it is also found, or that it is a remnant of a still more remote era when Australia and Asia were part of one continuous land surface.

The dingo is a distinctly handsome animal, of sable colour, the tail, which is frequently full and bushy, being always tipped for about three inches with white; while the chest has a white patch about the size of a man's hand. The weight of a fine dog will reach sixty pounds. The head is rounder and broader than that of the ordinary wolf, and the muzzle relatively shorter. Black specimens are occasionally met with; but these are merely instances of *melanism*, of the same character as the black rabbits sometimes seen in an English wood, and do not constitute a different species. Visitors to the London Zoological Gardens during the past seven years will perhaps have noticed a pair in the cage adjoining that of the Asiatic wolves. These were genuine wild dingoes, caught in Australia, though not very fine specimens to the eye of one accustomed to those to be found on the wooded broken country about the Maranoa and Warrego rivers in Queensland. All the wild dogs of the world breed more or less frequently in captivity, and the dingo is no exception. The writer remembers a litter of pups in the Zoological Gardens about four years ago, one of which, curiously enough, was black and white, a mixture quite unknown in the wild state. While these pups allowed themselves to be handled freely by strangers, and behaved very much in the manner we are accustomed to expect in the young of our domestic dogs, the mother retired shyly into a corner. It would seem, then, that as soon as they became acquainted with human beings they showed that disposition to make

themselves familiar which has rendered the dog the friend of man in every part of the world.

Dingoes have often been exhibited at English dog-shows. We were invited on one occasion to inspect the kennels of an exhibitor, Mr W. K. Taunton, well known for his interest in foreign breeds, who, somewhat to our temporary consternation, suddenly opened a door, whence an animal, easily recognised at the first glance as a dingo, dashed into the yard and bounded towards us. After a critical examination of our trousers with his nose, that no doubt assured him in some mysterious manner of the respectability of his visitors, he paid us the compliment of mumbling our hands in his mouth rather roughly but playfully, and in various canine ways showed his satisfaction with his new acquaintances; though he had not many months previously been running wild in the Australian bush and regarding man as his deadliest enemy. This was one of the very finest specimens we ever saw, and as a matter of course 'Captain Burton' carried off all the prizes in his class wherever he went.

The female dingo takes much pains to bring up her family in a safe retreat. This is sometimes selected among broken masses of rock upon the side of a hill; but in the vast stretches of heavily timbered country, where no such shelter can be obtained, she must put up with a hollow log. Many of the fallen trees have been blown down by hurricanes, or have died of old age as they stand, when colonies of white ants attack the roots; and the trunks having no longer any hold on the earth, necessarily fall. In process of time the white ants gradually destroy the whole of the inner wood, which crumbles to a powder easily scraped out by an animal. In the pipe thus formed the dingo finds a suitable nesting-place. When out on the run one day with our flock, the sheep-dog attracted attention to a hollow log by his energetic demonstrations; and on the following morning we cut a hole some ten or twelve feet from the open end, and cautiously inserted our arm up to the shoulder; when a good deal of snarling and snapping and the feel of a furry coat betrayed the presence of a litter of four dingo pups, who were abstracted, and promptly despatched in the interests of the sheep. The young are singularly unlike their parents, of a sooty brown colour, and entirely devoid of the white tip to the tail and white chest-mark which come after the change of the juvenile coat. In the far 'back bush' young dingoes may often be seen in the camps of the blacks. It is a remarkable fact that these perfectly wild dogs take to their human masters and join in their hunting expeditions, and never, if the assertions of the blacks are to be trusted, show any disposition to return to the wild condition—so great is the influence of man over the inferior creation, even when he is represented by such poor specimens of humanity as these Australian savages.

The natural food of the dingo is, of course, any animal he can catch, the smaller kangaroos and bandicoots especially; but he prefers lamb to any other food, as the squatters know only too well, though mutton in any shape is always welcome. Wherever dingoes abound, as they do in all forest country, the utmost watchfulness of the shepherd is needed. In the daytime he must be constantly on the alert to see that the enemy does not

suddenly rush in among the flock and cut off a 'point,' that is to say, a party of a dozen or a score, and send the remainder off helter-skelter for a mile before they will stop. The reader will bear in mind that the country is totally different from that on which sheep graze in this part of the world, or any other except Australia. Generally speaking, the shepherd has under his charge a flock of more than a thousand active sheep, feeding in a forest of heavy timber, the ground covered with grass and undergrowth, where, at times, he can keep but a small proportion of his charges under view. The dingo has thus many opportunities for sneaking up and making a rush at the defenceless sheep, even when a good dog is on the watch. If the enemy succeeds in his attack, a number of sheep will probably be lost, driven from their companions and scattered in all directions, to become the easy prey of the dingoes for miles round about; while the remainder of the flock are nervous, suspicious, and difficult to manage for some days afterwards. One instance will suffice to show the destructive propensities of these animals. A shepherd came in to the head station one afternoon from his hut, distant some four miles, to report the loss of about a hundred sheep, which had been cut off from his flock by two or three dingoes. Men and dogs immediately started in pursuit, and the missing ones were found towards evening in a sad plight. The dingoes with their invariable cunning had rushed the stupid creatures up to the bank of a creek, or small deep stream, and had amused themselves by racing round them, biting through their hind-legs, and literally in some instances tearing the flesh off their hind-quarters. Many were quite dead, many fatally injured, and at least half of the number had been snapped here and there by the cruel jaws of their assailants. Patches of bloody wool lay about in every direction; and so utterly stupefied with fear were the miserable wretches, that they remained jammed in a compact mass until dragged away one by one and committed to the care of the dogs. All this havoc had been wrought in a short time by two or certainly not more than three of the savage marauders.

At night, the shepherd's anxiety may be even greater than in the daytime. His hut is close to the sheep-yard—a circular enclosure of stakes driven into the earth, and strongly bound together with rails and interlaced saplings. Suddenly he may be awakened by an ominous sound like distant thunder—the sheep rushing round inside the yard. Outside for certain there is a dingo, or perhaps two, galloping round, in the hope of so frightening the sheep that they may break out of the yard, when nothing would prevent them from dispersing in all directions. For some reason, the dingoes seem reluctant to jump into the enclosure, which they could do with the greatest ease. There is little doubt that, but for the prompt interference of the shepherd, these constant rushes of the sheep—the weight of hundreds pressing against a weak part of the fence—would have the desired effect. A breach once made, the sheep would pour through it into the jaws of their expectant foes.

In every shepherd's possession will be found a small bottle of strychnine. When a sheep dies anywhere, in the yard or out on the run, it is his duty to skin it, hang up the pelt on the fence, or

carry it home with him, make several shallow cuts in the body, and with the point of his knife drop into each a grain or so of the deadly poison, for the benefit of the dingoes. The sheep-dogs are taught never to touch these carcases; but occasionally they do fall victims to the bait intended for their wild relations. Advantage is taken of a habit of the dingo to compass his destruction thus: he seems very fond of following a man, especially on foot, and still more so the ration-carrier when taking round a packhorse laden with salt beef and groceries for the shepherds. He keeps at a respectful distance, perhaps on the chance of picking up anything that may be dropped. Much to his satisfaction, he finds a nice piece of fresh beef or mutton just enough to be swallowed at one gulp. In the middle of that *bonne bouche* is a grain of strychnine, and within half an hour he is the best of all dingoes—a dead dingo. The ration-carrier has a canvas bag full of such tempting morsels, which it is hoped will settle accounts with some old offender against the peace of the flock.

In its native state the dingo never barks, but utters a prolonged mournful howl, exactly like that of a domestic dog when he 'bays the moon.' The howl is the vocal expression all over the world of the wolf's feelings, barking being an acquirement developed only in human society. The keeper at the Zoological Gardens told us, however, that both the dingoes there, brought from widely distant parts of Australia, learned to bark in a very short time after their arrival—he thought from a pair of half-bred Eskimo and Newfoundland dogs in the adjoining kennel.

Fortunately, the dingoes, even where numerous, do not hunt in any considerable packs, four or five being rarely seen in company; otherwise, they would have made the rapid pastoral occupation of Australia impossible. On dark, sultry nights they prowl close to station buildings, on the lookout for anything that may be snapped up. A party of us, sitting on the veranda to catch whatever air might be stirring one of these oppressive nights, heard at intervals the howls and snarlings of two or three dingoes about the open space in front of the house. Domestic dogs are always inimical to their wild brethren; and our little black-and-tan terrier felt himself capable of doughty deeds on this particular occasion, if his haughty spirit may be measured by his furious excursions into the darkness and his challenges to the enemy at the top of his high-pitched voice. 'Jock' had returned several times to the veranda well satisfied with the results of his prowess, for had he not struck terror into the breasts of the enemy! That occasional growl as he lay between us betokened his perception of stealthy footsteps wholly inaudible to us, and with a shrill yell he once more dashed out into the darkness. Suddenly the sharp barking ended in a stifled cry, and silence reigned supreme for the rest of the evening. We turned into our blankets with sad hearts, for there could be no doubt that the gallant little fellow had been snapped up and eaten by the dingoes.

Whatever the reason may be, some dingoes will not take poisoned baits. It seems impossible that they can detect the strychnine by smell—at least it has no odour for us—but should ever so small a portion be on the outside of the meat, its intensely

bitter taste would be likely to make the animal drop it instantly. Once it is swallowed, its effect is certain; for this poison, unlike many others, never causes even the sensitive stomach of the dog to reject it by vomiting. In some districts where there is no natural permanent water-supply, the sheep are watered at small ponds filled from wells sunk in the earth. In the hot season, one of these ponds is poisoned, all the others being watched day and night to prevent the dingoes from visiting them. No one goes near the poisoned pond, so that at last the animals, impelled by thirst, are driven to drink the fatal water. Like all wild dogs, they are exceedingly difficult to trap or snare. It is an axiom with them that everything which has been touched by the hand of man should be regarded with suspicion.

Although they make most havoc among the young lambs, lying in wait to snap up the unsuspecting friskers from the very sides of their mothers, newly-born calves sometimes fall victims to the rapacity of the dingoes. They never venture to make any attack while the cow is present; but when she goes off to slake her burning thirst at the nearest water, leaving her helpless offspring for a few minutes, they pounce upon the weakly calf, and, tearing out its entrails, snatch a hasty meal before she returns to find the object of her affection past all maternal solicitude.

Recent accounts from the Darling river district show that the dingoes, finding such an abundance of easily procured food in the rabbits, have again begun to increase in numbers. One unfortunate sheep-farmer has had all the lambs but one from two hundred stud ewes destroyed by the pests; and many others have suffered in proportion.

We will conclude this paper by giving an instance of the sagacity displayed by dingoes in hunting their natural prey. The writer, accompanied by one of the stockmen on a large cattle-run in the Warrego district, went to hunt up some stray horses among the broken ranges; and in order to be on the safe side, two days' rations of salt-beef and 'damper' with the inevitable tea and sugar were provided. We had just rolled up our blankets, after camping out, preparatory to making up the fire and putting the billies on to boil, when we heard the heavy thud of a kangaroo leaping rapidly in a neighbouring scrub. 'It was the work of a moment,' as the old-fashioned novelists used to say, to get out our revolvers on the chance of a shot; but we paused to watch an interesting sight. A dingo was stealing swiftly along the edge of the scrub, parallel to the course of the kangaroo, and in ordinary circumstances a leaden messenger would have been promptly sent after him, with all the more probability of stopping him, as he paused occasionally to listen; but possible kangaroo steak was just then uppermost in our minds. In a minute or two the kangaroo suddenly broke for the open country, and the dingo, for whom he was evidently unprepared, made a splendid dash and pinned the marsupial by the shoulder. Almost instantly afterwards, a second dingo, who had no doubt been driving the game towards his companion, rushed out of the scrub and took the kangaroo on the opposite side. In spite of the poor beast's violent bounds hither

and thither, he soon rolled over, and in an astonishingly short time the dingoes had put an end to his struggles. 'A fresh feed for certain now,' whispered the stockman, and we began crawling on our hands and knees towards the spot, about a hundred yards away, for a shot at the dingoes, who had been too much occupied in the excitement of the chase to notice us. The slightest noise, the chance breaking of a dead twig, or perhaps the motion of a tall blade of grass, sufficed to alarm them, and though the revolver bullets cut up the earth close to them, both went away unscathed. The kangaroo was quite dead. How they had mauled him in those two or three minutes! His chest was torn open under the foreleg, and his neck bitten through and through. These wild dogs seem to know instinctively where the great arteries are situated, and, unlike our domestic hounds, understand perfectly well how to kill a kangaroo without incurring the risk of a fatal stroke from its powerful hindlegs, armed with those formidable chisel-like nails. Some fresh-cut steaks off the loin put us in good trim for the day's work.

'MIXED' QUOTATIONS.

NOTWITHSTANDING that many writers of repute have strongly condemned the use of quotations, it may confidently be asserted that a good quotation hardly ever comes amiss; and in many cases, as a gentleman who had a penchant for a little Greek observed, 'it wonderfully livens up a composition.' 'It is a pleasing break in the thread of a speech or writing,' says Mr W. F. H. King, in *Classical and Foreign Quotations*, 'allowing the speaker or writer to retire for an instant while another and a greater makes himself heard. A well-chosen quotation lightens up the page like a fine engraving, and, in the phrase of Addison, adds a supernumerary beauty to a paper, the reader often finding his imagination entertained by a hint that awakens in his memory some beautiful passage of a classic author.'

But the great objection to the use of other men's thoughts is that integrity of quotation—which is the least return that can be made—is rarely observed, more especially in public speaking, when the excitement of the moment frequently causes quotations to become mixed. The real cause, however, of most common forms of misquotation is the fact that man's memory is imperfect, and is often apt to prove treacherous at the last emergency. However often a striking passage may have been repeated, one can never feel certain that on some occasion two or more words will not be confounded, and consequently that the whole of the quotation will not be spoiled.

Man's weakness in mixing up quotations, allusions, and 'parts of speech,' has been frequently used in literature as a device for raising laughter. Costard, the clown in *Love's Labour's Lost*, apes the court-wit of Queen Elizabeth's time, and misapplies and miscalls like Mrs Partington or Master Dogberry; and everybody knows how important a factor the blunders of Mrs Mala-

prop are in the humour of Sheridan's delightful comedy. Thackeray, too, frequently resorted to this device. Take two examples from the *Yellow-plush Papers*: 'O fie! don't lay that flattering function to your sole, as Milton observes.'—'I think it's Playto, or els Harrystottle, who observes that what we call a rose by any other name would smell as sweet.' Of more modern authors, Miss Braddon has perhaps the greatest weakness for putting misquotations into the mouths of her characters, her sporting baronets being almost invariably 'great at' quoting from 'that fellow Shakespeare.'

Dickens, as everybody must have noticed, had a decided leaning in this direction. Not to mention Captain Cuttle, Dick Swiveller ('who was in the habit of running on with scraps of verse as if they were only prose in a hurry'), and others, we find Mr Pecksniff frequently mixing up quotations and allusions. Said that gentleman: 'Unlike the young man in the Eastern tale who is described as a one-eyed almanack, if I am not mistaken, Mr Pinch?'—'A one-eyed calendar, I think, sir,' said Tom.—'They are pretty nearly the same thing, I believe,' said Mr Pecksniff, smiling compassionately. Nearly all the principal characters in *Martin Chuzzlewit* are made to commit blunders something after this style; and, indeed, no inconsiderable portion of the fun in Dickens's writings depends upon the characters either 'dropping into poetry' or 'mixing' quotations.

On the score of 'realism,' objection might perhaps be taken to the proposition that footmen and nurses are in the habit of quoting and alluding to the classics; but as we are all disposed to allow a good deal of license to the novelist, it may be admitted that the habit of relying largely on mixed quotations for producing amusement is legitimate. In novels dealing with the higher grades of life, indeed, such a course, if not carried to excess, would be true to nature, since almost everybody is fond of showing his or her 'book-learned skill,' and consequently of occasionally misquoting, though rarely to such an extent as that worthy baronet who, according to the perfectly trustworthy testimony of Thomas Ingholdsby, gave an entirely new reading to a famous passage:

Who steals my purse steals stuff!—
'Twas mine—'tisn't his—nor anybody else's!
But he who runs away with my good name,
Robs me of what does not do him any good,
And makes me deuced poor!

Burlesque apart, however, this 'familiar quotation,' in common with the 'Tis true, 'tis pity,' &c., and Byron's lines commencing, 'Freedom's battle once begun,' is frequently murdered.

The well-known verse in Matthew about 'Not one jot or tittle' is a great stumbling-block to preachers. It is stated of a well-known preacher who tried to quote it that he rendered it not one 'tot or jittle.' Then he saw that he had erred, and tried again. 'Not one jitt or tottle,' said he, and again stopped. But he would not give up, and began, 'Not one tit or jottle,' and, then with a red face he abandoned the attempt and went on with his sermon.

The majority of mixed quotations rarely fall short of being absurd. Many, again, are hashed

owing to the confusion of two or more words, as a leader-writer completely murdered Shakespeare's well-known line, 'An honest tale speeds best being plainly told,' by transposing the words 'honest' and 'plainly.' Another common blunder consists in attributing quotations to the wrong authors; and in this connection, by-the-by, everybody must occasionally wonder how many good things have been fathered on Shakespeare! Quotations from all sorts of poets and of all ages, from Spenser to Tennyson (both inclusive), are 'put down to the Bard,' as a theatrical 'catchword,' once very popular, phrased it, without the slightest compunction. But if sense-memory were cultivated instead of syllabic memory, which almost always requires one to begin at the beginning, and quotations, in case of doubt, ascribed to 'the poet,' there would be fewer blunders of this kind.

AN ADVENTURE IN THE FLOODED THEISS.

OUR 'oldest inhabitant' in this part of Hungary has seen some unpleasant weather in his time: summer droughts that withered every green thing, autumn waterspouts that washed the townsfolk out of their beds; but for a winter of snow, he remembers nothing like this year of 1888. The snow was everywhere, blocking railway trains, obliterating roads, burying hamlets in one night, so that the dwellers therein had to get out of their houses by the chimneys. The vast Hungarian plain was hidden for weeks under a white shroud; and in the Carpathians, the snow was so deep that valleys were levelled up, and forests were unseen beneath their covering of ice crystals.

All through the spring even, till the Ides of March were come and gone, the frost never relaxed its grip upon mountain and plain; thus the storage of accumulated snow was in no way reduced; and we knew there would be mischief when the warm winds came, more especially if the thaw were sudden.

My home is about twelve miles from the Theiss, on a spur of the Tokay Hills. I am very glad to be at a respectful distance from the river, particularly since the engineers in their wisdom have seen fit to interfere with nature in a way she will not stand. The Theiss in its natural course describes a perpetual letter S after descending from the mountains; but the engineers, in what they call regulating the river, have shortened its meanderings by cutting straight canals across the turnings and twistings. The result is that the melted snows come down from the Carpathians in as many days now as formerly in weeks, and in consequence the floods are much more destructive than they used to be. This spring, as we feared, the change of temperature was very sudden, and then every day came fresh tales of disaster. The Theiss was reported to be in places thirty-five feet above its summer level. I was anxious to see how things really were, and so I started off one morning with my servant in a light cart, intending

to go firstly to Tokay. We drove along all right for an hour; but on approaching the village of Kerester, on the Bodrog, we found the principal street already three feet in water, and the river was reported to be rising. The people were busy moving out their goods and chattels in boats; and there was much tribulation and wringing of hands, for the houses, of sun-dried bricks, were many of them melting away in the brown waters. We pushed on by the main road, but found ourselves stopped by something like six feet of water. I determined to send my servant on with the trap by a rough disused road over the hill, while I struck across the vineyards by a bee-line to the town. It was just hereabouts that Klapka the Hungarian defeated the Austrian General Sellick in 1849—a memorable day in the War of Independence.

After a toilsome trudge over the uneven ground, I soon came upon an extensive view to the eastward, and saw for myself the ravages the floods had already made. The aspect of the country was quite changed, for there was an extensive lake where fertile fields had been, and many familiar landmarks were submerged. Reaching Tokay, I learnt that sixty houses had fallen, and many others showed ominous cracks and settlements. After an early dinner at the inn, which fortunately was above high-water mark, I hurried off to an embankment where they were making every effort to keep back the invading waters: if they failed, a fresh tract of country would be flooded. It was a scene of great activity—carts drawn by white oxen with enormous horns were perpetually bringing up sack-loads of earth to build up the defence; numbers of soldiers were at work, so that it had something the aspect of a place besieged. Near by, the government have a large salt-store: the water was rushing through like a millrace—three thousand tons had been already washed away. Leaving my own conveyance at Tokay, I procured a lighter but rougher cart to drive to the village of Tardos, as I wished to see how things were going on farther down the Theiss. The village is situated on a natural ridge, so that we had a stiff pull at the last bit of the road. On attaining the summit, we realised at once how extensive the floods were here. With my field-glass I could see a few houses of Tisza-Eszlar standing out of the water. This was the place made so notorious three or four years ago by the alleged murder of a Christian girl by the Jews.

At Tardos I procured a boat to take me across to Tisza-Lök, as it was my intention to stay a day or two at Baron V——'s place in the immediate neighbourhood of this small town. My boatman, an intelligent old man, enlarged upon the engineering mistakes that had been made in regulating the Theiss. 'You can't stack up water like a rick of hay,' said he, 'and you can't make straight what God ordained should be crooked. The floods are far worse than they used to be. What is wanted is a free outlet for the rivers of Hungary at the Iron Gates of the Danube; but politics get mixed up with things as ought to be done down there.' He was a shrewd old fellow, and had hit the right nail on the head.

We were some time getting across the river, for it was nearly two miles wide, and the current was strong; besides, we had to take care of submerged

trees, snags, and such-like. There was a magnificent sunset, which dyed the waters crimson, so that earth and sky were mingled in a glowing canopy of roseate flame very wonderful to behold, but passing all too quickly. Landing while it was yet light on the top of the dam which is supposed to protect the little town or village, we beheld a terrible scene of disaster. At least two-thirds of the village of four thousand inhabitants was in ruins. The scene of confusion was indescribable. Soldiers were going about in pontoons, taking the people off from mounds, walls, or vanishing ridges of earth, to some ark of refuge on higher ground. Pieces of furniture and the bodies of dead animals were floating about in the muddy waters, that had invaded the town from the other side of the embankment. The telegraph poles had given way and were lying with their entangled wires across a mass of floating timber. It was heart-rending to see the poor people, hundreds of them, encamped out on every available bit of higher ground. Some had set up a temporary shelter of boards and matting, against which were piled such remnants of their household goods as they had saved. Here and there a cow was tethered, with a bare bundle or two of fodder, the sight of which must have filled the poor beast with dismay, if she could have thought of the morrow. The people were marvellously patient in their trouble; but it was sad indeed to see the sick and old folk turned out without a roof to cover them. The children were mostly gay and frolicsome, thinking it all good fun, poor little souls; they had had their suppers probably, and the doubtful breakfast was the other side of a jolly picnic night under the bright stars.

Baron V——'s place is happily well out of the reach of the flood. Of course he was occupied with directing such measures of relief as were possible in the face of this widespread disaster. A gentleman who arrived shortly after I did at the Baron's, told us he had passed a terrible time at the village of Tisza-Kénéz the night before. It seems that in the middle of the night, in profound darkness, they were roused from sleep by the dread sound of the tocsin and the shrill call of the bugle. Every soul knew at once that this meant the waters were breaking over the dike that hitherto had safeguarded them from the flood. The whole village turned out together with a detachment of a hundred soldiers. There was a hurrying to the spot where danger threatened, amidst call to arms, cries, orders, and counter-orders. 'The whole scene,' said our informant, 'was lit up by the flare of petroleum torches, darting to and fro like fireflies in the blackness, while the agitated mass of angry waters was visible under the glow of a dozen bonfires burning on the edge of the embankment.' The poor people, men, women, and children, it seems, worked with desperate energy all through the night; and happily, when the sun rose, they were rewarded with the certain knowledge that the ruin and desolation of their homes and fields were averted, at least for the present.

The morning after my arrival at Baron V——'s I found that a relief party were to assist in conducting a raft of six hundred boards, wanted for the repairs of the dike at Tisza-Dada, a large village some miles farther down the river. As

they were rather short of hands, I offered to go with the corporal and four men who were to accompany the raft in a pontoon. We left Tisza-Lök at one o'clock: the weather was very fine; and for about two hours we drifted slowly but surely down the stream, our pontoon being tied to the raft. But we now approached a part of the river where the banks were higher and the strength of the current much stronger, so that the navigation of the raft became extremely difficult. At length at a sudden turn of the river we encountered a regular whirlpool. Here we came in sight of a steamer that was aground. Impelled by the force of the current, the raft with our pontoon in tow bore down straight for the steamer. I thought a collision was inevitable; but by great exertion and good luck, the raftsmen kept clear of the vessel. It was the nearest shave. No sooner had we escaped this danger than we sighted an enormous snag with its roots upwards, well out of the water and right in our course. Here we were not so fortunate; spite of every effort, the raft bore straight upon the snag. We were prepared, each with an oar in his hand; but we were brought up very suddenly and sharply. The difficulty now was to disentangle the floating mass of timber from the roots of the snag. I thought the whole fabric would have broken up; but literally by hook and by crook we got our raft free, and once more we were in the full swim of the stream. We were going at a great rate, and it was all very well as long as our course was straight; but the constant bends of the river were awkward. Seeing a row of partially submerged trees in front of us, we took the precaution to disconnect the pontoon; and it was well we had done so, for, carried round by the current, the raft went crashing into the trees. We saw at once that the raft was breaking up. Some of the outer logs were torn away by the swirl of the water, and drifted off in mid-stream. The men called loudly for help, which we quickly rendered them, and succeeded in rescuing two of the poor fellows who were half immersed in the water. To our dismay, we saw the other two, who were quite out of our reach, floating away on a portion of the wreck which had become detached. The logs turned round and round in the whirlpool, then headed into the very centre of the current, and were off at a pace swifter than any ordinary boat could follow them.

In our frantic efforts to give chase, our pontoon got jammed in between the trees. We were terribly afraid of a broken branch or snag knocking a hole in the iron, when our own fate might have been doubtful; so we were forced to be careful. At length we got free of this entanglement, and rowed with a will after the two luckless men, who were careering madly on their unwilling race. Fortunately they had a rope with them, and we were rejoiced to see that they threw this, lasso fashion, over some partly submerged trees. This brought them up sharp, and we thought all was well. We rowed for our lives; but our pontoon was heavy, and clumsy in the water, and did not make so much way as we could wish. We were now within fifty yards of them; another minute and we could have boarded them with the boathook,

which was held ready at the bow, when the rope that held the raftsmen snapped, and away they went on their half-dozen boards, caught as before in the strong current.

It was a terrible moment. We heard the shriek the poor fellows gave when the rope broke, and when they saw themselves whirled off again with nothing but a frail plank between them and the devouring flood. When all seemed dead against their chance of rescue, the portion of the wrecked raft was brought up by a hidden snag, that probably caught some hanging piece of chain. Now was our time. We stuck to our oars manfully; our boathook gripped their chains: we were alongside in another moment, and, thank heaven, the poor fellows were saved. I never saw men more thoroughly frightened; yet the Hungarian peasant is no coward.

We had now to make the best of our way to Dada, to render an official report of our mishap in losing the raft. It was well we had not to report the loss of life.

We found that the waters had not reached, and were not likely to reach, the large village of Dada, for it is on fairly high ground; but their farms were flooded. It is calculated that the Theiss has spread thirty miles inland; and it will probably be two years before the land is freed from the plague of waters.

IN SIGHT O' LAND.

Above the restful summer sea

The skies are clear, the winds are bland;

And the ship rides on full merrily,

In sight o' land.

Glad songs of home float on the air

From those upon the deck who stand;

And eyes grow dim and wistful there—

In sight o' land.

An hour—and friend with friend will meet,

Lip cling to lip, and hand clasp hand.

O how the heart throbs sorely sweet

In sight o' land!

But lo! athwart the radiant heaven—

(Alas for hopes by mortals planned)

The thick clouds of the storm are driven,

In sight o' land.

Cursed by confusion dark, as though

God had awhile resigned command,

The furious waves crash to and fro,

In sight o' land.

And that proud ship, which oft has crossed

The changeful sea from strand to strand,

With every soul on board, is lost

In sight o' land.

The morning comes, with joyant breath—

But cold and silent on the sand

Lie some who saw the face of death

In sight o' land.

'UNDER THE CHANGEFUL SKY.'

WITHOUT relying on any of the characteristics and qualifications of 'The Vagabond,' as depicted in the effective song of that name, it is nevertheless desirable that in summer and autumn we should spend as much time as can be commanded 'under the changeful sky.' There is no need to be 'ragged;' but it is very healthful to get 'tanned.' It becomes almost imperative, after an unduly prolonged winter and a winter-like spring and summer, with the compulsory imprisonment within doors which such hostility on the part of the climate entails upon many people, especially delicate women, that we lose no opportunity of inhaling all the fresh air we can when the weather is propitious.

That our skies are changeful, ought to be sufficiently understood to make it quite unnecessary for us to regard them or quote them as an excuse for not facing the elements on all and every occasion at this season. As a writer lately put it: 'Happily, in the case of the calendar we need not, as Hamlet says of the compass, "speak by the card, lest equivocation should undo us;" for it is not needful to dwell very long in this climate to discover that months are mere sounds designed to illustrate the progress of the year, and to serve as approximate guides to human expectation concerning green peas and divers other goodly fruits of the earth, but wholly fallacious as references to the ardency of the sun or to the bleakness of the blast.' Such being the case, it is curious to observe how little the English people appear ready to accept the fact. Although, with the dogged determination of their race, they seldom allow weather to interfere with their business or their set plans of pleasure, and are generally prepared to brave the inevitable reverses which temperature brings about in these latitudes, they nevertheless invariably express profound astonishment, dislike, or vain regret at the sudden alternations of the quicksilver. They entirely refuse, it would seem, to grow accustomed to its eccentricities, and speak and conduct them-

selves as if the most unlooked-for emergency had arisen, when the 'clerk of the weather' displays the least irregularity in his accounts, or fails punctually to post up the entries in his 'daybook' or his 'year's ledger.' It is just as if they were expecting him to conduct himself as a well-ordered methodical book-keeper would, and not in that happy-go-lucky manner of his, to which it might be supposed they would have become accustomed by long use.

However, provided we are allowed to grumble and express our petulant surprise, we, as a rule, are fonder of fresh air than most peoples. Through what vast experience it was of foreign lands—save those of Europe—that our 'Merrie Monarch' found himself in a position to declare that more time could be spent pleasantly in the open air in England than in any other country in the world, history fails to show! By some means, he, nevertheless, had a great truth borne in upon him, for there is a certain quality in our atmosphere, especially in summer, which for its enjoyability is not to be matched. Even according to the far wider experience which the modern ease of locomotion has put at the disposal of mankind, the dictum of the dissolute king has been found to be perfectly sound, and may be quoted as another proof of his never having said a foolish thing—if he never did a wise one.

Most fair weather in England is pleasant out of doors according as the temperature may suit our constitution; but a thoroughly fine summer day in the British Isles is simply unmatchable. The changeful sky constitutes the essence of the charm. The gentle western wind with just sufficient touch of south in it to deprive it of its sting, blowing up across the ardent sun a succession of soft fleecy clouds, casting ever and anon deliciously cool shadows over the landscape, varying its colour, and seeming to alter its form with every breath, bringing out and then concealing a thousand unlooked-for beauties and contrasts, whilst the gleams of light dazzle and rejoice the eye, soul, and body of man—where, or in what country in the world, is weather to be found

excelling this? Surely the monotony of the entirely 'blue unclouded'—lasting from earliest morn to latest eve, one day succeeding another, its actual counterpart, for weeks and weeks together, such as southern and eastern climes afford—cannot compare either for health or comfort with the changeful sky of a temperate climate. The weariness, the exhaustion of vigour and spirits produced, is destructive alike of character and constitution; whilst the three or four months of uninterrupted rain which often make the reverse of the medal in tropical lands, must beget equal lassitude, with a dreary indolence well-nigh compulsory.

No; the daily, hourly interchange of cloud and sunshine, despite all the temporary inconvenience of its incidental uncertainty, is preferable to the 'too much of a good thing'—whether of rain or drought, heat or frost—which many nationalities have to endure. No 'globetrotter' of experience doubts this; and albeit we have to put up with short summers in our own land, we may regard it as an argument in favour of making the most of them when they are here. Now cool, now warm, we must take them as they come; and with common precaution, body and mind will be the better for the variety. The sun-worshipper grumbles, of course, that his basking melting moments are so brief, yet he would grumble more if he were condemned to forego all the pleasures which the cooling winds and restful shadows largely help to multiply.

Then, too, let us not forget, as hinted above, the beauty-creating expression which the varying aspect of heaven's canopy gives to the face of nature. In it we see a reflex of the human countenance, serving to show that intimate relationship existing between the Great Mother and her sons and daughters. Apropos of this kinship, few poets have dealt with it more exquisitely than Wordsworth. It has been well said of him that 'he has given deeper and fuller expression to man's sense of his essential unity with eternal nature than even Shelley himself. There are moments when his verse is indeed instinct with

A presence and a spirit interfused,
Whose dwelling is the light of setting suns,
And the round ocean, and the living air,
And the blue sky, and in the mind of man.'

Truly, we cannot watch the changeful sky and its effect upon ourselves, no less than upon the landscape, without feeling the gentle pressure of the bonds which bind us with, and make us part and parcel of, nature. It teaches lessons and raises emotions in all thoughtful minds which few outdoor meditative occupations can exceed. According to the weather, our moods and fancies alter, our very will appears almost to be under the control of the elements, and every sensation that lies between gladness and sadness is revealed to us by them. The soft sunlit zephyrs brought across the fertile plains from below that blue

nothing of hill or line of sea on the distant horizon, partially veiling and breaking up the azure arch above with tender flecks of silver cloudlets; or the bold wild western gale driving before it the ponderous and ragged masses of gray vapour, carry definite and distinct influences on their wings, which seem to penetrate our souls whether we will or not. Only let us give ourselves up thoroughly to the contemplation of the outlook, and the most subtle distinctions can be traced in the thrills experienced by our nervous systems. Were it not so, we should be affected no more by the storm or hurricane than by the mild gray light of a still autumn day. If we were not linked inseparably with nature, and did not feel with her each turn on the compass, north-easters would be as pleasant as south-westerners. We should neither know nor care how high or how low the thermometer ranged—life, in fact, would be independent of atmosphere, instead of being, as it is, entirely dependent on it.

We wonder sometimes that the weather should form such a popular subject for comment; but when we think how all sentient things draw their breath from the 'living air,' it would be surprising, surely, if the quality of this essential food were not discussed with equal interest to that displayed about the more definite viands by which we appease our appetites. Doubtless, to the sensitiveness of our constitutions or of our nervous systems is due our consciousness of the degrees of change. Some people's digestions are so strong and their appetites so keen that they care little and note but little what they eat or drink; whilst others, more appreciative—that is, more sensitive and delicately constituted—instinctively, if not from compulsion, attend closely to the quality of their sustenance. So in the same way do these two orders of beings observe, and are influenced by, the quality of the air they inhale. With vegetation, again, the hardy plants increase and fructify in the face of weather that will not allow the tender growths to put forth a shoot; the latter have to stay indoors, as it were, until the changeful sky brings round their time and season for holding up their heads. The great system of natural selection and adaptation is thus seen to be based on a natural law as inscrutable as it is inexorable.

Finally, then, this much-abused English climate of ours produces this open-air food in the shape of oxygen and ozone of a more wholesome quality than any other country in the world. The changeful sky it is which affords opportunities for all persons to enjoy repasts of fresh air after their own hearts, and far oftener than under other conditions. All tastes can be gratified in succession; but, like the grass of the field, we must wait, of course, until the turn comes which suits our constitutions; and if many of us unhappily are relegated to long terms of imprisonment within-doors, on the whole they will be shorter from year's end to year's end than elsewhere, thus making good the 'Merrie Monarch's' dictum. His vagabondising nature, too, properly associates

him with the title of these rambling comments, and has entangled him in them much as his lamented father's head got mixed up with Mr Dick's 'Memorial'!

THIS MORTAL COIL.

CHAP. XLIX.—THE UNFORESEEN.

QUICK as lightning, Relf leaped upon his frantic assailant, and with one powerful arm, stiffened like an iron bar, dashed down the upraised hand, and the revolver in its grasp, with all his might, toward the floor of the carriage. A desperate struggle ensued in that narrow compartment. The two men, indeed, were just evenly matched. Warren Relf, strong from his yachting experience, with sinewy limbs much exercised by constant outdoor occupation, fought hard in sheer force of thew and muscle, with the consciousness that therein lay his one chance of saving Elsie from still further misery. Hugh Massinger, on the other hand, well knit and wiry, now mad with mingled excitement and drink, grappled wildly with his adversary in the fierce strength of pure adventitious nervous energy. The man's whole being seemed to pour itself forth with a rush in one frantic outburst of insane vigour. He gripped the revolver with all his utmost force, and endeavoured to wrench it, in spite of Warren's strong hand, from his enemy's grasp, and to turn it by sheer power of wrist and arm once more upon Elsie's new lover. 'Black-guard!' he cried, through his clenched teeth, as he fought tooth and nail with frenzied struggles against his powerful opponent. 'You shan't get off. You shall never have her. If I hang for you now, I'll kill you where you stand. I've always hated you. And in the end I mean to do for you.'

With a terrible effort, Warren wrested the loaded revolver at last from his trembling hands. Hugh battled for it savagely like a wild beast in a life-and-death struggle. Every chamber had a cartridge jammed home in its recess. To fight for the deadly weapon would be downright madness. If it went off by accident, somebody would be wounded; the ball might even go through the woodwork into the adjoining compartments. Without one moment's hesitation Warren raised the fatal thing aloft in his hand high above his head. The window on the seaward side was luckily open. As he swung it, Hugh leaped up once more and tried to snatch the loaded pistol afresh from his opponent's fingers; but the painter was too quick for him: before he could drag down that uplifted arm with his whole weight flung upon the iron biceps, Warren Relf had whirled the disputed prize round his head and flung it in an arch far out to sea through the open window. The railway runs on a ledge of rock overhanging the bay. It fell with a splash into the deep blue water. Hugh Massinger, thus helplessly balked for the moment of his expected revenge, sprang madly on his foe in a wild assault, with teeth and nails and throttling fingers, as a wounded tiger springs in its vindictive death-throes on the broad flanks of an infuriated elephant.

Next instant, they were plunged in the deep arch of a tunnel, and continued their horrible

hand-to-hand battle for several minutes in utter darkness. Rolling and grappling in the gloom together, they rose and fell, now one man on top and now the other, round after round, like a couple of angry wrestlers. The train rushed out into the light once more and plunged a second time into a still blacker tunnel. But still they fought and tore one another fiercely. All the way from Monte Carlo to the frontier, indeed, the line alternates between bold ledges that just overhang the deep blue bays and tunnels that pierce with their dark archways the intervening headlands. When they emerged a second time upon the light of day, Hugh Massinger had his hands tight pressed in a convulsive grasp upon Warren Relf's throat; and Warren Relf, purple and black in the face, was tearing them away with horrible contortions of arms and legs, and striving to defend himself by brute force from the would-be murderer's close-gripped clutches.

'Aha!' Hugh cried, as he held his enemy down on the seat with a gurgling in his throat, 'I have you now! I've got you; I've done for you. You shall choke for your insolence! You shall choke—you shall choke for it.'

With an awful rally for dear life, Warren Relf leaped up and turned the tables once more upon his overspent opponent. Seizing Hugh round the waist in his powerful arms, in an access of despair, he flung him from him as one might fling a child, with all his store of gathered energy. If only he could hold the man at bay till they reached Mentone, help would come—the porters would see and would try to secure him. He had no time to think in the hurry of the moment that even so all the world would believe he himself was the aggressor, and Hugh Massinger, with that great roll of notes stowed away in his pocket, was the injured innocent. Fighting instinctively for life alone, he flung his mad assailant right across the carriage with his utmost force. Hugh staggered and fell against the door of the compartment; his head struck sharp against the inner brass handle. With a loud cry, the would-be murderer dropped helpless on the floor. Warren saw his temple was bleeding profusely. He seemed quite stunned—stunned or dead? His face, which but a moment before had glowed livid red, grew pale as death with a horrible suddenness. Warren leaned over him, flushed with excitement, and hot with that terrible wild-beast-like struggle. Was the man feigning, or was he really killed?—O heavens, would they say he, Warren, had murdered him?

In a moment the full horror of the situation came over him.

He felt Hugh's pulse: it was scarcely beating. He peered into his eyes: they were glazed and senseless. He couldn't tell if the man were dead or alive; but he stood aghast now with equal awe at either horrible and unspeakable predicament. Only four minutes or so more till Mentone! What time to decide how to act in the interval? O dear heaven, those accusing, tell-tale bank-notes! Those lying bank-notes, with their mute false witness against his real intentions! If Hugh was dead, who would ever believe he had not tried to rob and murder him? Whatever came of it, he must try to recover

Hugh from his dead-faint at all hazards. Water, water! Oh, what would he not give for one glass of water! He essayed to bind up the wound on the head with his own handkerchief. It was all of no avail: the wound went bleeding steadily on. It went bleeding on; that looked as though Hugh were still alive. For if Hugh was dead, they would take him for a murderer!

Four minutes only till they reached Mentone; but oh, what an eternity of doubt and terror! In one single vivid panoramic picture, the whole awfulness of his situation burst full upon him. He saw it all—all, just as it would happen. What other interpretation could the outside world by any possibility set upon the circumstances? A winner at Monte Carlo, returning home to San Remo with a vast sum in bank-notes concealed about his person, gets into a carriage alone with a fellow-countryman of his acquaintance, to whom he would naturally at once confide the fact of his luck and his large winnings. He is found dead or dying in the train at the next station, his coat torn after a frantic struggle, and the carriage bearing every possible sign of a desperate fight for life between aggressor and defender. His revolver gone, his head broken, his arms black with numerous bruises, who could doubt that he had fought hard for his life and his money, and succumbed at last by slow degrees to the most brutal violence? Who would ever believe the cock-and-bull story which alone Warren Relf could set up in self-justification? How absurd to pretend that the man with the money was the real aggressor, and that the man with none acted only in pure self-defence, without the slightest intention of seriously injuring his wild assailant! An accident, indeed! No jury on earth would accept such an incredible line of defence. It was palpably past all reasonable belief—to any one but himself and Hugh Massinger—on the very face of it.

And then, a still more ghastly scene rose clear before his eyes, with the vividness and rapidity of a great crisis. At such supreme moments, indeed, we do not think in words or logical phrases at all; we see things unrolled in vast perspective as a living tableau of events before us; we feel and realise past, present, and future in incredible lightning-like flashes and whirls of some internal sense: our consciousness ceases to be bound and cabined by the narrow limits of space and time: a single second suffices for us to know and recognise at a glance what in other phases it would take us a whole hour deliberately to represent by analytic stages to our mental vision. Warren Relf, alone in that cramped compartment with Hugh Massinger, or Hugh Massinger's corpse—he knew not which—beheld in his mind's eye in a graphic picture a court of justice, installed and inaugurated: advocates pleading his case in vain: a *juge d'instruction* cross-questioning him mercilessly with French persistence on every detail of the supposed assault: a jury of stolid *bourgeois* listening with saturnine incredulity in every line of their faces to his improbable explanations—a delay—a verdict—a sentence of death: and behind all—Elsie, Elsie, Elsie.

Therein lay the bitterest sting of the whole tragedy. That Elsie should ever come to know he had been forced by circumstances, however

imperious, into laying violent hands on Hugh Massinger, was in itself more than his native equanimity could possibly endure. What would Elsie say? That was his one distinct personal thought. How could he ever bring himself even to explain the simple truth to her? He shrank from the idea with a deadly loathing. She must never know Hugh had tried to murder him—and for her as the prize. She must never know he had been compelled in self-defence to fling Hugh from his throat, and unwillingly to inflict that awful wound—for death or otherwise—upon his bleeding forehead.

Three minutes, perhaps, to Mentone still. On those three minutes hung all his future—and Elsie's happiness.

In the midst of the confused sea of images that surged up in endless waves upon his mind, one definite thought alone now plainly shaped itself in clear-cut mental outline before him. He must save Elsie—he must save Elsie: at all hazards, no matter how great—let him live or die—he must save Elsie. Through the mist of horror and agony and despair that dimmed his sight, that thought alone loomed clear and certain. Save Elsie the anguish of that awful discovery: save Elsie the inexpressible pain of knowing that the man she now loved and the man who once pretended to love her, had closed together in deadly conflict, and that Warren had only preserved Hugh from a murderer's guilt by himself becoming, in a moment of despair, perhaps Hugh's unwilling and unwitting executioner.

He glanced once more at the senseless mass that lay huddled in blood upon the floor of the carriage. Alive or dead? What hope of recovery? What chance of restitution? What room for repentance? If Hugh lived, would he clear Warren? or would he die in some hospital with a lie on his lips, condemning his enemy for the very assault he had himself so madly yet deliberately committed? What matter to Warren? Whichever way things happened to turn, the pain would be almost the same for Elsie. Concealment was now the only possible plan. He must conceal it all—all, all, from Elsie.

The train was slowing round a dangerous curve—a curve where the line makes a sharp angle round a projecting point—a triumph of engineering, experts consider it—with the sheer rock rising straight above, and the blue sea dimpling itself into ripples below. He moved to the door, and gazed anxiously out. No room to jump just there; the rock and sea hemmed him in too closely. But beyond, by the torrent, a loose bank of earth on the further side might break his fall, if he chose to risk it. Madness, no doubt, ay, almost suicide; but with only two minutes more to Mentone, he had no time to think if it were madness or wisdom: time only to act, to act for the best, on the spur of the moment, while action of some sort still was possible. At such times, indeed, men do not reason: they follow only the strongest and deepest impulse. Warren Relf did not wait to argue out the results of his conduct with himself. If he leaped from the train, he must almost certainly be stunned or maimed, perhaps even killed outright by the concussion. At best, he must soon be taken by the myrmidons of justice and accused of the murder. To get away unperceived, along that single track of open

coast, backed up in the rear by high mountains, was simply impossible. Had he stopped to reason, he might have remained where he was—and lost all. But he did not stop to reason; he only felt, and felt profoundly. His instincts urged him to leap while there was still time. He opened the door, as he reached the torrent, and looking out upon the bank with cautious deliberation, prepared to jump for it at the proper moment.

The train was slowing much more distinctly now. He thought the brake must be put on hard. He could surely jump as he reached the corner without serious danger. He stepped with one foot on to the open footboard. It wasn't much to risk for Elsie. A single plunge, and all would be settled.

(To be concluded next month.)

HOARDED SPEECH.

TEN years ago the world was astonished with a new mechanical marvel which in point of novelty and curiosity puts both the telephone and microphone into the shade. This was the phonograph or sound-recorder of Edison, a machine by which the words of our mouths or the music of our instruments could be hoarded up until a future time. That original phonograph was very imperfect, nevertheless it contained the germ of a great invention. Its broken punchinello utterance was at best only a clever mockery of speech, a travesty of music, but it was the forerunner of a more perfect apparatus. Any one acquainted with the mechanical arts might have foreseen that it would some day be followed by a practical instrument, and those who knew Edison believed that he himself would furnish it. The development of the electric light has diverted the attention of that inventor from the phonograph; but of late he has been engaged again in perfecting his favourite invention, and now at last he may be said to have redeemed his promises and fulfilled his anticipations with regard to it. The new or 'perfected' phonograph is now in England, under the charge of Colonel G. E. Gouraud, of Little Menlo, Beulah Hill, an old friend of Edison, and there, through his kindness, we have had the pleasure of seeing and hearing the wonderful machine speak for itself.

The original phonograph, which may be seen in the South Kensington Museum, consisted of a vibrating diaphragm or tympanum, which caught the sound of the voice or musical instrument, and was thereby set into vibration. Behind it was a fine metal point or style, which vibrated to and fro with the diaphragm; and under the style was a sheet of tinfoil, smoothed over a revolving barrel, so that as the style vibrated it indented the tinfoil along a spiral line. This line of indentations was a print of the vibrations of the diaphragm, and consequently of the voice or tune. But it was, from the very nature of the foil, a very imperfect record of the vibrations, and hence, when it was used to set another diaphragm in motion, by a reversal of the process, the sounds

emitted by the diaphragm were a mere parody of the original sounds which made the record.

In the 'perfected phonograph,' Edison employs a cylinder of wax to receive the indentations of the style. Beeswax, specially prepared, is capable of taking an accurate print of the vibrations, so that when the style traverses it again, the print, reacting on the style, sets the diaphragm to which it is attached into corresponding vibration, and hence the air in front of the diaphragm is made to vibrate with a reproduction of the original sounds. By the aid of a wide-mouthed funnel, the reproduced sounds can be rendered audible to a roomful of people; but for private purposes the sound is conveyed to the ear by a flexible rubber tube with two ear-pieces.

On applying these tubes to the ear we are at once struck with the remarkable loudness and fidelity of the reproduction. A wax cylinder containing the record of a piece of music played on the piano in America at Edison's laboratory is put into the phonograph. We hear the music as though it were being played close at hand. Nevertheless, the actual music was played two thousand miles away and several weeks ago. A cornet solo, a concert of violin, piano, and cornet, are put into the instrument, and we enjoy the music with a curious feeling that it is magical and supernatural. Another cylinder containing the wailing of a baby, which a workman held over the phonograph in Edison's laboratory, is put in operation, and we listen to the infant's protest against things in general. Then we hear a dialogue between Colonel Gouraud and Mr Edison, spoken in the laboratory of the latter three weeks before. Edison wishes his friend to correspond with him in future by phonograph. The Colonel replies that he shall be happy to be spared the trouble of writing, and Edison rejoins that he will also be happy to be spared the trouble of reading the Colonel's letters. At which they laugh, and we can hear them now. Every hesitation or stutter, or cough or accentuation of the speech, is given; and if the phonograph is ever used for diplomatic correspondence, it will behave the diplomatists to be very careful of their expression, if they do not wish it to belie their actual thoughts and words.

In matters of less moment, correspondence by phonograph will teach people to improve their articulation and to cultivate elocution. The use of the telephone has shown that many persons are not only bad hearers but bad speakers, without knowing it. The use of the phonograph will tend to show it still more, and Mr Edison seems to think it will have a moral influence in making people careful what they say, not merely how they say it. Certainly, if phonographs are to be admitted as evidence in law-courts, it may be so. But will it add a new terror to life, like the electric bell and telephone or the detective camera? Shall a visitor have to be careful what he says in a friend's house, in case there is a phonograph concealed about the room? It is hardly likely, for, as it is constructed at present, a fair amount of

impulse in the voice is required to produce the indentations in the wax, and hence it is necessary to be near the apparatus in speaking. What may yet be effected in this direction it is, of course, impossible to say, for obviously such an instrument is capable of almost infinite improvement. Even now Edison is engaged in perfecting it still further. Nevertheless, it is now a practical apparatus, capable of doing good service.

It can be used for dictating letters or instructions, so that a clerk or secretary can copy them out at his leisure either in longhand or by a typewriter. It can be used for direct correspondence by phonograph, the wax record being put into a small wooden box, devised by Edison for the purpose, and posted to any part of the world, where, on the record being put into another phonograph, it gives out the original words as spoken. It can be used by an editor or journalist in dictating his 'copy' for the printer, who, with the ear-tubes of the reproducing diaphragm fixed to his head, can set up the article as it is spoken to him and at his own pace. Mechanical devices are attached to the apparatus by which he can take one word at a time, or go back and have a word repeated if he fails to catch it. Everything is being done by its inventor to make the phonograph as useful and handy as possible.

As to music, the phonograph can be utilised by musicsellers in their shops. If a customer wishes to hear a new piece of music before he buys it, the seller need not play it over. It can be impressed on one of the wax tablets and put in a phonograph, where the customer can listen to it at his leisure without disturbing the other business of the shop. A great variety of such pieces can be kept on hand ready for use; and the same tablet can be used over again a great number of times without the record being worn. Moreover, Edison makes copies of the wax record in metal by an electrotyping process, and thus provides metallic tablets which are proportionately enduring. Probably the day is not far distant when such metallic tablets will be placed in the foundation stones of buildings along with coins and other monuments of the age, to tell in spoken words to future generations the story of the building. The ancient Assyrians impressed their cuneiform characters on cylinders and tablets of baked clay; we have now reached a period when the vocal form of thought itself can be impressed on cylinders of wax, and the living speech be as it were resuscitated. The Egyptians kept their mummies with them in their homes, and painted the likeness of the dead upon the mummy case, as though to banish the idea of death and separation. We are now able, through the phonograph, to preserve the sounds of voices that are still—the very accents of our friends, as we preserve their likenesses.

The uses of the phonograph are in fact endless. Mr Edison proposes, for example, to issue phonographic books which can be *spoken* to a listener with all the arts of elocution and without the strain of reading. For invalids this will be a special boon. Sermons, lectures, dramas, and orations can in this way be sent by post and delivered in out-of-the-way homes. Musical recreation can be indulged in by lonely bachelors who cannot play. Composers can seize their improvisations without trouble, and cabinet coun-

cillors record their secret meetings. Moreover, the phonograph gives us the 'giftie' of hearing ourselves speak as others hear us, though we are still unable to see ourselves as 'ithers see us.'

THE BURNING OF ALLINGSFORD HOUSE.

ALLINGSFORD HOUSE was not very old, nor was it particularly beautiful; at least the late Allingsford House, which is the one I am speaking of, was not. But, on the other hand, the Park was one of the noblest in England, and contained some splendid shooting. The kennels, also, at no great distance from the House, were renowned both near and far. The enormous trout caught in the Alling, which ran through the Park, were often mentioned in the *Field*, and had furnished many a day's work to the local taxidermist. Add to this that the House was built of red brick and fully insured; and perhaps you will not feel so very much horrified when I ask you to come with me and burn it, for that is what I mean to do.

Remember, what a godsend it will be to conversation at local dinner-parties for the next six months. What a story for mine host at the *Eagle* in the village to tell for the rest of his life. Then think of the new quarry at Cutstone, which has just started working; and of young Mr Smith, the scientific architect, who has scarcely had a single job since he designed the Town Hall so successfully two years ago. I admit that, as a rule, burning down family mansions is not a nice thing to do, and least of all at Christmas-time; but I think that you will agree with me that in this case the circumstances render the act justifiable.

It was Christmas Eve, and most of the guests had gone to bed, for, indeed, it was long past twelve o'clock. But Sir John and his brother Colonel Allingsford still remained in the smoking-room, chatting over a last pipe and tumbler of toddy.

'Well, it's his own fault,' said Sir John. 'He's had as good a chance as a man could wish for, after dinner, alone with her in the conservatory for nearly a quarter of an hour, the thermometer standing at eighty-five. If he couldn't pull himself together to propose then, all I can say is that he never will. The boy ought to be ashamed of himself.'

'Yet the youngster is worth a dozen of the puppies one meets nowadays,' replied the Colonel. 'I shall never forget the day he got his V.C. at Ashallan Gasha. I fancy I can see him now, falling back on our zereba with scarcely twenty men, and those two Krupps they had taken out of the Arab fort. Most fellows would have left the guns when that ambush attacked, and small blame either. Not so Harry; he knew that if the rebels got them back, they could have given us the very deuce of a time of it till reinforcements came up; so he stuck to them like a man; and brought them in safely too!'

'Why doesn't he ask our niece to marry him? Any fool can see that he wants to; and I know that Nina wants to, and we all want them to. Now, if I were dead against the match, it would have been over and finished long ago. Then the girl won't help pull him on either; she ought to flirt with young Jervis.'

'Well, well, Jack; these things have a wonderful knack of coming right when we least expect. Anyhow, I can't see how our talking half the night will improve matters. It's a quarter past one; I'm off to bed.'

So, after the master of the House had satisfied himself that all the fastenings were secure for the night, the two fine old brothers strode up-stairs together, candlestick in hand.

'Jack, I believe that window on the stairs is open; I feel just like sneezing;' and the gallant Colonel pulled out his handkerchief and with it his pipe, which merrily gambolled down two flights of stairs, and then, to judge by the sound, shattered itself on the hall stove.

'My old meerschau gone at last!—Never mind. I hope no one trips up over the stem to-morrow morning.—Good-night, Jack.'

'Good-night.'

Their bedrooms were both on the first floor; and in half an hour's time, as befits healthy old gentlemen with clear consciences, they were both fast asleep.

More than was Captain Henry Melville, who had been feverishly pacing his room for the last hour, hardly knowing what he thought of or what he did. Promoted out of his turn for distinguished service, he was the youngest captain in Her Majesty's army, and with his slight figure, clear skin, and the very smallest attempt at a moustache, looked a mere boy. Though no relation of the Allingsfords, he had been known to both brothers from his childhood, and was now in the last week of a long visit to their house. Two months before, he had found that he was looking forward to this visit with especial impatience, though not for one minute would he have admitted it. Now that it was nearly over, there was no concealing from himself that he was head over ears in love with Nina Darlington, the Baronet's niece. But however brave he was in the field of battle, Master Harry in this affair showed a lamentable want of courage.

Nina was an heiress, while Harry's fortune was all in Chancery; that is to say, there was no telling whether it was his fortune or somebody else's. He thought that to push his suit would be to betray Sir John's kindness. Who was he, a penniless captain in a regiment of foot, to marry Nina Darlington, heiress to one of the finest estates in England? It had always been a joke in the regiment that though Melville was the 'best fellow that ever stepped,' he could never be brought to think himself anything but a fool. Even when he got his V.C. it did not seem to him that he had done anything particularly brave: he had done his duty, and so would any of the other fellows. Hence, to such a modest temperament, it seemed the height of presumption to hope that Nina would ever come to reciprocate his affection; while that she did so already never occurred to him.

Poor fellow, he was really to be pitied; the last few days he had looked quite ill, taking long

walks by himself, and seeming in society, as one of his friends expressed it, 'as nervous as a cat.' And yet, such is human blindness, he never suspected that his indisposition was noticed or the cause guessed by his host or any one else. So he paced his room up and down, up and down. He would cut his visit still shorter and leave early in the morning the day after Christmas Day. He would volunteer for the Egyptian army and get killed in the Soudan. Or he would offer to carry despatches to Emin and be caught by dervishes and put to death by torture, which would be very nice and very agreeable; but neither Nina nor her guardian should ever hear of his hopeless passion.

Let's leave this young man, who is very bad company and making a great ass of himself, and come up-stairs. Up, up, up, past the second story, along this little passage, up the old corkscrew stair to the little turret room. Hush! tread gently, for the occupant of this room has had the sense to go to sleep, like a prudent girl who wants to look her best in the morning. Light the candle and we will see how Miss Nina has been amusing herself before she went to bed. Her sketch-book and pencils are scattered about on the dressing-table, so she must have been drawing; and, to judge by the litter in the fender, she seems to have torn her drawing up into very little pieces and burnt most of it. Luckily, I was looking over her shoulder all the time, so I can tell you what she drew. First, she drew a young man on horseback; then she turned the paper over, and drew another young man in knickerbockers and a Norfolk jacket, with a gun on his shoulder. Then, taking a fresh piece of paper, she drew a third, in a patrol jacket and regulation boots, with a drawn sword in his right hand, while with his left he seemed to be frantically calling to some one behind him to come on. Oh! of course, we can see it all now. They are all meant for the same person, and that person is Harry Melville; but he's not nearly so tall or so well proportioned as you have drawn him, Miss Darlington; he's not, really.

Just now, she is dreaming, dreaming that she is looking at Millais' famous picture 'Yes.' She wonders why she never before appreciated it so much, and sits down in front of it. Soon she wonders what makes the place so terribly hot. Then she fancies that every one who passes is looking at her, and is even certain that people at the end of the room are pointing at her. Then she saw some one point her out to an attendant, who forthwith accosted her: 'Beg pardon, miss, but you're sitting on the stove. It's made just like a bench; but it's a stove; and my horders is positive that no one sits on the stove.'

Nina thought that this was really too bad, and fairly lost her temper. 'It's not right,' she said, 'to make the stoves so like the seats, if you don't want people to sit on them; but I knew what it was, and came here because I was cold.'—'Oh!—' 'And I'm going to stay here as long as I choose.' And disdaining further argument, she took out her catalogue and pretended to be engrossed in its perusal.

Very soon she could feel the heat under her beyond a doubt, and most unpleasantly. But so obstinate are young ladies in Dreamland (in practical life they are 'firm'), that she determined

to stay where she was for a full five minutes by the clock. Three minutes; the actual heat was not so great, but the fire underneath her was beginning to smoke. Then she thought that all the bystanders, and among them all the people she disliked, were saying that she would never stay there another two minutes. Four minutes; it was worse. Four minutes and a half—four minutes fifty seconds; it was stifling—at last! and she woke up with a start.

What a terrible smell of smoke; her dream had been founded on fact. The house must be on fire. Lighting a candle, she ran to the door and looked down the winding stair, when suddenly some one threw open the door at the bottom of it, and a great curling cloud of terrible blue smoke, but showing lurid behind, rushed up through it, causing Nina to drop her candle and run coughing and trembling back to her room.

The Colonel's meerschaum was a big pipe, and he had forgotten to knock out the ashes, so that, though it had been in his pocket for nearly five minutes, it was still just alight when he dropped it. When it hit the stove it snapped in two. The stem fell into the grate, but the bowl, after rolling along the oilcloth, ultimately 'fetched up' behind the umbrella stand. Here, I am sorry to say, Mary, the under-housemaid, was in the habit of keeping a little bundle of woollen and chamois cloths, greatly besmeared with beeswax and turpentine, together with a lump of the former and a bottle of the latter—materials which she used for cleaning the front staircase and the polished woodwork in the hall. Some lighted ash fell on these cloths and soon begat a slow and smouldering fire. However, as there was very little draught in the hall, and the umbrella stand stood on a slab of polished granite, all might yet have been well; but it was fated otherwise.

When the rags had been smouldering quietly for about half an hour, and seemed in a fair way to burn themselves out, a big rat, taking a constitutional in the vicinity, attracted by the smell of burning beeswax, came to see what was the matter. Naturally burning his nose, he whisked away in great wrath, and so upset the turpentine bottle, to which there was no cork. In an instant the floor for a yard round was covered with burning spirit. There was nothing to stop the flames, which caught first the umbrellas, then the hall table and the woodwork of the stairs, and then the wainscoting, and anything and everything that there was to catch.

Harry Melville was the first to give the alarm, but too late for the slightest hope of extinguishing the flames. In fact, when once a large house, dry and airy, and largely fitted with woodwork, has fairly caught fire, a dozen engines cannot put it out before it is thoroughly gutted from basement to attic. The front staircase would soon be impassable, so that when the guests were roused the only thing to do was to lose no time in saving the women and themselves. When Harry saw this, his first thought was for Nina, and he tore up-stairs with the flames literally at his heels. It was he who opened the door at the bottom of the corkscrew stair, admitting the volumes of hot smoke as they rolled fiercely upwards. He saw her, candle in hand, when she fell back

blinded and coughing; the next moment he had her in his arms. He thought that there was still time to make a dash for it down the fiery stairs; it was the only chance to save her life. One moment to wrap a blanket round his darling as a protection against the hungry flames, and then for the rush. Whether he lived or died afterwards did not matter, if he could only struggle on to the bottom, where other hands would be ready to take charge of his precious burden. That moment's delay saved both their lives; for just as he snatched the blanket from the bed, when, if they had started at first, they would have been half-way down the first flight, came a bang! crash! as with a deafening noise a portion of the outer wall of the room and the whole of the corkscrew staircase fell, while the whole building shook. In the gunroom, on the second floor, were kept the stores for refilling empty cartridge cases, which included two large flasks of meal-powder which had come from London only the day before. These, as well as several hundred full cases, had exploded and caused the damage. Retreat by the staircase was now impossible. Under the window was a sheer drop all the way to the ground; a monkey could not have saved himself there.

The explosion had had one good effect, for, in blowing out all the windows, and even part of the outer wall on that side, it allowed the wind, which was blowing fresh, to take most of the smoke and heat over to the other part of the house, otherwise they must soon have been suffocated. They were standing together in the corner by the door. Though her feet were on the ground, Nina was still in his arms, with the blanket round her, as when they were going to start for the dash down-stairs.

'God help us, my darling!' said Harry. This was the first time that either of them had spoken.

For all reply she pressed his hand and turned her face calmly and trustfully up to his.

Had it been Harry's last second on this earth, and he conscious of it, he could not have helped kissing her then.

'Forgive me, my darling,' he said hoarsely; 'but I love you with all my heart.'

'And I love you with all mine,' said Nina simply. Then suddenly she cried: 'Quick! There is a trapdoor in that corner; you can reach it by standing on the drawers.'

Needing no second bidding, he leaped up on to the drawers, and having felt for the trapdoor, struggled with all his might to open it. It was fastened on the inside with a bolt, which from long disuse had become completely rusted into its socket. Twice he put forth all the strength he could get to bear on the little knob, only to lacerate his hands without being able to stir the fastening. As he gathered himself together for a third try, Nina thrust a garden hammer into his hand. It was a small but fairly heavy one, which she used for nailing up the creepers. A few blows with this, another pull, the bolt yielded, and Harry threw back the trap. Sitting in the opening, he pulled Nina up to his own level, and they were both on the roof.

Except for a little gable in the middle, the roof was flat. On one side and under the turret was the blazing house; but on the other, some

twenty feet lower, was the roof of the laundry, which, being to windward, had so far entirely escaped the conflagration. A waterpipe, standing out about two inches from the wall, took the drainings from the gutter round the turret to a small rain-water cistern fixed against the wall just above the laundry. It was down this that they must go.

To climb down twenty feet by a small waterpipe, with only one hand and your legs to hold on by, and to support a lady with the other hand, is no easy feat, even for a strong man and an athlete, and Harry was neither. But love and desperation gave him both strength and skill to perform the descent safely. Only when, about half-way down, first his legs and then his hand came into contact with an iron support to the pipe, did he feel a momentary pain. And no wonder, for passing through the wall and being clinched on the inside, it was nearly red-hot. A great tongue of flame shooting out from one of the side windows enabled those below to see what was happening. A ladder was placed against the laundry wall, and amidst lusty cheers they were quickly half helped half carried in safety to the ground.

Thanks to the blanket, Nina had escaped nearly scot free; but Harry Melville was badly though perhaps not dangerously hurt. His left hand in particular was terribly burned. The doctor was amongst the lookers-on, and ordered him to bed at the *Eagle* at once, while he himself hurried off for the lotion and other necessaries to dress his wounds.

The ladies were accommodated with beds or 'shakedown' at the vicarage; the gentlemen had plenty to do in helping their host and his servants. Of course next to nothing could be saved from the house; it was enough to be thankful for that no lives had been lost. The horses were blindfolded and led away; the carriages and harness were also saved. Then it was decided to destroy a great straw stack, lest the wind should shift and the fire be communicated to that and thence to the lodge. By this time all the village was afoot, so that there was no lack of hands. A groom had been despatched for the fire-engine at the first alarm; and meanwhile a couple of garden hose were played on the fire, but without any appreciable result. About dawn, the engine arrived, and commenced operations on the slowly subsiding conflagration. Though it was kept only four miles from Allingsford, the 'man who understood it' slept nearly six farther on, whereby, as the obstructionist town-councillor observed at the next meeting, 'considerable time was lost.' It was broad day ere Sir John, his brother, and guests, having done all that men could do, and thanked the villagers for their willing help, both verbally and practically—this last by having a cask of treble X broached in the yard—drove off to Lord Grandworth's, who had placed his house at their disposal.

So it came about that the Baronet spent his Christmas morning in bed. In the afternoon, he rode over to see Harry, calling at the vicarage on his way. Here, clad mostly in dressing-gowns, the ladies from Allingsford House received him in remarkably high spirits, notwithstanding that they had lost all their possessions. Only Nina, in one of the vicar's daughter's dresses, accom-

panied him to the ruins, which were still smoking sulkily. It was not an inspiring sight, and they soon turned their steps in the direction of the village. Dr Brown met them at the door of the inn with a grave face, and said, in reply to Sir John's inquiry after his patient: 'Not so well as I could wish, by any means; the burns were bad enough, and now a fever has come to complicate matters. He seems to have a splendid constitution, though, and that's half the battle. I shall telegraph to London for a nurse, and we ought to pull him through in a fortnight.'

'But what shall you do till the nurse comes?' asked Nina.

'That,' he replied, 'is just what I was coming to. Can you spare me Mrs Hickley?' (Mrs Hickley was the housekeeper). 'She can be depended upon, and will be able to carry out my intentions better than the people at the inn.'

'Take her and one of the maids too, doctor, if you like,' said Sir John.—'Nina, you go and see about it.'

'Shan't we send a message, uncle?' said Nina. 'Then you and I will wait in the *Eagle* till they come; and if anything is wanted, I can do it.'

'Perhaps that would be best,' said the doctor. 'I am going to the vicarage, and will be the messenger myself. But first come up and see him.'

They entered the inn, and went up-stairs to the sick-room, the doctor leading the way. As he opened the door he held his finger to his lips, as a sign for them to be silent. Captain Melville was sleeping soundly.

'Splendid!' said the doctor, as soon as they were outside again. 'But I take no credit to myself. A good constitution, that's what's done it. If he only sleeps on for a couple of hours now, he is as good as cured. Now I must be off. There is some soup being made for him down-stairs. He ought to have it the moment he wakes.—In fact, Miss Darlington, I think that the best plan would be to keep it in the room, on the hob.'

'Uncle,' said Nina, as soon as he had gone and the landlady had been despatched for the soup.

'Yes, my dear.'

'Captain Melville has asked me to marry him.' It was lucky that they were not in the sick-room, for Sir John's long-drawn 'Whew!' would have most assuredly waked the invalid.

'And pray, when was this arranged?'

'Last night.'

'In the conservatory?'

'No.'

'During the fire?'

'Yes.'

'And you said?'

'Yes.'

'And suppose I say no?'

'But, uncle, you won't say no.'

'Oh, well, since you seem to be of that mind, I suppose I had better not. Give me a kiss, you solemn little rogue, if they are not all bespoken. Ha, ha, ha! I think that I must leave you in charge here, and go and tell George. He said last night that these things had a wonderful knack of coming right. This is the best piece of news I've had for many a long day.' And as

the Baronet walked back to the rectory, all who met him remarked how well he carried his misfortunes.

Nina was very happy, sitting at the fireside, musing and watching her lover's sleep, now sound and healthy, a sure sign that the fever had gone. There was something very strange about it all, and she could scarcely believe that she was the same girl who had gone to bed in the turret room the night before. Presently, Mrs Hickley arrived, and told her that her uncles were coming to fetch her in the rector's pony-cart.

Still Harry slept, though now his sleep seemed lighter. At length he turned lazily on his back, opened his eyes and said 'Nina.'

'Not a word till you've had your soup: here it is, all ready. Give it to me, Mrs Hickley.—And now you must have another pillow under you; so!—Now, I'll hold the basin, and if you're strong enough, you shall feed yourself.'

'But Nina'—

'Silence, sir! Obey orders.—Why, here come both my uncles; I'm sure it's their voices we hear. Oh, Harry!'

'Yes, darling?'

'I've told them.'

Captain Melville's illness did not last very long. He was moved to Hill's farm on the third day; and could get up in about a fortnight. Soon after that he rejoined his regiment. I may mention, by the way, that while he was in bed he got a long letter from his solicitor stating that some missing papers had just been found in the lining of a safe which established his claim to the property in Chancery beyond a doubt; and promising that in two or three months at the most he would enter into legal possession.

The banns were put up on the first of May, Sir John having an old-fashioned dislike to licenses.

Living with two good-tempered old gentlemen, of course Nina escaped the lectures and endless advice with which maiden aunts and married friends so love to load a girl who is going to embrace the fetters of wedlock. True, the Colonel did try his hand one evening, beginning by recounting some of his experiences as a mess caterer, and ending by saying: 'I hope also, my dear, that you will let the unfortunate accident which occurred at Christmas be a warning to you never to allow your maids to lie awake reading after they have gone to bed. Of course, Mrs Hickley assures us that such a thing was never done at Allingsford House; but there is not a shadow of a doubt in my mind that that was how it came about.'

'It might have been one of the men smoking.'

'Tut, tut! my dear; that is perfectly impossible. You cannot communicate fire to anything from the tobacco in a pipe. No, no; you may depend upon it, it was one of the maids reading in bed.'

The marriage was celebrated in due course amidst general rejoicings. Many were the blessings fervently bestowed on the young couple by the honest rustics at the church door; and many a horny hand did Harry shake on that eventful morning; for his bravery at the fire, and his genial frank disposition, had completely won the villagers' hearts. Nina they had always loved.

Old Sir John's voice trembled a little as he wished them good-bye; and the Colonel's eye-glass was very misty as the brothers stood together on the steps watching the carriage disappear down the drive.

'She couldn't have done better,' said the Baronet.

'No, Jack; she couldn't.'

THE DACCA TORNADO.

A SEVERE tornado, or whirlwind, burst upon the ancient city of Dacca in Eastern Bengal on the 7th April 1888, causing great destruction of life and property. The diameter of the vortex of the whirlwind was not more than two hundred yards, as it violently rushed along in an almost semi-circular course. Dacca stands on the east bank of a river about half a mile in breadth, and the city extends for more than three miles along the river-bank. The tornado struck the city at the north-west end; it then went westward across the river, destroying many boats. Suddenly it turned, and came back eastward over the river about a mile below the point at which it had first crossed; and after wreaking its fury on the palatial residence of the Nawabs of Dacca, it made away to the east and was lost in the open country.

Those who have seen a tornado know how it marches onward irresistibly, with an internal rotary motion, just as a top when spun advances over the floor, whilst all the time it is rapidly revolving on its own centre. Whatever objects are caught at the bottom of the vortex are violently twisted and torn. The walls of houses are crushed, the thatched roofs are broken into fragments, and, with branches of trees and all other movable things, are whirled upwards, and ejected from the top of the moving vortex with extreme violence. Human beings and cattle are crushed and suffocated; but sometimes the light body of a child or of a dog may be carried upwards in the pillar of wind and projected from the top of it. A tornado is not unlike a waterspout in appearance; but whilst the former is a moving column of wind and dust rising from the earth, the latter is a circling pillar of water descending from a cloud and destroying everything by the violence of its deluge.

The tornado at Dacca seems to have come on almost without warning. There was the ordinary evening appearance of a bank of clouds in the west, which usually bring on a 'nor'-wester,' as it is called, at that period of the year, with thunder, lightning and rain, such storms being heartily welcomed, as cooling the air and purifying the atmosphere. When the tornado developed itself, its dimensions were so limited and its course was so erratic that many people knew nothing of the fearful havoc and ruin which had occurred within a short distance from their own houses. All along the track of the storm, the native huts, built chiefly of bamboos and thatching-grass, were wrecked and unroofed. Where the tornado en-

countered any brick buildings it made short work of them. The ruinous old houses crumbled before it. The greatest fury of the storm seemed to have fallen upon the palatial residence of the Nawabs of Dacca, which stood conspicuously on the bank of the river. The tornado got hold of it and into it, and in the course of two minutes the greater part of the building was reduced to a mass of ruin.

Several curious cases are reported, chiefly on native authority, which serve to show how narrow were the limits within which the tornado revolved in its headlong course. For instance, at the old Mohammedan palace called the Lal Bagh, which was the first point attacked by the storm, a native police inspector was knocked down and killed on the high ramparts which face the river; whilst an old man who was fishing in the reservoir in the palace courtyard, not a hundred yards distant, sat quietly over his rod and line, unconscious of the havoc that was going on, though he said that he thought he heard the rumbling of a railway train of many carriages. A few years ago a barbarous Englishman vested with official power pulled down the ruined battlements of the beautiful old palace, which had been the residence of the native governors of Dacca two or three hundred years ago, and he built up some ugly police barracks on the ramparts, because the site was cool and airy. Perhaps the unfortunate policeman killed by the tornado may be regarded as a victim to Nemesis, for the desecration of the picturesque ruins of the old palace. Another story tells how a poor woman had left her two-year-old child in her hut whilst she went to the neighbouring street to buy some rice. The tornado levelled every shop in the street, and the unfortunate woman was knocked down and severely injured. When she recovered her senses, she struggled to get home, and great were her astonishment and delight to find that her hut had been outside the vortex of the tornado and that her child and all her little worldly goods were safe. Unhappily, there were too many cases in which the reverse of this occurred. Men and women who had gone out to buy provisions for their evening meal found themselves safe and sheltered in some street which the storm spared; but when they got back to their homes they came upon a scene of desolation—their huts blown to pieces, and their children maimed or half-buried in the ruins. One English gentleman, a Professor in the College, was seated in his study when he heard the roar and rush of the storm, and on looking out he saw his thatched stables at the end of his garden whirling away into mid-air, whilst his terrified horses galloped wildly in the distance. The stable was little more than fifty yards from the house, but the house was luckily beyond the reach of the tornado.

The city of Dacca, like other Indian towns of similar antiquity, contains many old ruinous brick-built mansions, which were once occupied by wealthy natives. But almost each new generation, instead of repairing the old family house, sets to work to build a new mansion for itself, the old dwelling being left to fall into decay. This gives a melancholy and broken-down effect to an old town, and the tornado may have been useful in demolishing a few of these dismal old ruins that came in its path. But so violent was the

fury of the wind that it destroyed new buildings as well as old ones. The police barracks at the Lal Bagh, which have been already mentioned, were substantial brick-built houses of one story with tiled roofs. There were six of them in a row along the ramparts: three of them were left untouched; the other three were destroyed. The wind got in through the doors and windows; it tore off the roof and knocked down the walls, which fell outwards; whilst the arms and accoutrements of the men, with the scanty barrack furniture, were whirled aloft into the funnel or vortex of the tornado. In another part of the town the storm attacked the Lunatic Asylum, a large square of one-storied buildings, surrounded by a brick wall twelve feet high. One side of this wall for the length of a hundred feet was laid flat in an instant. Fortunately, the lunatics, many of whom are imbeciles, were locked up in their wards for the night, and the doors and windows being closed, the wind could not get inside the buildings, and no serious damage was done to them.

Far different was the fate of the palace of the Dacca Nawabs. These worthy gentlemen, father and son, have recently received their titles from the English government. They are exceedingly wealthy, and are famous for their charity and liberality. They had almost entirely rebuilt their family mansion, converting it from an ordinary dwelling-house into a palatial residence. A broad veranda two hundred feet long, with arches on the lower story and a row of massive pillars in the upper story, faced the river towards the west. A handsome marble flight of stairs led from the garden to the upper floor. The house was in the form of a quadrangle enclosing a courtyard. The tornado in its return across the river came right upon the western veranda. Most of the doors and windows of the palace were open, to admit the cool air of the evening; thus the whirlwind seems to have got inside the house and to have upset and destroyed everything. The massive pillars of the veranda were blown down as if they had been reeds; the roofs of many of the most exposed rooms were burst through as if they had been made of paper. The Nawabs themselves were sitting in a room in the north-west corner of the house; the doors were burst open by the tornado and the roof was rent in twain. An old servant who was with them was killed by a falling beam, but they fortunately escaped unhurt. Several other domestics were killed and wounded in other parts of the house; and one of the horses in the stables was so much injured that it had to be destroyed.

In the official reports of the police, the loss of human life was calculated from the one hundred and eighteen bodies which were dug out of ruins or otherwise discovered on land. But there is reason to fear that many more persons perished, as a number of large and small boats, with their crews and passengers on board, were wrecked and sunk at their moorings, when the tornado twice crossed the river. Dacca has been called by some oriental travellers the Venice of Bengal; whilst its broad river and the channels that intersect the town are almost always crowded with boats, some of which come from remote parts of India, so that nothing is known about their crews or passengers when they are lost.

The police returns showed that twelve hundred

persons had been found who had been wounded during the storm. Of this number two hundred and twenty persons were so seriously injured that they were at once taken to the Mitford Hospital, a noble charitable institution, founded and endowed about thirty years ago by Mr Mitford of the Bengal Civil Service. Two hundred and forty-eight wounded persons were treated at their own houses by the Civil surgeon and his assistants for the injuries they had received during the storm. The rest of the sufferers had their wants attended to by the native doctors of the town.

The damage done to property was estimated by the magistrate of Dacca at seventy thousand pounds sterling. Nine large brick-built houses were completely demolished, and one hundred and forty-eight were severely damaged. Of the mud and bamboo huts and shops occupied by the natives, three thousand five hundred and eighteen were completely destroyed, and many more were much damaged. One hundred and twenty-one large boats, a much greater number of small boats, and a small river steamer belonging to the Nawabs, were wrecked and sunk.

A subscription for the relief of the poor sufferers was at once set on foot, and the Nawabs of Dacca headed the list with the sum of one thousand pounds sterling, notwithstanding their own serious losses from the storm. The English officials and the other English residents were not wanting on the occasion; and with their purses, as well as by their untiring personal exertions, they did all that was possible for the relief of their unfortunate native brethren.

AN HOUR AT THE STATION.

WE have missed our train, and learn with dismay that there will not be another to our destination for an hour; and as it is pouring rain, we must make the best of the time under cover of the grimy glass roof of the station. Our compliments to the enterprising proprietors of the Automatic Weighing and Toffee Supply Machines; their engines have converted this Palace of the Winds into quite an interesting field of study, exhibiting, as they so often do, the personal character of their patrons.

A train is to leave in a quarter of an hour, and intending passengers are dropping in, and look round for means to kill time until they can take their seats. Here comes a portly old gentleman, marching pompously down the platform, laden with the usual paraphernalia of rug, bag, umbrella, and newspaper. The staring face of the weighing-machine catches his eye, and he pauses. Surely that staid dignified Briton—an opulent banker he must be, at least—is not going to ‘try his weight;’ one would think such a matter had lost importance at his time of life. He is, though, but is shy about doing it so publicly, for he glances furtively round before drawing nearer the machine, and then strolls up to read the instructions through his gold-rimmed *pince-nez*. Another look, to see nobody is watching, and he lays his rug on a convenient seat and steps on to the little iron stand, searching pocket after pocket eagerly for the required penny. He is fumbling through a handful of change, when the doors of the refreshment room swing open and

four or five travellers issue therefrom. Our old gentleman starts guiltily, and reddens with annoyance as they take up a suitable position to watch the hand of the dial. Where on earth is that penny? He can’t find it, and stands there head and shoulders above the gradually forming group of idlers, clearly more than half inclined to give it up and seek the seclusion of the waiting-room. He must feel painfully conspicuous, for the bystanders are interchanging remarks on his probable stones *avoidupois* with an outspoken candour that is obviously embarrassing to him. Ah, here’s the penny at last, and—

‘Shall I ‘old yer bag, sir?’ says an officious young porter with a smile of sympathy.

The unhappy old gentleman turns sharply, and misses the slit with his coin, which jangles down the platform pursued by the officious porter aforesaid.

‘Ere y’ are, sir; lemme putt it in, sir.—*There we are.* Fourteen, fifteen, sixteen (wait a bit, sir). My heyes! eighteen stun six pun’, sir,’ says the self-appointed Clerk of the Scales to the exasperated patient in a congratulatory tone, whilst he casts a measuring eye over the form leaving the stand. The lookers-on repeat the weight in reflective under-tones, as the abashed old traveller recovers his property from the seat, and strides through the crowd with an assumption of non-chalant dignity comically out of keeping with his heated countenance. He won’t weigh again at the station, I suspect.

A jovial old farmer comes next, laughing uproariously with a friend at the humour of the thing. The penny is fished up from the depths of a leathern purse, and the farmer takes up his position facing the dial, hands upon knees, with a face suddenly grave; whilst his collic, seated before the machine, watches the rapidly travelling hand as intelligently as though appointed by his master to take a note of the weight.

‘Haw, haw, haw!’ chuckles the old fellow, rising to the perpendicular and facing the crowd. ‘Ah’m na sae light as when I wur a lad. Hee, hee!’

The gratified spectators smile pleasantly, thinking, perhaps, that if he *had* scaled close on sixteen stone when a boy, he must have been a remarkably fine one.

‘Haw, haw! ah’m a deal heavier, a deal heavier,’ he repeats pensively, and with this sage reflection he disappears into the refreshment room to recruit.

A middle-aged country-woman, planned on a generous scale, with a good-humoured red face, a blue shawl, and particularly obtrusive laced boots, stops near the machine with a young woman, who, like herself, is laden with parcels. A short whispered conference, and the elder lady transfers about nine many-shaped packages to the arms of the younger, then grasping her skirts, she sweeps boldly on to the weighing-stand, wreathed in fat smiles of cheerful anticipation. The lookers-on stare in respectful silence, but dodge and duck and try in half-a-dozen uncomfortable attitudes to read the weight. But the good lady’s ample form is its own protection, and the tell-tale pointer’s secret is seen by none save the young woman, who peeps below her aunt’s elbow, and after some calculation and counting, arrives at the correct

sum, which she communicates in an awe-struck whisper to her expectant relative.

So they come and go: the young man who 'tries his weight' with a business-like decision that shows he does it every day on principle; the sociable man of twelve stone seven, who knows his weight and isn't ashamed of it, and exchanges jocular remarks with the lookers-on; the bashful man, who won't weigh if he thinks any one is looking; the doubtful sceptic, who stands and tries to jerk the pointer into making him out a pound or two more or less, and goes away grumbling; the two small boys, who get on together to save a penny, and tumble off the scale in shame and confusion of face at the distant apparition of a porter. The pennies rattle all day into the insatiable slit to gladden the hearts of shareholders. Ladies don't weigh often; but they attract such a degree of attention when they do that we are not surprised at it.

Why do all the children who patronise the chocolate and toffee engine suck their pennies with such emphatic earnestness before they drop them through the slit? Is it anticipation or doubt? Impossible to say, but it is their invariable practice. See that chubby urchin with the roving eye and a mouth made for the mastication of sweetmeats; he is not quite sure about the nature of the contrivance before him, and is by no means certain that it may not play him a trick. Awful prospect for the small boy who has treasured up that copper ever since yesterday to spend in this way. Suppose the machine should be out of order! Suppose the drawer marked 'Pull' should stick! With a troubled frown on his infant brow he spells through the directions, takes the coin out of his mouth, stares at it, to assure himself that it is a penny, and not the 'two halfpennies' that will produce no result; and at last lets it go.—That's right, youngster; grab the toffee and run. We think he has a vague idea that retribution in some mysterious form will overtake the adventurous boy who compels the machine to disgorge its treasures.

The sturdy little boy who is the next customer is much bolder in his dealings with it. The flicker of a smile that crosses his features as he approaches is nothing more than the greeting of an old friend. He is on terms of intimacy with the engine, and makes his purchase without the least hesitation, as soon as he has made up his mind (by sucking his penny) which sweet he will have.

A clean-looking little girl with a handbag is evidently a stranger, for she looks the whole machine over shyly, and reads the directions through twice before she attempts to find the slit. No; she never did such a thing before; she takes her purchase out of the drawer, and recloses it, murmuring 'Thank you,' by sheer force of habit. A well-mannered little girl, but a trifle absent-minded.

Materfamilias with four small boys, who range themselves in a circle round the machine. The parent takes up her stand beside it, and having collected four coppers from various receptacles, asks each child in turn what it will have with a degree of asperity that seems quite gratuitous and uncalled for. They have lots of time to make up their minds, but the importance of

the occasion—buying sweets by the family, as it were—is weighing upon their spirits. One youngster, indeed, who has selected chocolate, and says, when too late, 'Na, na; ah'll hae tawfie,' is reduced to tears, on learning that he must take his first selection, and displays an inclination to assault the machine.

Yes, give me an armchair in a secluded corner of the busy railway station, whence I can watch the automatic machines and their customers; and if you will throw in the morning paper and a good cigar, I will ask for nothing else to amuse my old age.

THE MONTH:

SCIENCE AND ARTS.

DR DEFONTAINE, chief physician at the well-known Creuzot Steel Works, has brought before the Paris Surgical Society a communication dealing with what is termed, for want of a better name, Electric Sunstroke. At these works the electric furnace has long been employed. This consists in reality of an enormous arc-light, between the carbon poles of which the hardest metals are instantly made as soft as butter. The intensity of the light given off by this furnace is estimated at one hundred thousand candle-power, and the workpeople, although protected by dark glasses, seem after a short acquaintance with it to suffer from all the symptoms of sunstroke. The retina of the eye is painfully affected, disturbing the sight very considerably, the discharge of tears is copious, headache and sleeplessness are engendered, and finally the skin of the face peels off. There seems to be such a great future before the electric furnace in dealing with the more refractory substances, that it is to be hoped that some means may be found of protecting those who work with it from such serious injuries.

It would seem that the operation of extracting bullets from the wounded will not in the future form a necessary part of the army surgeon's work, for, according to certain experiments which have been made in France, the new rifle projectiles are so swift in their flight that even at a range of considerably more than a mile they will pierce through the human frame, bones and all. This has been ascertained from the results of some rather ghastly experiments on the unclaimed bodies from public mortuaries and hospitals, which, with a strange want of reverence, have been used as targets.

Mr William Burgess, of the Midland Counties Fish Culture establishment, makes a handsome offer to those public bodies who are desirous of stocking depleted waters with fish. He will undertake to receive and hatch-out, free of charge, any quantity of ova which may be sent to him, returning the fry when hatched to their respective owners. Mr Burgess makes this offer for the public good, believing as he does that much benefit would accrue from stocking the various pieces of barren water that are to be found throughout the country. Such expanses of water would then fetch good rentals, for there are always anglers glad to pay for the privilege of sport. Further than this, he pleads that fresh-water fish, if obtainable in abundance, would form an important addition to our food supplies, especially in districts far

removed from railway connection. Mr Burgess will no doubt find many to accept his generous offer, for, under ordinary conditions, when the initial expense of stocking a fishery is once provided for, there is little further outlay.

We recently commented upon the sale in London of an egg of the Great Auk, which, as a curiosity, commanded an extravagant price. A party of men from the United States Fish Commission schooner recently visited Funk Island, an exposed rock thirty-two miles north-east of Nova Scotia, where this bird, now extinct owing to the greed of man, once made its home. The island was found strewn with the bones of the Auk, and more than one hundred complete sets were gathered. It will be remembered that these birds could not fly by reason of their small wings, nor could they fight. It was the custom to slaughter them with clubs before despoiling them of their coveted feathers.

A correspondent of the *Times* fears that the beautiful white moss rose, now a rare species, may be becoming extinct. For the past thirty years he has had a tree in his garden which, season after season, has borne him a supply of white roses. Last spring, this tree was treated to a plentiful supply of old manure at its roots, with the result that it has put out ten times the number of flowers; but, alas, they are all red ones! The only other cause which he thinks may have effected the change is the planting for the first time near the tree of a gaudy dahlia. He is anxious to receive some explanation of the problem.

Mr R. E. Keen, of St Leonards-on-Sea, has patented a ventilating cover which can be adapted to all kinds of receptacles in which food is either cooked or kept. The arrangement consists of a guard-plate supported on uprights, which are constructed of the material of which the vessel is made, whether it be of metal, glass, or earthenware. Milk or cream stored in such a utensil is said to keep good in hot weather for at least twelve hours longer than it would otherwise do, and the same may be said for several other perishable commodities. But it is perhaps as an adjunct to cooking-vessels that the invention is more valuable. Vegetables and fish especially keep their colour and retain their flavour, when prepared in cooking-utensils provided with ventilating covers, in a manner which at once proves the utility of the contrivance.

Of late years, and more especially since the invention of the Morse Sounder, the Telephone, and the Phonograph, much attention has been concentrated upon the phenomena of speech; and we now have means of communicating with one another at a distance which would have been thought impossible by our forefathers. But there is one method of conversing which, although probably practised for a long period, has only recently been described. The method referred to appears to be peculiar to Gomera Island, one of the Canary group, and was lately brought to the notice of the Berlin Anthropological Society by a German officer, who for some time has lived on that island, and has had every opportunity of studying the matter. He says that this island is traversed by numerous gullies and deep ravines, which are not bridged over, and across which the inhabitants are often desirous of communicating with one

another. In these circumstances they have adopted a kind of whistling language, each syllable being represented by its own appropriate tone. As the notes of the diatonic or even the chromatic scale are very limited in number, it is to be presumed that this whistling must be worked in conjunction with some kind of code; but upon this point we have no information.

Both savage and semi-barbarous peoples have always exhibited a great repugnance to any surgical operation, however necessary, which involves amputation. The *North China Herald*, in commenting upon this circumstance, points out that the Chinese have always shown this repugnance, not on account of fear or pain, for they are patient under all kinds of physical suffering, but because they look upon it as a duty to keep the body intact. If they submit to the amputation of a limb, they invariably ask for the severed member, and keep it in a box, to be buried, in due time, with the owner. Sometimes they will actually eat it, thinking it only right that that which has been taken from the body should be returned to it. On the same principle, an extracted tooth will be carefully preserved, or ground to powder and swallowed in water. Another curious phase of the same idea is seen in the belief that a sick parent can be cured by broth made from flesh cut from a living child, and it is looked upon as a sign of filial piety for the child to submit himself to an operation for that purpose. The child is supposed to be of the vital essence of the parent, and if a portion of this essence is returned to the fountain-head, the parent will be greatly strengthened. The peace-loving nature of the Chinese is said to be largely due to this respect for the human body.

We have more than once referred to experiments which have been made in the use of a bright light as an attraction for fishes. Some more trials in this direction have recently been made under the auspices of the Liverpool Marine Biology Committee with some very decided results. A subaqueous electric light was placed at one side of the ship from which these experiments were made, and a net was lowered close to it, at the same time that a similar net was submerged on the dark side of the vessel. At the end of half an hour, these nets were hauled on board, when it was found that the one which had been immersed in darkness was comparatively empty, while that which had been on the illuminated side of the vessel contained an abundance of living creatures. This experiment was repeated; and the same results were obtained again and again.

A process for giving a metallic surface to wood has lately been adopted in Germany. The wood is first of all treated in a bath of caustic alkali, after which it is submitted to a bath of hyposulphite of calcium to which sulphur has been added. Finally, it is immersed in another bath of acetate of lead. The process takes some time for its development, for the wood remains in each of these baths for several hours. After it is dry, it is capable of receiving a very high polish, and has all the appearance of a brilliant metal.

A new method of purifying alcohol has been patented by Mr T. G. Bowick, and it is said that by this means a crude spirit can be freed of its fusel oil and other deleterious ingredients. The

raw spirit to be treated is rapidly shaken up with some hydrocarbon, the exact nature of which is not stated, with the result that the fusel oil is taken up by it, leaving the spirit perfectly pure. The system has been favourably reported upon by an eminent chemist, and the patent has been purchased by a Company called the Pure Spirit Company, Limited.

We some time ago alluded to an investigation which has been going on for some months as to the effect of light upon water-colours. The first portion of the Report of the experts who were commissioned to inquire into the subject has recently been published as a blue-book. These experts find that light *per se* has very little effect on the colours now generally employed by artists; and although they denounce certain pigments as being the reverse of permanent, they have not thrown any very fresh light on the matter. Vegetable colours generally have long been known to be untrustworthy, and this fact is now corroborated. But the present inquiry has brought out the information that damp is the great enemy to the permanence of colours, and that all colours, with very few exceptions, are permanent if kept from the air. We may therefore suppose that in the future water-colour artists will devote more attention than they have hitherto done to the framing of their pictures, which should be rendered as airtight as possible. Mr J. C. Robinson, who was the prime mover in causing this useful inquiry to be made, in commenting upon this Report suggests that pictures should be framed under pressure between two sheets of glass, so that practically the air could not get to the colours. But he does not seem to be aware that glass itself yellows under the influence of light. So much is this the case, that it has been found necessary more than once to entirely reglaze a photographic studio, the darkened glass stopping the rays that are most active in causing chemical change.

Visitors to Henley and Marlow regattas this season were interested in noticing a strange-looking vessel which bore the inscription 'Electric Charging Station.' This vessel is owned by Messrs Imisch & Co., and it is said that they intend to fit up three or four more charging stations of the same kind on the Thames for the purpose of serving the electric launches which they are introducing. Each charging station will contain a compound steam-engine and a couple of dynamo-machines. The launches will contain secondary batteries, which, as our readers know, require to be charged at certain intervals. The same firm is also building a large electric pleasure-boat which will accommodate seventy persons, and which will be worked by twin propellers, each of which will be independent of the other, so that they will assist in steering the vessel in sharp bends of the river. The substitution of noiseless electric launches for the steam pleasure-boats which are growing so numerous on the Thames, is an innovation which will be welcomed alike by boatmen and by those who dwell on the banks of the river.

A deputation lately waited upon the President of the Board of Trade with reference to the great quantity of immature fish which is brought to the London market, and which is often sold by the basketful for a few pence. Sir E. Birkbeck, M.P., who introduced the deputation, said that the

matter was really an international one, and that if a select Committee of the House of Commons were to report in favour of proceedings being taken against the capture of such fish and its sale in the United Kingdom, the fishing industry would undoubtedly ask the government to take steps with a view to induce the European powers to call a conference upon the subject. The question is a most important one, and we trust that the government will see their way to deal with it effectually.

Londoners have for some years had the advantage of procuring sea-water, which is delivered at their houses by an enterprising Railway Company at a very cheap rate. So long ago as 1881, works were authorised for laying down pipes through the county of Sussex for the purpose of supplying large quantities of the same invigorating agent direct from the coast. The London Sea-water Bill has now passed both Houses of Parliament, and an extension of time has been granted for the completion of the works in question. It is intended to establish large reservoirs close to London, and probably the water will be used not only for bathing purposes, but also for watering the roads, for which it has already been proved advantageous at many towns on our coasts.

Farmers and others should take warning that the recent heavy rains have had the effect in many places of favouring the growth of certain noxious weeds which are poisonous to both horses and cattle. In two districts, animals have died with all the symptoms—as was shown by post-mortem examination—of vegetable poisoning. Inquiry led to the identification of the poisonous plant as the lesser Spearwort (*Ranunculus flammula*), a variety of crowfoot. It is not a common plant in ordinary seasons, but has lately flourished plentifully in the boggy parts of meadow-land.

It is said that in France a new employment has been found for Celluloid—which is a compound of collodion and camphor—in the sheathing of ships. Celluloid is much the same in appearance and qualities as horn, but can be made of different colours. Experiment has shown that it answers as well for ships as the usual copper sheathing, and that it keeps quite free from marine growths, even after several months' constant immersion in water. A Company has been formed to work this new application of the material, and the price fixed for plates one millimetre in thickness is at the rate of nine francs per square metre. In our own country the use of celluloid seems to have been confined to the manufacture of combs, billiard balls, and articles of a fancy description.

The wonderful 'Race to Edinburgh' by our enterprising Railway Companies has of late called a great deal of attention to railway travelling generally, and has led to some comparison of the comforts possessed by the modern traveller with the inconveniences experienced by those of fifty years ago. A correspondent of *Notes and Queries* gives some interesting particulars of the railway customs in the year 1840. The tickets were of paper, and were collected before the train started. The signal for departure was *I'd be a Butterfly* played on a bugle. The carriages were made to resemble stagecoaches as much as possible, and in the case of the Stockton and Darlington line the

first made carriage was actually the body of such a coach fixed to a railway truck. The luggage was carried on the roof, where the guards also took their places, exposed not only to the wind and rain, but also to the cinders from 'Puffing Billy.' The good old times have certainly been improved on, so far as railway travelling is concerned.

An aggrieved Amateur Photographer recently wrote to the *Times* complaining that an over-zealous Custom House officer had insisted on opening and exposing to light a number of sensitive, undeveloped negatives, which represented a large amount of work with the camera in Norway. This experience is fortunately not a common one, for the Customs officers are used to dealing with such things, owing to the numbers who carry cameras abroad, and in many ports photographic dark rooms are established for such examinations when requisite. Tourists should, if possible, develop their negatives before bringing them home, and then of course they are no longer liable to such accidents.

According to the last Trade Report of the British consul at Naples, the Neapolitan coral fisheries are in a bad way. The reefs or banks have become exhausted, and now only a very inferior quality is commonly obtained, where formerly the best coral was to be found. The boat-owners are so disheartened by their recent experience, that they talk of giving up the industry. Great numbers of the fishermen have already left the country or have found employment in agriculture or other forms of labour. From four thousand, the number of workers is reduced to one thousand; and while at one time it was customary to build fifty boats a year to replace worn-out craft, not a single new vessel was made in 1887. Calcutta is now the best market for coral, the demand in both Europe and America having much declined of late years.

Once more the cry is raised that certain of our wild-flowers and ferns are becoming extinct through the greed of those who gather them wholesale in order to send them to market. The beautiful *Osmunda regalis*, once so plentiful in Cornwall and other counties, is now rarely met with. The plant-robbers have no respect for either private or public property, and although hampers full of stolen plants have been seized and confiscated, the nefarious industry still flourishes. Round about London for miles, no primroses can be seen in the spring-time, for they have been all destroyed, the loving memory of a certain statesman being perhaps responsible for their scarcity. The remedy is in the hands of the public, who should refuse to buy such ill-gotten plants.

SUMMER WOODS.

Sing on, sweet birds !

My heart is weary of the endless strife,
The tumult and the whirl of human life.
Low on the grass, beneath the spreading shade
Of cool green boughs, my aching head is laid ;
Tired and outspent, I hear each sad sweet note
From the surrounding woodlands softly float.
Sing on, sing on !

Sing low, sweet birds !

For I am sick of all the noise and din,
The strife and tumult of this world of sin.

Loud notes would strike upon my ear in pain,
Fresh torture bringing to the throbbing brain ;
But your soft chant is soothing in its flow,
As songs my mother sang me long ago.
Sing on, sing on !

Sing tenderly !

Wounded and weak from many a conflict sore,
I love to hear those soothing strains once more,
Telling me nought of earth, but all of heaven,
Where chains that bind us here shall soon be riven.
Soft woodland voices ! grant the sweet relief
Of sympathetic tones to calm my grief.
Sing on, sing on !

Sing me to sleep !

Each sound of human life is far away ;
Under green branches western sunbeams play,
And through the stillness of the woods I hear
Only the plashing waters of the mere,
Sighing among the sedges at my feet,
And in the tall tree tops those wood-notes sweet.
Sing on, sing on !

Sing in my dreams !

Still let me feel that gentle melody
Steal through my sleeping spirit peacefully,
Blending its sweetness with the visions bright,
Heaven-sent to soothe me with their strange delight ;
Though half unconscious wrapt in dreamy peace,
I should awake were that low song to cease.
Sing on, sing on !

Sing when I wake !

Fill the dim woods with melody divine,
Fill with its echoes this sad heart of mine,
Unstrung and tuneless as a broken lute,
So long to every chord of music mute ;
Oh bid it answer to the sweet appeal
Of haunting strains which round its pulses steal !
Sing on, sing on !

Sing on, sweet birds !

Unknown to me the language that ye sing,
Unknown the tender harmonies that ring
In blended concert through the forest dim,
Where breeze and bough and streamlet join the
hymn ;
I only know that on my heart the while
Peace falleth, e'en as from an angel's smile.
Sing on, sing on !

MEN AND PLACES.

Nor the least interesting of the many phases of the law of the association of ideas is the curious result produced in the human mind by the connection of ideas which are, as Locke says, 'in themselves not at all of kin,' but which are united wholly owing to chance or custom. Such ideas, he adds, 'come to be so united in some men's minds that it is very hard to separate them; they always keep in company, and the one no sooner at any time comes into the understanding, than its associate appears with it; and if they are more than two which are thus united, the whole gang, always inseparable, show themselves together.' To enter fully into even this one branch of association would be too great a task, since it is evident that there are many ideas which are suggested to all men alike by other ideas that are 'not at all of kin,' and that, moreover, everybody has certain private ideas which inevitably suggest others. In reference to places, Charles Lamb, for example, once raised an indignant howl by asserting that the little pie-shop in a certain murky London thoroughfare was dearer to him than a mountain. And so it is with all of us: every man has some place which is dear to him owing to happy associations. But the connection that exists in the minds of the great reading public between men and places is only one phase of this branch.

It has frequently been observed that it is just as impossible to think of Sinai without the Law-giver as it would be to think of Jerusalem without including the Man of Sorrows. This is perfectly true; and of the association of great lives with particular places there are many more examples. Imagine Greece without Homer; Rome without Horace; Genoa without Columbus; Venice without Titian; Antwerp without Rubens; Florence without Dante; Weimar without Goethe and Schiller—all are equally impossible. In our own country there are scores of names which are inseparably linked to places. To specialists and students there are many more; but examples

known to all will amply suffice to show the connection.

Take first the rivers, which every true poet loves, and of which many of our greatest bards have sung. Think of the Avon without Shakespeare! The Doon, even without the adjective 'bonnie,' cannot be thought of without recalling memories of Burns; and the Tweed, the gentle ripple of which could be heard by those present at the death of the great novelist, will ever be associated with the genius of Scott. Then imagine the Ouse without Bunyan and Cowper; the Dove without dear old Izaak and his companion Charles Cotton; the Trent without Byron and Kirke White; the Thames without the bard of Twickenham!

As to places, who can think of the Lake Country without Wordsworth, Wilson, Coleridge, De Quincey—and, *inter alia*, of some nebulous passages in the *Confessions of an Opium Eater*—Southey, Harriet Martineau, and others? Or can anybody imagine Sheffield without Chantrey, Montgomery, or Ebenezer Elliott, whose rugged rhymes did so much towards the repeal of the corn laws? To a section of the reading public, Darwin is always associated with the Kentish village of Down, just as another section cannot think of Bournemouth without Keble. Nor can one think of Newcastle without Stephenson; Gadshill without Dickens; Kensington without Thackeray; Dean Prior, 'in dull Devonshire,' without Herrick; or Eversley without Charles Kingsley.

Edinburgh and London, the two great literary centres, are more especially peculiar in this respect, since many names are suggested at mention of the former, and some districts of the metropolis recall hosts of memories. Modern Athens is principally associated with the names of the famous contributors to the *Edinburgh Review* and *Blackwood's Magazine*. As to London, Chelsea is perhaps the most prolific district in suggestions of this kind. Carlyle, of course, comes first with everybody. Addison, Steele, Sir Thomas More, the Earl of Orrery, Locke, Boyle, Dean Swift, Arbuthnot, J. M. W. Turner, D. G. Rossetti, Sir Christopher Wren,

Leigh Hunt, Horace Walpole—these are a few of the names that will occur to most people at the mention of Chelsea. The district of which Fleet Street may be called the centre has also many great names connected with it. Fleet Street itself at once suggests Johnson, Goldsmith, and Fielding; the India House cannot be thought of without the gentle Elia; and the General Post-office conjures up memories of Trollope and other modern literary men.

These examples suffice to show how closely united in the mind men and places are. Even in the case of living authors or politicians, everybody must have noticed how inseparably connected the association is; and in addition to those names and places which are familiar to everybody, there are others which appeal to a limited circle only.

It is not without significance to note that, although a certain amount of interest is attached to the birthplace of a great man, posterity generally associates him with the place where the work for which he is famous was accomplished. Few people, for example, think of the birthplace of Macaulay, of Richardson, of Nelson, of Wellington, or of Havelock. There are exceptions, it is true; but the exceptions in the case of really great men might be counted on the fingers of both hands, even when they have spent the greater portion of their lives in their birthplace. It is strange, too, that if a place produces one eminent man, it generally produces others; and that if a list be made of the birthplaces of the sixty most eminent men—confining the list to those who were dead by 1860—it will be found that about one-third of that number were born in London, although, it need scarcely be said, the metropolis never had one-third of our population. Among the poets, the capital produced Milton, Spenser, Chaucer, Ben Jonson, W. Blake, Pope, and Keats. Besides these, Defoe, Canning, Sir Thomas More, Bacon, Becket, Turner, Landseer, Gibbon, and Bentham were also Londoners. Both the north and the extreme south of England are badly represented on the list; while the district around Stratford-on-Avon, the county of Devonshire, and in the neighbourhood of Wiltshire, have been disproportionately successful. Shakespeare, Dryden, Samuel Johnson, Macaulay, Latimer, Richardson, and Bishop Butler were all born within a comparatively small district, of which Stratford is the centre. Bristol, and the counties adjacent to it, produced Locke, Fielding, Hobbes, Chatterton, Addison, Clarendon, and others; whilst in Devonshire were born Marlborough, Coleridge, Raleigh, Hooker, and Reynolds. Taking the list of sixty men, and going through the whole, it will be found that about one-tenth of the country has produced more than half its greatest men. It is therefore not surprising that certain districts should be so full of interesting associations, whilst others are absolutely barren, seeing that the birthplaces of men of genius are not scattered over the whole of England, but massed together. Among contemporary poets, London still maintains a good average, for it produced both Browning and Swinburne. In regard to novelists, it is strange that Portsmouth in this century has produced two—Charles Dickens and Walter Besant.

Another interesting phase of the association of men with places is shown when one hears or reads

of any of those famous battles in which British arms have proved victorious. Think of Agincourt, Cressy, 'immortal Waterloo,' and many other places, and what a flood of names rush through the memory! Longfellow says: 'Even scenes unlovely in themselves become clothed in beauty when illuminated by the imagination, as faces in themselves become so by the expression of thought and feeling;' and this special interest that attaches to places by the association of great lives or great deeds serves not only to transform those places; it also helps to keep in the memory much which should never be forgotten.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER L.—THE CAP MARTIN CATASTROPHE.

As Warren Relf paused there on the step of the carriage one second, before he jumped, he was dimly aware of a curious fact that caught his attention, sideways, even at that special moment of doubt and danger: many other doors on the landward side of the train stood also open, and other passengers beside himself, with fear and surprise depicted visibly on their pale faces, were stepping out, irresolute, just as he himself had done, upon the narrow footboard. Could they have heard the struggle? he wondered vaguely to himself. Could they have gained some hasty inkling of the tragic event that had taken place, so secretly, all unknown as he supposed, in his own compartment? Had some neighbouring traveller caught faintly the muffled sounds of a desperate fight? Had he suspected an attack upon some innocent passenger? Had he signalled the guard to stop the train? for it was slowing still, slowing yet more sensibly and certainly each moment. More and more pale faces now appeared at the doors; and a Frenchman standing on the footboard of the next compartment, a burly person of military appearance, with an authoritative air, cried aloud in a voice of quick command, 'Sautiez, donc! Sautiez!' At the word, Warren leaped, he knew not why, from the doomed carriage. The Frenchman leaped at the self-same moment. All down the train, a dozen or two of passengers followed suit as if by a concerted order. Warren had no idea in his own mind what was really happening, but he knew the train had slackened speed immensely, and that he had landed on his feet and hands on the rubbly bank with no more result, so far as he himself could see just then, than a sprained ankle and some few bleeding wounds on his knees and elbows.

Next instant a horrible crash resounded through the air, and bellowed and echoed with loud reverberation from the rocky walls of those sheer precipices. Thud, thud, thud followed close on the crash, as carriage after carriage shocked fiercely against the engine and the compartments in front of it. Then a terrible sight met his eyes. The train had just reached the ledge of cliff beyond, and with a wild rocking disappeared all at once over the steep side into the sea below. Nothing in life is more awful in its unexpectedness than a great railway accident. Before Warren had even time to know what was taking place by his

side, it was all over. The train had fallen in one huge mass over the edge of the cliff, and Hugh Massinger, with his eleven thousand pounds safe in his pocket, was hurried away without warning or reprieve into ten fathoms deep of blue Mediterranean.

Everybody remembers the main features of that terrific accident, famous in the history of French railway disasters as the Cap Martin catastrophe. Shortly after passing Roquebrune station (where the through-trains do not stop), one of the engine-wheels became loosened by a violent shock against a badly-laid sleeper, and, thus acting as a natural brake, brought the train almost to a stand-still for a few seconds, just opposite the very dangerous ledge known locally as the Borrigio escarpment. The engine there left the rails with a jerk, and many of the passengers, seeing something serious was likely to take place, seized the opportunity, just before the crash, of opening the doors on the landward side, and leaping from the train while it had reached its slowest rate of motion, on the very eve of its final disaster. One instant later, the engine oscillated violently and stopped altogether; the other carriages telescoped against it; and the entire train, thrown off its balance with a terrible wrench, toppled over the sheer precipice at the side into the deep water that skirts the foot of the neighbouring mountains. That was the whole familiar story as the public at large came, bit by bit, to learn it afterwards. But for the moment, the stunned and horrified passengers on the bank of the torrent only knew that a frightful accident had taken place with incredible rapidity, and that the train itself, with many of their fellow-travellers seated within, had sunk like lead in the twinkling of an eye to the bottom of the bay, leaving the few survivors there on dry land aghast at the inexpressible suddenness and awfulness of this appalling calamity.

As for Warren Relf, amid the horror of his absorbing life-and-death struggle with Hugh Massinger, and the abiding awe of its terrible consummation, he had never even noticed the angry jerking of the loosened wheel, the whir that jarred through the shaken carriages, the growing oscillation from side to side, the evident imminence of some alarming accident. Sudden as the catastrophe was to all, to him it was more sudden and unexpected than to any one. Till the actual crash itself came, indeed, he did not realise why the other passengers were hanging on so strangely to the narrow footboard. The whole episode happened in so short a space of time—thirty seconds at best—that he had no opportunity to collect and recover his scattered senses. He merely recognised at first in some stunned and shattered fashion that he was well out of the fatal train, and that a dozen sufferers lay stretched in evident pain and danger on the low bank of earth beside him.

For all the passengers had not fared so well in their escape as he himself had done. Many of them had suffered serious hurt in their mad jump from the open doorway, alighting on jagged points of broken stone, or rolling down the sides of the steep ravine into the dry bed of the winter torrent. The least injured turned with one accord to help and tend their wounded companions. But as for the train itself, it had simply disappeared. It was as though it had never been. Scarcely a sign

of it showed on the unruffled water. Falling sheer from the edge of that precipitous crag into the deep bay, it had sunk like a stone at once to the very bottom. Only a few fragments of broken wreckage appeared here and there floating loose upon the surface. Hardly a token remained beside to show the outer world where that whole long line of laden carriages had toppled over bodily into the profound green depths that still smiled so sweetly between Roquebrune and Mentone.

For a while, distracted by this fresh horror, Warren could only think of the dead and wounded. His own torn and blood-stained condition excited no more attention or curiosity now on the part of bystanders than that of many others among his less fortunate fellow-passengers. Nor did he even reflect with any serious realisation that Elsie was saved and his own character practically vindicated. The new shock had deadened the sense and vividness of the old one. In the face of so awful and general a calamity as this, his own private fears and doubts and anxieties seemed to shrink for the moment into absolute insignificance.

In time, however, it began slowly to dawn upon his bewildered mind that other trains might come up from Monaco or Mentone and dash madly among the broken debris of the shattered carriages. Whatever caused their own accident might cause accidents also to approaching engines. Moreover, the wounded lay scattered about on all sides upon the track, some of them in a condition in which it might indeed be difficult or even dangerous to remove them. Somebody must certainly go forward to Mentone to warn the *chef de gare* and to fetch up assistance. After a hurried consultation with his nearest neighbours, Warren took upon himself the task of messenger. He started off at once on this needful errand, and plunged with a heart now strangely aroused into the deep darkness of the last remaining tunnel.

His sprained ankle caused him terrible pain at every step; but the pain itself, joined with the consciousness of performing an imperative duty, kept his mind from dwelling too much for the moment on his own altered yet perilous situation. As he dragged one foot wearily after the other through that long tunnel, his thoughts concentrated themselves for the time being on but one object—to reach Mentone and prevent any further serious accident.

When he had arrived at the station, however, and despatched help along the line to the other sufferers from the terrible disaster, he had time to reflect in peace for a while upon the sudden change this great public calamity had wrought in his own private position. The danger of misapprehension had been removed by the accident as if by magic. Unless he himself chose to reveal the facts, no soul on earth need ever know a word of that desperate struggle with mad Hugh Massinger in the wrecked railway carriage. Even supposing the bodies were ultimately dredged up or recovered by divers, no suspicion could now possibly attach to his own conduct. The wound on Hugh's head would doubtless be attributed to the fall alone; though the chance of the body being recognisable at all after so horrible a catastrophe would indeed be slight, considering the way the carriages had

doubled up like so much trestle-work upon one another before finally falling. Elsie was saved; that much at least was now secured. She need know nothing. Unless he himself were ever tempted to tell her the ghastly truth, that terrible episode of the death-struggle in the doomed train might remain for ever a sealed book to the woman for whose sake it had all been enacted.

Warren's mind, therefore, was made up at once. All things considered, it had become a sacred duty for him now to hold his tongue for ever and ever about the entire incident. No man is bound to criminate himself; above all, no man is bound to expose himself when innocent to an unjust yet overwhelming suspicion of murder. But that was not all. Elsie's happiness depended entirely upon his rigorous silence. To tell the whole truth, even to her, would be to expose her shrinking and delicate nature to a painful shock, as profound as it was unnecessary, and as lasting as it was cruel. The more he thought upon it, the more plain and clear did his duty shine forth before him. Chance had supplied him with a strange means of honourable escape from what had seemed at first sight an insoluble dilemma. It would be folly and worse, under his present conditions, for him to refuse to profit by its unconscious suggestion.

Yet more: he must decide at once without delay upon his line of action. News of the catastrophe would be telegraphed, of course, immediately to England. Elsie would most likely learn the whole awful episode that very evening at her hotel in London: he could hear the very cries of the street boys ringing in his ears: 'Speshul Edition. Appalling Railway Accident on the Riviayrer! Great Loss of Life! A Train Precipitated into the Mediterranean!' If not, she would at anyrate read the alarming news in an agony of terror in the morning papers. She knew Warren himself was returning to San Remo by that very train. She did not know that Hugh was likely to be one of his fellow-passengers. She must not hear of the accident for the first time from the columns of the *Times* or the *Pall Mall Gazette*. He must telegraph over at once and relieve beforehand her natural anxiety for her future husband's safety. But Hugh's name and fate need not be mentioned, at least for the present; he could reserve that revelation for a more convenient season. To publish it, indeed, would be in part to incriminate himself, or at least to arouse unjust suspicion.

He drove to the telegraph office, worn out as he was with pain and excitement, and despatched a hasty message that moment to Elsie: 'There has been a terrible accident to the train near Mentone, but I am not hurt, at least to speak of—only a few slight sprains and bruises. Particulars in papers. Affectionately, WARREN.' And then he drove back to the scene of the catastrophe.

It was a week before all the bodies were dredged up by relays of divers from the wreck of that ill-fated and submerged train. Hugh Massinger's was one of the last to be recovered. It was found, minus a large part of the clothing, which the sea had torn off. The eleven thousand pounds in French bank-notes never turned

up at all again. His money indeed had perished with him.

They buried all that remained of that volcanic life on the sweet and laughing hillside at Mentone. A plain marble cross marks the spot where he rests. On the plinth stand graven those prophetic lines from the plaintive poem to *A Life's Philosophy*:

Here, by the haven with the hoary trees,
O lurid poet's heart, lie still:
No longer strive amid tempestuous seas
To curb wild waters to thy wayward will.
Above thy grave
Wan olives wave,
And oleanders court deep-laden bees.

That nought of fulfilment might be wanting to his prayer, Warren Relf with his own hand planted a blushing oleander above the mound where that fiery poet's heart lay still for ever. He had nothing but pity in his soul for Hugh's wasted powers. A splendid life, marred in the making by its own headstrong folly. And Winifred, who loved him, and whose heart he broke, lay silent in the self-same grave beside him.

CHAPTER LI.—NEXT OF KIN WANTED.

The recovery of Hugh's body from the shattered train gave Warren Relf one needful grain of internal comfort. He identified that pale and wounded corpse with reverent care, and waited in solemn suspense and unspoken anxiety for the result of the customary *post-mortem* examination. The doctors' report reassured his soul. Death had resulted, so the medical evidence conclusively proved, not from the violent injuries observed on the skull, and apparently produced, they said, by a blow against the carriage door, but from asphyxiation, due to drowning. Hugh was still alive, then, when the train went over! His heart still beat and his breath still came and went feebly till the actual moment of the final catastrophe. It was the accident, not Warren's hand, that killed him. Innocent as Warren knew himself to be, he was glad to learn from this authoritative source that even unintentionally he had not made himself Hugh Massinger's accidental executioner.

But in any case they must break the news gently to Elsie. Warren's presence was needed in the south for the time being, to see after Winifred's funeral and other necessary domestic arrangements. So Edie went over to England on the very first day after the fact of Hugh's disappearance in the missing train had become generally known to the little world of San Remo, to soften the shock for her with sisterly tenderness. By a piece of rare good fortune, Hugh Massinger's name was not mentioned at all in the earlier telegrams, even after it was fairly well known at Mentone and Monte Carlo that the lucky winner, whose success was in everybody's mouth just then, had perished in one of the lost carriages. The despatches only spoke in vague terms of 'an English gentleman lately arrived on the Riviera, who had all but succeeded in breaking the bank that day at Monte Carlo, and was returning to San Remo, elated by success, with eleven thousand pounds of winnings in his pocket.' It was not in the least likely that Elsie would dream of recognising her newly bereaved cousin under this

highly improbable and generalised description—especially when Winifred, as she well knew, was lying dead meanwhile, the victim of his cold and selfish cruelty, at the *pension* at San Remo. Edie would be the first to bring her the strange and terrible news of Hugh's sudden death. Warren himself stopped behind at Mentone, as in duty bound, to identify the body formally at the legal inquiry.

He had another reason, too, for wishing to break the news to Elsie through Edie's mouth rather than personally. For Edie knew nothing, of course, of the deadly struggle in the doomed train, of that hand-to-hand battle for life and honour; and she could therefore with truth unfold the whole story exactly as Warren wished Elsie first to learn it. For her, there was nothing more to tell than that Hugh, with incredible levity and brutal want of feeling, had gone over to Monte Carlo to gamble openly at the public tables, on the very days while his poor young wife, killed inch by inch by his settled neglect, lay dead in her lonely lodging at San Remo: that he had returned a couple of evenings later with his ill-gotten gains upon the fated train: and that, falling over into the sea with the carriages from which Warren just barely escaped with dear life, he was drowned in his place in one of the shattered and sunken compartments. That was all: and that was bad enough in all conscience. What need to burden Elsie's gentle soul any further with the more hideous concomitants of that unspeakable tragedy?

Elsie bore the news with far greater fortitude than Edie in her most sanguine mood could have expected. Winifred's death had sunk so deep into the fibres of her soul that Hugh's seemed to affect her far less by comparison. She had learnt to know him now in all his baseness. It was the recognition of the man's own inmost nature that had cost her dearest. 'Let us never speak of him again, dear Warren,' she wrote to her betrothed, a few days later. 'Let him be to us as though he had never existed. Let his name be not so much as mentioned between us. It pains and grieves me ten thousand times more, Warren, to think that for such a man's sake as he was, I should so long have refused to accept the love of such a man as I now know you to be.'

Those are the hardest words a woman can utter. To unsay their love is to women unendurable. But Elsie no longer shrank from unsaying it. Shame and remorse for her shattered ideal possessed her soul. She knew she had done the true man wrong by so long rejecting him for the sake of the false one.

At sand-girt Whitestrand, meanwhile, all was turmoil and confusion. The news of the young Squire's tragic death, following so close at the heel of his frail little wife's, spread horror and surprise through the whole community. The vicar's wife was all agog with excitement. The reticule trembled on her palpitating wrist as she went the round of her neighbours with the surprising intelligence. Nobody knew what might happen next, now the last of the Meyseys was dead and gone, while the sandbanks were spreading half a mile to seaward, and the very river was turned from its course by encroaching hummocks into a new-cut channel. The mortgagees, to be

sure, were safe with their money. Not only was the property now worth on a rough computation almost as much as it had ever been, but Winifred's life had been heavily insured, and the late Mr Massinger's estate, the family attorney remarked with a cheerful smile, was far more than solvent—in fact, it would prove a capital inheritance for some person or persons unknown, the heirs-at-law and next-of-kin of the last possessor. But good business lay in store, no doubt, for the profession still. Deceased had probably died intestate. Endless questions would thus be opened out in delicious vistas before the entranced legal vision. The marriage being subsequent to the late Married Woman's Property Act, Mrs Massinger's will, if any, must be found and proved. The next of kin and heir-at-law must be hunted up. Protracted litigation would probably ensue; rewards would be offered for certificates of birth; records of impossible marriages would be freely advertised for, with tempting suggestions of pecuniary recompense to the lucky discoverer. Research would be stimulated in parish clerks; affidavits would be sworn to with charming recklessness; rival claimants would commit unblushing alternative perjuries on their own account, with frank disregard of common probability. It would rain fees. The estate would dissolve itself bodily by slow degrees in a quagmire of expenses. And all for the benefit of the good attorneys! The family lawyer, in the character of Danaö—for this occasion only, and without prejudice—would hold out his hands to catch the golden shower. A learned profession would no doubt profit in the end to a distinct amount by the late Mr Massinger's touching disregard of testamentary provision for his unknown relations.

Alas for the prospects of the learned gentlemen! The question of inheritance proved itself in the end far easier and less complex than the family attorney in his professional zeal had at first anticipated. Everything unravelled itself with disgusting simplicity. The estate might almost as well have been unencumbered. The late Mrs Massinger had left no will, and the property had therefore devolved direct by common law upon her surviving husband. This was awkward. If only now, any grain of doubt had existed in any way as to the fact that the late Mrs Massinger had predeceased her unfortunate husband, legal acumen might doubtless have suggested innumerable grounds of action for impossible claimants on either side of the two families. But unhappily for the exercise of legal acumen, the case as it stood was all most horribly plain sailing. Hugh Massinger, Esquire, having inherited in due course from his deceased wife, the estate must go in the first place to Hugh Massinger himself, in person. And Hugh Massinger himself having died intestate, it must go in the next place to Hugh Massinger's nearest representative. True, there still remained the agreeable and exciting research for the missing heir-at-law; but the pursuit of hunting up the heir-at-law to a given known indisputable possessor is as nothing in the eyes of a keen sportsman compared with the Homeric joy of battle involved in the act of setting the representatives of two rival and uncertain claims to fight it out, tooth and nail together, on the free and open arena of the Court of Probate. It was with a sigh of regret, therefore, that the family attorney, good

easy man, drew up the advertisement which closed for ever his vain hopes of a disputed succession between the moribund houses of Massinger and Meysey, and confined his possibilities of lucrative litigation to exploiting the house of Massinger alone, for his own use, enjoyment, and fruition.

It was some two or three weeks after Hugh Massinger's tragic death that Edie Relf chanced to observe in the Agony Column of that morning's *Times* a notice couched in the following precise and poetical language :

'HUGH MASSINGER, Esquire, deceased, late of Whitestrand Hall, in the county of Suffolk.—Any person or persons claiming to represent the heir or heirs-at-law and next of kin of the above-named gentleman (who died at Mentone, in the Department of the Alpes Maritimes, in the French Republic, on or about the 17th day of November last past) are hereby requested to apply immediately to ALFRED HEBERDEN, Esq., Whitestrand, Suffolk, solicitor to the said Hugh Massinger.'

Edie mentioned the matter at once to Warren, who had come over from France as soon as he had completed the necessary arrangements at San Remo and Mentone; but Warren heard it all with extreme disinclination. He couldn't bear even to allude to the fact in speaking to Elsie. Directly or indirectly, he could never inherit the estate of the man whose life he had been so nearly instrumental in shortening. And if Elsie was soon, as he hoped, to become his wife, he would necessarily participate in whatever benefit Elsie might derive from inheriting the relics of Hugh Massinger's ill-won Whitestrand property.

'No, no,' he said. 'The estate was simply the price of blood. He married that poor little woman for nothing else but for the sake of Whitestrand. He killed her by slow degrees through his neglect and cruelty. If he hadn't married her, he would never have been master of that wretched place: if he hadn't married her, he would have had nothing of his own to leave to Elsie. I can't touch it, and I won't touch it. So that's flat, Edie. It's the price of blood. Let it, too, perish with him.'

'But oughtn't you at least to mention it to Elsie?' Edie asked with her plain straightforward English common-sense. 'It's her business more than it's yours, you know, Warren. Oughtn't you at least to give her the option of accepting or refusing her own property?—It's very kind of you, of course, to decide for her beforehand so cavalierly.—Perhaps, you see, when she learns she's an heiress, she may be inclined to transfer her affections elsewhere.'

Warren smiled. That was a point of view that had never occurred to him. Your male lover makes so sure of his prey: he hardly allows in his own mind the possibility of rejection. But still he prevaricated. 'I wouldn't tell her about it, just yet at least,' he answered hesitatingly. 'We don't know, after all, that Elsie's really the heir-at-law at all, if it comes to that. Let's wait and see. Perhaps some other claimant may turn up for the property.'

'Perhaps,' Edie replied, with her oracular brevity. 'And perhaps not. There's nothing on earth more elastic in its own way than a good perhaps. India-rubber bands are just mere child's

play to it.—Suppose, then, we pin it down to a precise limit of time, so as to know exactly where we stand, and say that if the estate isn't otherwise claimed within six weeks, we'll break it to Elsie, and allow her to decide for herself in the matter?'

'But how shall we know whether it's claimed or not?' Warren asked dubiously.

'My dear, there exists in this realm of England a useful institution known to science as a penny post, by means of which a letter may be safely and inexpensively conveyed even to so remote and undistinguished a personage as Alfred Heberden, Esquire, solicitor to the deceased, Whitestrand, Suffolk.—I propose, in fact, to write and ask him.'

Warren groaned. It was an awkward fix. He wished he could shirk the whole horrid business. To be saddled against your will with a landed estate that you don't want is a predicament that seldom disturbs a modest gentleman's peace of mind anywhere. But he saw no possible way out of the odd dilemma. Edie was right, after all, no doubt. As yet, at least, he had no authority to answer in any way for Elsie's wishes. If she wanted Whitestrand, it was hers to take or reject as she wished, and hers only. Still, he salved his conscience with the consolatory idea that it was not actually compulsory upon him to show Elsie any legal advertisement, inquiry, or suggestion which might happen to emanate from the solicitors to the estate of the late Hugh Massinger. So far as he had any official cognisance of the facts, indeed, the heirs, executors, and assigns of the deceased had nothing on earth to do in any way with Elsie Challoner, of San Remo, Italy. Second cousinhood is at best a very vague and uncertain form of relationship. He decided, therefore, not without some internal qualms, to accept Edie's suggested compromise for the present, and to wait patiently for the matter in hand to settle itself by spontaneous arrangement.

But Alfred Heberden, Esquire, solicitor to the deceased, acted otherwise. He had failed to draw any satisfactory communications in answer to his advertisement save one from a bogus firm of so-called Property Agents, and one from a third-rate pawnbroker in the Borough Road whose wife's aunt had once married a broken-down railway porter of the name of Messenger, from Weem in Shropshire, and who considered himself, accordingly, the obvious representative and heir-at-law of the late Hugh Massinger of the Utter Bar, and of Whitestrand Hall, in Suffolk, Esquire, deceased without issue. Neither of these applications, however, proving of sufficient importance to engage the attention of Mr Alfred Heberden's legal mind, that astute gentleman proceeded entirely on his own account to investigate the genealogy and other antecedents of Hugh Massinger, with a single eye to the discovery of the missing inheritor of the estate, envisaged as a person from whom natural gratitude would probably wring a substantial solatium to the good attorney who had proved his title. And the result of his inquiries into the Massinger pedigree took tangible shape at last, a week or two later, in a second advertisement of a more exact sort, which Edie Relf, that diligent and careful student of the second column,

the most interesting portion of the whole newspaper to Eve's like-minded daughters, discovered and pondered over one foggy morning in the blissful repose of 128 Blethingley Road, South Kensington.

'CHALLONER: Heir-at-law and Next of Kin Wanted. Estate of HUGH MASSINGER, Esquire, deceased, intestate.—If this should meet the eye of ELSIE, daughter of the late Rev. H. Challoner, and Eleanor Jane his wife, formerly Eleanor Jane Massinger, of Chudleigh, Devonshire, she is requested to put herself into communication with ALFRED HEBERDEN, Esq., Whitestrand, Suffolk, when she may hear of something greatly to her advantage.'

Edie took the paper up at once to Warren. 'For "may" read "will,"' she said pointedly. 'Lawyers don't advertise unless they know. I always understood Mr Massinger had no living relations except Elsie. This question has reached boiling-point now. You'll have to speak to her after that about the matter.'

PEOPLE'S BANKS.

SINCE the two articles on this subject appeared in these columns on the 22d of September and the 24th of November 1883, a movement was begun which has resulted in the establishment of a People's Bank in Edinburgh. At a meeting held on the 17th of March 1888 of the 'East of Scotland Co-operative Conference Association'—a body composed of about a dozen district Co-operative Associations—a set of rules was framed, and instructions were issued to a Committee to prepare and despatch a prospectus stating the objects of the bank to any persons likely to become shareholders. Previous meetings had been held on the subject, and it was unanimously and finally resolved to proceed with the formation of the bank.

The groundwork of the rules is laid on the model of the Italian rather than the German People's Banks, for the former have limited, and the latter unlimited liability. The new People's Bank is strictly co-operative in character, and can, as restricted by the Act, lend only to its own members, each of whom must hold one share of one pound nominal value per share. Thus, if one wanted to borrow, a deposit of 5s. would fall to be made, as representing the 2s. 6d. call for allotment and 2s. 6d. call on application for one share. The Italian People's Banks are more elastic than this; for, after satisfying the wants of their own members, they reserve the power to lend what is over of their available means to non-members.

In the rules of the new People's Bank, the Board of Directors may sell, exchange, or mortgage, build or rebuild upon any land; and its object is stated as 'to carry on the business of banking, the buying and selling of all kinds of produce and manufactures, and the buying and selling of land.' With regard to the last-named, two powers which are only intended to be held *in potentia*, it may be stated that the Scotch banks find their troubles begin when they stray from the path of banking proper. Readers of Sir William Forbes's *Memoirs of a Banking House* will remember that he dates the prosperity of his bank

from the time when he determined resolutely to devote his whole energies to banking alone.

The new Banking Society is prepared to borrow from any one on loan, which loan 'shall be a first charge upon the general assets of the Society.' Deposits will be taken at rates to be agreed upon; but the loans and deposits thus obtained must not exceed the general assets of the Company for the time being.

Registration of the Society as the 'People's Bank, Limited,' is made under the Industrial and Provident Societies' Act, 1876; and certain advantages arise therefrom. By thus registering, a corporate body is formed; no list of shareholders need be given; and the funds of the corporation, and not of the corporators, are held for the debts when the shares have been paid up. The bank can re-register at any time as a Limited Liability Company, and the personal interest of each member in the Society cannot exceed two hundred pounds. It is exempt from income tax and certain stamp duties; and special facilities are afforded for dealing with the funds of intestate members. The officers are bound to furnish security; and by an appeal to the Registrar, the bank's Board can speedily be taken to task in the event of anything proving amiss with the affairs of the bank. The Act containing these paternal provisions is intended to foster and protect such institutions; and it may be stated that its promoters prefer this mode of registration to that under the Limited Liability Acts, as more power is conferred on the directors under the latter system than under the Provident Acts, which secure and safeguard members' rights more effectually, and fetter more rigidly the powers of the Board of management. It is stipulated in the rules that no office-bearer can get a loan from the Society. This would have been a good rule for the directors of some banks that have failed. A strong point of difference between this bank and the Italian People's Banks is that, according to the Act under which it is registered, it cannot lend money against or on the security of its own shares, whereas the Italian banks do so. This legislation is intended to keep the capital intact in the interests of the depositor.

It may be worth while glancing for a little at the causes which have contributed to impede the movement for the establishment of People's Banks in this country. The great cause has been, without doubt, the ready means for investing money in small sums offered by the Post Office and other Savings Banks, along with the reasonable rate of interest allowed on all such placements. In this country, too, there is a vast amount of large capitalists against whom it would not be easy for working-men to contend; prejudices against ideas of continental origin are strong; and the English mind is not prone to change. Moreover, it is only within recent years that co-operation has reached any degree of development at all commensurate with the extent of the area on which it can act. There has been co-operation in everything affecting the employed in their relation to their employers, in cheapening the cost of the necessities of life, and to some extent in production; but none for the extension of credit to or the diffusion of money among the members of the industrial classes in connection with the operations of trade generally.

Now that a moneyed co-operation has been begun, it will be interesting to watch its further progress and ultimate development. There is room for such a movement, which need not interfere in the slightest with the work and usefulness of the larger banks.

As the new People's Bank proposes to imitate the Italian Co-operative People's Banks, we shall give a detailed account of these institutions, which have accomplished splendid results within a short period, and have helped to build up the best kind of Italian unity—namely, material comfort and prosperity.

There is much that is favourable to the growth of small banks in Italy—that land of the olive and the vine—notably the existence of so vast a mass of peasant proprietors, many of whom, till taken by the hand by these People's Banks, were wretchedly poor, being bled almost to death by usurers. In fact, there was a vast field for credit co-operation to work on, and what was better, a brotherly feeling to work with.

The last Foreign Office Report of 1887 contains valuable statistics, of which we shall present a summary narrating the condition of these banks down to 1885.

In the year 1865, the first People's Bank was founded; and on the 31st of December 1885—twenty years later—there were no fewer than 423 Co-operative Associations of credit and People's Banks in Italy, the rate of increase being such that 107 new banks were established in 1885 alone, chiefly in the south. The capital represented by these 423 Italian banks is £2,764,244 nominal capital—that is, capital which they have the power to create—£2,678,084 of subscribed capital, and £2,498,688 paid-up capital. From this statement, the capital would appear to be pretty well paid up. This capital has attracted deposits of savings to the extent of £6,684,344; and other deposits on accounts current for £5,026,880; while interest-bearing bonds for a definite term, and necessarily commanding a higher rate of interest, stand at £1,367,124.

Under the head of Advances by these banks, the principal item appears to be that for short bills—namely, three months' bills and under, which stands at £5,363,400; the bills over this currency being £3,004,924; and renewals, or, as they term them, 'prolongations,' £778,077. This yields the large sum of £9,146,400 as advanced in all on bills, which demonstrates that a bill as a commercial instrument enjoys as much repute in Italy as in this country.

The sum of £99,907 represents advances on pledge of goods, and shows an average of about £240 loan per bank. This is not considered a desirable form of security, but it could hardly fail to form part of what would be tendered in this way by the industrial class. On State Debt Securities a sum of £2,361,036 appears to have been lent; and on Accounts Current, £2,544,884. The other advances would seem to be on obligations of corporate bodies, Companies' debentures, mortgages, and private corporations. Small unsecured loans were given to private persons to the extent of £3910. It is a very creditable feature the apportioning thus of a small sum annually out of the profits towards what are called 'loans of honour' to the very poor. In the same balance-sheet of December 31, 1885, a sum appears on

both sides of £1,893,816, being value of deposits free and for safe keeping. It appears commendable to include this item in the banks' balance-sheet and books. These deposits must be securities in the banks' custody, and the object of entering them as obligations is to ensure that they shall not escape notice as obligations of the banks. This system might be recommended to other banks, as offering a check on the articles of value under their care.

As regards the membership of these banks, 195 establishments were represented by 139,949 persons, being an average of 717 shareholders to each bank. A classification of these members according to occupation gives an average of 24·28 to small farmers; 26·40 to small manufacturers and merchants; 8·57 to workmen; clerks, &c., 14·54. This shows the classes mainly benefited by these People's Banks to be the small agriculturist, merchant, and manufacturer. Of course, a working-man who starts in business for himself would no longer be reckoned as such. The value of these banks is proved by their elevating him into a fitting position and enabling him to reap the fruits of his toil.

The distribution of banks according to the Reports furnished by the same 195 establishments shows in the like year (1883) that the highest number of banking associations and members was in Lombardy; Venetia ranking next; then Emilia, the Marches and Umbria; and after them, Naples and Sicily.

With regard to the profits on the capital, the average amount earned by these banks is stated at nine per cent. per annum, 'with a tendency to increase.' This is a good record, if we consider the youth of many of the banks included in the return. The reserve fund is fed by sums carried to it from the annual profits, and its average amount in 1885 ranged from one-third to one-fourth of the amount of the capital stock of the banks. These profits are allocated in a methodical manner, and their distribution in 1882 may be taken as a sample. Dividends and interest on capital absorbed, 79·67; reserve fund, 10·65; Board of Directors, 1·51; gratuities to clerks and directors, 4·81; charitable, 1; surplus brought forward, 2·36. Before these net profits arise, the expenses of management are of course deducted. The salaries stand at an average of 35·20, and sundry expenses at 27·51 in 1882; while income tax alone is 31·01, and sundry taxes are 9·28 for same period. This cost of management is moderate; and a calculation on the figures makes it to be 8s. 9d. per cent. of deposits; the Scotch banks' average having been stated in the parliamentary inquiry of 1875 as about 21s. per cent.—a striking difference.

These Italian banks do not appear to be banks of issue; but a novel feature is observable in glancing at their published accounts during the period of their existence. In 1871 a sum of £598,232 *buoni di cassa*, or cash coupons, appeared to be in circulation, and stood then at the banks' debit. This sum gradually dwindled down to £11,680 in 1876, and in 1877 to nothing. The deposits in guarantee of this circulation were in 1871, £325,172, which diminished each year, till they reached £54,120 in 1875, and in 1876 nil. There is no doubt that these banks cause a demand to spring up for more currency, for they

give rise to a multiplicity of small transactions, whose settlement cannot be expressed by book-entries, but must take the form of notes or coin, which will readily pass from hand to hand. The presence of so many peasant-proprietor and small agricultural shareholders helps to swell the number of operations on this restricted scale.

Agriculture has drawn largely on the People's Banks in Italy, and the number of persons following this industry will be best seen in figures. In 1884, out of 208 banks, there were 44,431 agriculturist members, of whom 9173 were large farmers, 30,604 small farmers, and 4654 peasant labourers. In Southern Italy, People's Banks have been most developed, and have been mainly instrumental there in opening up agriculture, which stagnated formerly through the combined evils of misgovernment and usury. It may not be generally known that in this country there is much usury practised, the rate charged being ten per cent., and the security exacted being for the most part personal. These agricultural loans are well managed in Italy. As they are granted for six months with a prospect of renewal, the banks do not advance the amount until an equivalent bond can be floated by them for the same period, thus securing that their own money is not indefinitely tied up. These bonds are issued at four per cent., and sometimes at four and a half and five per cent. per annum.

The kinds of operations in distributing credit by the banks average as follows: Loans on shares or personal securities, 25·24; discount of bills, 50·34; advances upon stocks and goods, 14·25; payments in account current, 10·17. Of these, Lombardy and Calabria appear to have cultivated advances on stocks to the extent of 21·50 and 32·80 respectively; while bills in Sicily stood at 86·26 in the year 1881. Before loans are granted, one-half of the shares must be paid up. All applications must be approved by a special Discount Committee (*Comitato di Sconto*). A register is kept of each member and his maximum credit, the register-keepers being members elected by general assembly, namely, Directors, Controllers, and members of Discount Committee.

These banks have drawn up the most minute instructions regarding every point likely to arise in connection with their banking practice; and their balance-sheets in their fulness of information are models of what such statements should be. In short, their system of organisation is as nearly perfect as can be.

With reference to these loans, the question may be asked: What rates do these banks charge? In the words of the Report: 'They vary between four and a half per cent. and ten per cent., the higher ones prevailing in the central and southern regions, particularly in Basilicata, Puglia, and Sicily.' In addition, a commission is often charged from one-tenth to two per cent.

As regards the interest allowed, the rate on current accounts ranges from two to six per cent., the lowest rates being in Upper Italy, where four and a half per cent. sometimes obtains in Venetia and Emilia. The rate of interest on saving deposits does not alter much, being a little higher than on the other deposits, and usually from three to six per cent., an extra allowance being made in some special cases of thrift. Interest-bearing bonds yield three to six per cent. of

interest, while re-discounting is done at from four to five per cent. on an average.

It is stated by Signor Luzzati, the great founder of People's Banks, that these rates compare favourably with those of the Credit Unions of Germany, where the bank rate is much lower as a rule. He also points out how the tendency of the Italian banks has been to reduce interest and commission of late, thus cheapening the terms on which money can be raised.

The management of the People's Banks has been already alluded to as of an economical character. The paid employees are few in number, consisting of a Business Manager, Cashier, Book-keeper, and Auditor. The salary of a manager has been occasionally fixed at £60 as what is considered fair remuneration; the cashier at £52; and the bookkeeper at £44. A gratuity allowed out of the profits serves to quicken the zeal of the staff.

The shares of the banks have a maximum value of four pounds, while two-pound shares are recommended and generally adopted, only a few (thirty-one) being over that amount at the close of 1885. They thus reach the class for whom they were intended, and it may be stated incidentally that the small loans always get a preference over the large ones.

The object of these banks is avowedly to benefit production, and it may with truth be said that they are admirably fulfilling their purpose. They are now settled institutions enjoying public confidence, recommended by the government, and possessing a large and increasing membership. They have without doubt found a congenial sphere of operation, and they have built up from the very bottom of the social structure, till now a stately edifice has been reared as the work of their hands.

WHO DID IT?

A STORY IN FOUR CHAPTERS.

By H. F. ABELL.

CHAPTER I.

'WHAT, sir! You have the face to come here and say that you want to absent yourself from the office to-day for the purpose of playing cricket! Once for all, Mr Richard, let me tell you'—

'Now, look here, uncle. What on earth's the good of working yourself into an apoplexy about nothing? We are playing Belford to-day. It's the great match of the season, and I must play, because they depend on me. There's no business doing, simply because all Colyton will be at the cricket-field; and I think it's awfully hard lines on a fellow that he can't get a little recreation now and then, especially when he works like a nigger and there's no need for it.'

'No need for it! Because a parcel of idle gossips talk about me as being a millionaire, and look upon you as a millionaire in prospective, you choose to think that there's no need for you to work as I have worked, and as your father did before you.—Don't you delude yourself into a belief in any such nonsense, and just remember that by a stroke of the pen'—

Scene—Old Jethro Seaton's study at Colyton Hall. Speakers—Old Jethro himself, a retired solicitor, reputed of great wealth, but as careful of every penny spent, and as careless of his own appearance, as if he were a pauper: and his nephew, Dick Ottery, a fine athletic young fellow of five-and-twenty, who with his sister Mary, now seated at her work in the window, had been left orphans at an early age under the guardianship of their uncle.

'I suppose you mean that you'd disinherit me?' retorted the young man.

'Yes, I do,' said Uncle Jethro emphatically.

'Which would be a peculiarly just and graceful proceeding, considering that my father helped you to make your money,' growled Dick. 'I suppose you'd leave it to that silent, sneaking fellow Claude Shute, who comes pottering and smelling about here after Mary?—I tell you what it is, uncle, I'm getting jolly sick of this sort of thing. Here am I condemned to drudge away at your office day after day from ten to six, just as if I was a poor banker's clerk, with hardly enough pocket-money to pay for beer and 'baccy, just because you won't be fair and treat me like a man, instead of like a boy.'

'Very well, then, sir,' roared the old gentleman, who, although he was seventy, bent, wizened, and gouty, had sound lungs. 'Go and make a way for yourself in the world, and see how admirably qualified you are to fight an uphill battle! Try it; you have my permission; I daresay I can fill your place at the office easily enough.'

'If it wasn't for Mary, I would,' replied Mr Dick, angrily. 'But I know that if I went, Claude Shute would be after her.'

The girl rose from her seat—a pretty girl, with a kind, rather a sad face, and laid her hand quietly on her infuriated brother's arm, saying: 'Do keep still, Dick, for my sake;' and added in a whisper: 'Go off to the cricket-field; uncle's bark is always worse than his bite.'

Dick would have perhaps taken her advice; but the old man's next speech stung him to the quick. 'Well, sir,' he said, 'and if Mr Shute does choose to pay his attentions to your sister, why shouldn't he? He's every bit as good as you are by birth, and a great deal better in breeding.'

'That sneaking, short-sighted muff as good as I am!' exclaimed the young man. 'Looks like a Socialist or a Moonlighter—that's what he looks like; and I daresay, if you took the trouble to inquire into his antecedents, you'd discover some rum truths.'

'Dick!' whispered Mary, 'remember you are insulting me, when you speak like that.'

'You're only a woman, and can't see much beyond your nose,' retorted her brother. 'Because that fellow has the gift of the gab and can quote poetry and all that tommyrot, you think he's a what d'ye call it—a paragon. If the man could do anything—even play lawn-tennis, the last refuge of duffers—he'd be worth something. I'm not going to have a muff like that for a brother-in-law, and I'll tell him so pretty plain if he comes humbugging about here much more.'

'Mary,' interposed her uncle, 'they have discovered an old Roman *via* on Bury Hill, and the Archaeological Association are going to inspect it.

I may try and get as far, so don't expect me in to lunch.'

'Very well, uncle,' said the girl; and having helped the old man with his overcoat, she accompanied him to the door and bade him good-bye.

Dick took no notice of the old gentleman's departure, but remained at the window, whistling and gazing out at the tangled wilderness which had once been a pleasant, formal, old-fashioned garden.

Mary linked her arm with his and said gently: 'Dick, I am really almost ashamed of you. Poor old uncle is touchy and peculiar, I know; but you might respect him better than to talk to him as you do.—Remember, if he hadn't taken us to his house after father's death, things would have been very different with us.'

'He was only doing his duty,' replied her brother. 'He has no kids of his own. Father helped him to make his fortune, so that I'm blessed if I see under what peculiar obligation we are to him.—Well, I'm not going to stand it, and that's positive.—And just look here, Mary—I'm awfully fond of you and all that; but that fellow Shute is not coming here to spoon you.'

'Surely that is my business, Dick?'

'No, it isn't,' replied her brother. 'Uncle thinks that because he himself is learned and fond of reading, everybody else with the same tastes must be worth something. I know better, and I don't trust Mr Shute. I like a fellow who makes a little more noise, and your quiet mysterious men always make me suspicious.'

'Well, I can tell you that you are wofully mistaken about Claude.'

'I may be; that has to be proved,' answered Dick.—'And now, it's late, and I must be off to the field.' So saying, he hurried away, to reappear in a few minutes clad in flannels, and went out by the back door, for the cricket-field adjoined Jethro Seaton's property, and a path led through the tangled deserted garden to a door in the wall which opened on to it.

In truth, poor Mary Ottery's life was by no means happy and easy. Old Jethro Seaton loved her dearly, and was kind to her; but he required a great deal of loving in return, and translated the most trifling neglect and the most unwitting forgetfulness into want of appreciation and affection. Altercations between him and Dick were of daily occurrence, and, in spite of all the girl's efforts at mediation, seemed to get more bitter as the opponents respectively grew older. But worse than this by far was the extraordinary and, to Mary, unaccountable dislike entertained by her brother towards Claude Shute. Shute was certainly not one of those men who win popularity amongst their own sex, or who captivate the feminine eye so easily as do men of the hearty, true-Briton stamp of Dick. He was ordinarily a quiet, reserved, silent young man, although upon occasion he could blaze forth into a tropical fury which seemed suitable to his dark complexion and his generally oriental appearance. He had never feathered an oar, nor dropped a goal, nor fielded a ball in his life; but Mary knew him as a quiet, unassuming, studious English gentleman, and loved him accordingly—partly because perhaps his own nature harmonised

better with hers than would that of her brother's typical men—fine animals, but little else.

Dick Ottery had been gone about an hour, and Mary was alone in the gaunt, half-furnished old house, when Claude Shute came in. The girl greeted him joyfully, but she noted at once that he was sad.

'I am glad you are here alone, Mary,' he said. 'I am hipped and sick at heart, and I made up my mind that I would come and make a last appeal to you to put me out of my suspense. Will you decide my fate here now one way or the other? I have waited patiently, as you bade me wait two years ago; but hope deferred, you know, maketh the heart sick.'

'You know that what you call your fate, Claude, has long been decided,' replied Mary; 'but if you mean, am I ready to marry you, as I have promised, I cannot answer you as you would wish.'

'Are you still, then, afraid of the bulldog?'

'No; I am not afraid of him; but my mission in this house is to try and keep peace as long as I can; and if I were to leave it as your wife, such mischief would ensue between my uncle and my brother, that I should never cease to reproach myself for having practically withdrawn the only influence which might have prevented it.'

'But, Mary, surely it is not just that our happiness should be blighted simply because an obstinate old gentleman and a hot-headed young one do not choose to agree? We might wait ten years longer before our opportunity would come.'

'If I can wait, Claude, surely you can. But I do not think that it need be so long as that. Dick may marry, or—God forbid that you should think I am calculating upon such an event!—or my uncle might die. Remember, he is very old, and every month almost increases his ailments, although he does get about wonderfully. If Dick married, he would have concerns enough of his own to attend to without bothering about ours. If uncle should die, Dick would be a rich man, and would soon make Dolly Copplestone his wife. I can wait, Claude.'

Her lover was silent. 'Mary,' he said at length, 'do you think that your brother thinks I am afraid of him?'

'I daresay he does, Claude. You know he cannot associate an unathletic, unsporting man with any of the ruder virtues, such as pluck, hardihood, and so forth.—Why do you ask?'

'Because I would very soon show him that I am not,' replied Claude quietly; 'and it is this as much as anything—this notion that he thinks I am afraid of him—that makes me wonder if I am acting like a man in only coming to see you when I know he is out of the way.'

'No, no, Claude; you are doing so at my request.—Dick would be sure to insult you; and I do know that you have a temper, although I never feel it; you would fire out; there would be a regular row, and matters would be worse than they were before.'

'Well, Mary, you are generally right; at least I think so. But it is weary work waiting, and the cause for the necessity is to me rather humiliating. I wish your brother would marry Dolly Copplestone and take himself off. It's very hard for the happiness of two people to be dependent

on the whims of a prejudiced man. I've never done your brother any harm, and I wish none to come to him; and because I don't see the fun of running about in the sun after one kind of leather ball, or of rolling about in the mud after another, or of blistering my hands with an oar, or of getting my face knocked out of shape by a boxing-glove, he doesn't think I'm a fit candidate for the hand of his sister. So I must go on waiting either until he marries, or until'—

'Only for a while, Claude. Remember, that all things come to him who waits.—And now, will you mind if I go away and dress? I promised Dick faithfully that I would come on the ground to see Colyton beat Belford, and besides one meets friends on these occasions whom one rarely sees at other times.'

'Of course I don't mind, Mary,' said Claude; 'anything which makes you happy pleases me. But I'm fearfully depressed, and I don't seem to care for anything now.'

'That's very foolish,' said the girl, laughing. 'Faint heart—you know the rest.'

'I'm not faint-hearted; on the contrary, I seem to long to do something startling, so as to show Mr Richard that I'm not the poor lump being he takes me for.—Where is Mr Seaton?'

'He talked of going to Bury Hill with the antiquaries, but he changes his mind often,' replied Mary.

Claude stood for a moment, looked at his watch, embraced Mary, and left the house; whilst Mary dashed up-stairs to attire herself as became one who was reputed the prettiest girl and the best dresser in South Ruddyshire.

ORANGES AND ORANGE-BLOSSOM.

CONSIDERABLE confusion has arisen as to the precise date of the introduction of the orange into Europe. On the one hand, many writers assert that it has been known from the time of the Romans; while others as confidently allege that its importation can only be traced back to a comparatively recent period. Gibbon himself has fallen into the former error, and in the second chapter of his *Decline and Fall* includes the orange among the fruits cultivated in the Roman gardens. The *Aurea malo*, however, of the Latin writers were certainly not oranges; they may have been citrons, or were possibly nothing more than a light-coloured apple, similar to the golden pippin of our own time. Other authorities, without going back so far, state that the orange was imported soon after the Christian era, that it was growing in Italy in the fourth century, and was seen by the Crusaders, during their various expeditions, in Palestine. On the other hand, we are assured that it was unknown in any country north of the Mediterranean previous to the fifteenth century, and that all statements to the contrary are founded upon a mistaken interpretation of the facts.

These apparent contradictions have their origin in a lack of discrimination between the sweet and the bitter varieties of the fruit. The latter, which is the original stock and from which the former is derived by cultivation, is a native of India and China. Sir Joseph Hooker found it

growing wild in several districts south of the Himalaya, and it has also been noticed by Royle and other botanists. From India the Arabs obtained it in very early times—probably soon after the destruction of the Roman empire—and after spreading over Africa, it was introduced by the Moors into Spain, and thence made its way gradually over France and the neighbouring countries. The word *aurantium*, from which we get our word 'orange,' first appears in the low Latin, and is itself a corruption of the Sanskrit term *nagrunja*. The Arabian physicians had a high opinion of its medicinal qualities, an opinion which was subsequently shared by their European colleagues; and in the middle ages, the bitter orange occupied a high place in the pharmacopœia of all civilised practitioners. The sweet orange seems to have been first brought from China by Vasco da Gama and his companions in 1498, although, again, there is considerable uncertainty on this point.

There can be little doubt that the sweet orange is an offshoot of the bitter variety, obtained by careful cultivation, and that it was originally the Chinese gardeners to whom we are indebted for it. In fact, the connection between the two is of the closest description; and a number of experiments made by different observers distinctly show that, unless certain exigencies of soil and climate be satisfied, the sweet orange is very liable to 'cast back' to its original rusticity. Galesio indeed alleges that no such thing occurs, and that he never met with an instance of a 'bitter orange from the seed of sweet oranges, or of a sweet orange-tree from the seeds of bitter oranges.' These results are, however, exactly contrary to the experience of many other experimentalists.

The precise period when orange-trees were first brought into England is uncertain, but it was in all probability some time during the reign of Elizabeth. Their introduction, like that of many other things, has been ascribed to Sir Walter Raleigh. The only foundation, however, for this tradition would seem to be the fact that some of the earliest trees known in England were cultivated at Beddington, in Surrey, the owner of which place, Sir Francis Carew, had married Raleigh's niece. A part of those at Hampton Court are also said to have been among the earliest importations, a few of them, according to the assertion of the gardeners, being more than three hundred years old. That the orange-tree frequently attains a great age is certain; and it is a well-ascertained fact that many of those which are known to be at least a hundred years old appear to be in their prime, and go on bearing long after that age. It is even alleged that in the Azores there are trees which have produced fruit after their third century. We may take it, however, that as a general rule the orange is at its best up to a hundred years, and after that time begins gradually to decay.

It was during the reign of James I. that oranges were first imported into this country as articles of commerce; but it may be presumed that the quantity brought in was small and the quality poor. In any case, they were looked upon as expensive and fashionable luxuries, and cultivated with as much care for the table as are hothouse grapes in the present day. Every great house had its orangery, under which the trees were

placed, either growing in tubs or planted in the ground. These orangeries—of which many examples still remain, as, for instance, at Kensington Palace and at Kew—were merely greenhouses on a large scale, the glass resting against a high wall, so as to give a minimum height of some fifteen or twenty feet. It was from these that for more than a century the chief supply of oranges was derived; and country gentlemen vied with each other in the excellence of the fruit and the quantity produced.

On their first introduction into England, oranges seem to have been sold for about eightpence each, a sum equal to more than a shilling in the present day. By the middle, however, of the seventeenth century the ordinary price had come down to sixpence, as we know from Mr Pepys, who makes several doleful observations on the subject. He first 'saw them grow,' he tells us, in 1666 'at my Lord Brooke's at Hackney,' where some of them were 'green, some half, some a quarter, and some full ripe on the same tree; and one fruit of the same tree do come a year or two after the other. I pulled off a little one by stealth, the man being mightily curious of them, and eat it; and it was just as other little, green, small oranges are, as big as half the end of my little finger.' What pleasure Mr Pepys could find in eating 'little green oranges' the size of his finger-end, or what he expected the flavour to be, he does not tell us; but such a petty larceny seems unworthy of a gentleman dressed, as he proceeds to inform us, for the first time, in his 'new black stuff bombazin suit.' A year or two later he became better acquainted with the price, if not with the taste, of oranges, for, in March 1668, he went 'to the Duke of York's house to see the new play, where the house was, it not being one o'clock, very full. But my wife and Deb. being there before, with Mrs Pierce and Corbet and Betty Turner, they made me room, and there I sat, it costing me eight shillings upon them in oranges at sixpence apiece.' The same price is mentioned two months later, when, at the same theatre, 'there happened one thing which vexed me, which is that the orange-woman did come in the pit and challenge me for twelve oranges which she delivered by my order at a late play at night, in order to give to some ladies in a box, which was wholly untrue; but yet she swore it to be true. But, however, I did deny it, and did not pay her; but, for quiet, did buy four shillings worth of oranges of her at sixpence each.' By the commencement of the succeeding century, oranges had evidently much decreased in price, and were sold, as now, in the streets.

The usual price of an orange throughout the last century seems to have varied from threepence to fourpence, a rate which was high enough to make the home cultivation of the fruit still worth the expense.

During the early years of the present century, orange cultivation in England went altogether out of fashion and gave place to that of grapes. It is, however, difficult to see the reasons for this entire change of taste. One would have supposed that, notwithstanding the diminished value of the fruit, orange-trees were still worth growing for the sake of ornament. A more beautiful plant, or rather shrub, does not exist, and nothing can be handsomer than an orange-tree in the month of April

or May, when the white blossoms, and the yellow fruit of the preceding year, stand out against the vivid dark green of the foliage. On the Continent, it is better appreciated. In France and Germany, no country-house or garden of any pretensions is supposed to be complete without its set of orange-trees in their tubs, which are placed out in summer and taken in again for the winter. In the Tuileries gardens, as every visitor to Paris will remember, many hundreds are kept, some of which are said to be over three centuries old. The only place in England, however, where the custom is still maintained seems to be Hampton Court Palace, where also, as we have seen, a very venerable age is ascribed to many of the trees. The continental gardens are still supplied to a great extent, as were our own in the last century, by the growers of the Riviera or the neighbourhood of Genoa. As it is an extremely tedious process to raise the plants from seed, they are usually imported when several years old, and thus, by the time they reach more northern latitudes, have become somewhat expensive luxuries. In South Germany, where they are perhaps cheaper than elsewhere, an average price for a moderately sized tree is about six pounds of our money; but, of course, everything depends upon the shape and size, a 'scraggy' specimen being sold for much less, while an exceptionally fine one will be rated accordingly. There is, however, one spot in the British Isles where orange-trees are still grown, and what is more, are grown in the open air, and that is Salcombe, in Devonshire, not far from Torquay. Here they are planted in the open ground, as in Italy or Spain; and trees are pointed out to the visitor which, it is stated, have withstood the rigours of English winters for more than a hundred years.

The blood-orange is a mere variety of the sweet orange obtained by cultivation, and appears first to have been raised by the Spanish gardeners in the Philippine Islands, from the capital of which (Manila) it, together with the well-known cigars, formed at one time one of the chief articles of export. On its first appearance in Europe it excited a considerable sensation; and in the last century, very high prices were demanded for the trees which bore the wonderful fruit. None, however, now come to us from Manila, our supply being derived almost entirely from Malta, where great pains and attention are bestowed upon their cultivation. It was for a long time supposed, and indeed the idea is not yet quite extinct, that blood-oranges were produced by the grafting of the orange with the pomegranate; but there is not the slightest foundation for this belief.

Of the immense numbers of oranges yearly imported into England, the greater part come from Portugal, Spain, Sicily, and the Mediterranean countries. The best, however, if we except the newly introduced Jaffa oranges, are still brought from St Michael, the largest of the Azores. They have the peculiarity of containing few or no pips, and their cultivation forms one of the chief industries of the island. The average annual yield of each tree is from seven hundred to a thousand; but some old trees produce much more, and continue to bear, it is said, for two or even three centuries. In the year 1878, four hundred thousand boxes, each containing about four hundred oranges, were exported to England; but, as

already stated, these hundred and sixty millions form but a small part of the total quantity consumed in the British Isles. It is evident, however, that the whole sum, if reckoned out, would present such an array of milliards as to convey no very clear idea to the ordinary intelligence.

To some people, the chief charm of the orange-tree lies in its beautiful and fragrant blossoms, and it seems strange that it is not more cultivated in our hothouses on this account alone. Nothing can be more delicious than the perfume of the orange-flower, although it is possible, according to the opinion of some over-sensitive individuals, to have too much of it. There are, for instance, places in Spain where it certainly is rather overpowering; and at Seville, in the month of April, the whole air is laden for several weeks with the strong pungent odour. To most of the visitors to that picturesque city this can only be a delightful experience; but there are others who allege that the intensity of the scent, or rather perhaps its persistency, night and day for so long, produces headache, and even nausea. Of the ubiquitous blossoms themselves, little use is made in Spain. In some of the convents, the nuns employ a certain quantity in the manufacture of orange-flower water, which they dispose of at a ridiculously low and merely nominal price; but which, by the time it has been retailed in England at a moderate profit of several hundred per cent., becomes almost as dear as an ordinary perfume. At Nice, however, and along the Riviera, precisely in that region which in the last century supplied our gardeners with their orange-trees, a considerable trade has sprung up in orange-blossoms. They are despatched in boxes to all parts of Europe for the purpose of being fashioned into bridal wreaths, or the wreaths themselves are sent ready made up, at prices varying from a few francs to almost a small fortune. As regards the latter point, the time of the year of course makes a considerable difference, the supply being attended with more difficulty in autumn and winter than in the spring, and is effected, it is to be supposed, by a system of forcing similar to that which enables our florists to produce winter roses and lilies of the valley at Christmas.

The custom of wearing orange-blossom at weddings is of comparatively recent date with us. It came to us, like most other female fashions in dress, from the French, who in their turn had derived it from Spain. In the latter country it had long obtained, and is said to have been originally of Moorish origin. There is, however, an old Spanish legend which gives a different account of its introduction. According to this, soon after the importation of the orange-tree by the Moors, one of the Spanish kings had a specimen of which he was very proud, and of which the French ambassador was extremely desirous to obtain an offshoot. The gardener's daughter was aware of this, and in order to provide herself with the necessary dowry to enable her to marry her lover, she obtained a slip, which she sold to the ambassador at a high price. On the occasion of her wedding, in recognition of her gratitude to the plant which had procured her happiness, she bound in her hair a wreath of orange-blossom, and thus inaugurated the fashion

which has become universal. As the orange was introduced into Spain at a very early period by the Moors, this legend sufficiently establishes the antiquity of the custom as far as that country is concerned, although many centuries elapsed before it spread over the rest of Europe. Up to forty or fifty years ago, it was the practice for ladies to be married in hats or bonnets; and the fashion of dispensing with the bonnet seems first to have established itself after the example set by her present Majesty on the occasion of her wedding in 1840. 'Her dress,' says the *Annual Register*, 'was a rich white satin trimmed with orange-flowers, and on her head she wore a wreath of the same blossoms, over which, but not so as to conceal her face, a beautiful veil of Honiton lace was thrown.' For some years after this, however, bonnets were still often worn at weddings, the orange-flower wreath, natural or artificial, being placed on them, and not directly on the head. It is probably not more than thirty years ago that they were finally dispensed with and the wreath and veil substituted. Even in Germany, the time-honoured chaplet of myrtle, to which there are so many allusions in literature and poetry, has now been discarded in favour of orange-flowers; and there seems little reason to doubt that this custom, now become universal, and pretty and appropriate in itself, will continue to be followed for a long time to come.

UNEXPECTED ANSWERS.

'I WOULD like my bill paid,' said a tailor to an impecunious customer.—'Do you not owe any one anything?' asked the debtor.—'No, sir; I am thankful to say I do not.'—'Then you can afford to wait,' was the answer as the customer walked away.

A country clergyman was impressing upon his gardener the importance of his giving due attention to his utterances in the pulpit, and told him to provide himself with a pencil and paper to take notes of any passages which he particularly dwelt upon. Next Sunday morning he was glad to perceive John busily following his advice. After the service he accosted him on his way home and asked to see his notes. After some demur John produced his paper. To the clergyman's astonishment, it was scrawled all over with unintelligible words and sentences. 'Why, John, this is all nonsense,' he said, somewhat indignantly.—'Deed, sir, to tell the honest truth, I thoct that a' the time ye was preaching!'

An Irish girl who was servant to a lady was complimented by her before company on the elaborate ornamentation of a large pie at dinner. 'Why, Bridget, you are quite an artist. How did you manage to do this so beautifully?' she inquired, thinking to rally her for the company's amusement.—'Indade, it was meself that did it, mum,' said Biddy with a malicious grin. 'Isn't it purty, mum? I did it with your false teeth, mum!'

A notorious miser was once presented by a clergyman with a pamphlet on almsgiving. Seeing him some time afterwards, he asked him what he thought of it. 'It's very fine, sir.'—'Well, I trust you will act up to its teachings,' said the minister. 'You would perceive the great necessity of charity being freely given.'—'So

much so,' answered the old niggard, 'I have a great mind to turn beggar myself.'

An English nobleman travelling incognito in the United States and wishing to enjoy his trip free from all the strict etiquette of his life at home, was one day annoyed by a negro waiter loitering about the room, although he had several times told him he did not require him to wait table. At last he peremptorily ordered him to leave the room.—'Excuse me, sah,' said Sambo, with a look of immense importance.—'excuse me, but I'se 'sponsible for de silver.'—This same nobleman relates that while sleeping in a remote Western hotel after a long day's journey, he was awakened early in the morning by a black waiter. Feeling rather tired, he went to sleep again, but in a short time was again awakened by the bed-clothes being quietly pulled off.—'What do you mean, you black rascal?' he indignantly demanded. 'Can't you let me sleep in peace?'—'Guess you can sleep as long as you like, sah,' replied Cuffy, 'only I must hab de sheet anyhow, 'cause dey're waitin' down-stairs for de big white tablecloth!'

A gentleman recently married was continually expatiating on the beauties and good qualities of his better-half, much to the disgust of his friends, who were somewhat dubious of the lady being such a paragon of perfection. One day, after listening to a big dose of fulsome praises about the lady, a gentleman remarked that it was quite right his friend should be blessed with the hand of such a treasure.—'How do you make that out?' asked he. 'What special right had I to her?'—'By the law of nations, of course, as the first discoverer.'

In a certain town in the north of Scotland there lived a barber who was somewhat addicted to frequent bouts of drinking. One morning after a deep boose he was shaving the parish minister, who, observing his hand was somewhat unsteady, and that he had drawn blood once or twice, solemnly remarked: 'James, my friend, it's a very sad thing to see a man a victim to strong drink.'—'Deed, it's that, sir,' complacently answered the barber; 'it's a very bad thing, and mak's the skin unco tender.'

'Well, Pat,' said a victorious general to a soldier after the battle, 'what did you do to help us to win this great victory?'—'Do, yer honour? Why, I walked bowldly up to one of the inimy and cut off his fut.'—'His foot! Why didn't you cut off his head?'—'Ah, sure, yer honour, an' that was off already.'

An American Professor attempting to explain to a little girl the manner in which the lobster casts his shell when he has outgrown it, remarked: 'What do you do when you get too big for your clothes? You throw them aside, don't you?'—'O no; we let out the tucks!'

A confirmed bachelor happening to see a lady looking at a picture representing a man on his knees before a beautiful woman, indignantly exclaimed: 'Before I would bend my knee to a woman, I would go and hang myself. Do you not think it would be the best thing to do, madam?'—'It would certainly be the best for the woman,' was the sarcastic reply.

Dr Abernethy was once called in to attend a man who had had a somewhat stormy altercation with his better-half, and found the poor man with his face all bleeding and marked with the points

of her finger-nails. The worthy Doctor could not help remonstrating with the woman upon her conduct. 'Madam,' he said, 'are you not ashamed of yourself, treating your husband like this, your husband, who is the head of the house—the head of all—in fact, *your* head, madam?'—'Well, Doctor,' fiercely returned the virago, 'and am I not at liberty to scratch my own head?'

Having purchased some butter from an Irish-woman, the merchant on weighing the lumps found them all light weight, and challenged her with trying to cheat him.—'Shure, it's yer own fault if they are light,' said Biddy; 'it's yer own fault, sir; for wasn't it a pound o' soap I bought here that I had in the other end o' the scales when I weighed 'em!'

'You'll grow up very ugly, Daisy, if you make faces.'—'Will I, auntie? Did you make faces when you were a little girl?'

At an examination at the College of Surgeons, a candidate was asked: 'What would you do if a man was blown up with gunpowder?'—'Wait till he came down,' was the somewhat cool reply.—'Very good,' continued the Professor. 'And suppose I was to kick you for such an impertinent answer, what muscles would I put in motion?'—'The flexors and extensors of my arm; for I would at once knock you down.'

A clergyman reprimanding one of his church members for quarrelling so frequently and loudly with his wife as to be a source of continual annoyance to the neighbours, remarked that the Scriptures declared that man and wife were one. 'Ay, that may be,' answered the delinquent; 'but if you were to pass when we were at it, you'd think there were a score of us.'

An auctioneer in Edinburgh of the name of Martin was one day selling some books, and not being much of a scholar, he made some awkward attempts to unravel the titles of some foreign works amongst the number. At last a French work was put up, and a young swell, thinking to have a laugh at the auctioneer's expense, asked him to read the title again, as he did not quite understand it.—'Oh!' said Martin, 'it's something about manners, and that's what neither you nor me has ower muckle o'.'

Fénelon, who often bothered Richelieu for subscriptions to charitable purposes without any success, was one day telling him that he had just seen a capital portrait of him. 'And I suppose you would ask it for a subscription?' said Richelieu with a sneer.—'Oh no; I saw there was no chance—it was too like you.'

Doctor passing a stone-cutter's yard: 'Good morning, Mr Jones. Hard at work, I see. I suppose you finish your gravestones as far as "In Memory of," and then wait for some one to die, eh?'—'Why, yes; unless somebody's sick and you're doctoring 'em; then I keep right on.'

'You don't love me now, Tom, as you used to,' said a shrewish wife to her dejected husband; 'when we were married first, you often declared you were so fond of me you could eat me up.'—'Yes, my dear,' was the melancholy rejoinder; 'and I've been sorry ever since I didn't do it.'

A pompous but bald-headed merchant who had amassed a considerable fortune was continually informing people of the fact that he was a 'self-made man.' 'I say with pride, Mr Blank,' he

began to a stranger one day, 'I am a self-made man. Nobody helped me. I made myself'—'Well, well,' interrupted the listener, 'when you were about it, why the dickens did you not put a little more hair on the top of your head?'

As I and my wife, at the window one day,
Stood watching a man with a monkey,
A cart came along with a 'broth of a boy,'
Who was driving a stout little donkey.

To my wife I then spoke by way of a joke:
'There's a relation of yours in that carriage.'
To which she replied, as the donkey she spied:
'Ah, yes, a relation—by marriage.'

RECENT DISCOVERIES IN EGYPT.

AN interesting collection of antiquities has lately been on exhibition in London, consisting of the various objects brought to light by Mr Flinders Petrie during his recent excavations in Egypt at Hawera, on the site of the ancient Labyrinth described by Herodotus. These objects are not so very ancient—that is, they belong to the Ptolemaic and Roman periods, which, although dating back to about 300 B.C., is quite modern according to the Egyptian standard. Nevertheless, to many people these relics, which speak so eloquently of the manners and customs of the Romans in Egypt, from about the birth of Christ to 200 A.D., and of the preceding Ptolemies, better known to us historically than their ancient predecessors the Pharaohs, will be of more interest than those of far greater antiquity.

The first thing which strikes us is a series of portraits on wood, so perfect and fresh in appearance, that it is difficult to believe that they have been buried for nearly two thousand years; yet such is the case, for these portraits represent Romans interred during the Ptolemaic period. It is singular that the Romans in Egypt should have adopted the mode of burial of the Egyptians; but the faces and dress of these portraits are undoubtedly Roman, although they covered the heads of mummies beautifully and elegantly swathed in the numerous linen bandages peculiar to Egyptian burials, but more artistically arranged than was common in the more ancient mummies, for the crossings of the bandages form a beautiful honeycomb pattern of extraordinary symmetry, each panel finished with a gilt band. The board upon which the portrait was painted was bandaged in skilfully over the head, and thus the relatives might have the mournful pleasure of contemplating the features of the deceased whenever they pleased; and certainly no artist even of modern times could have more faithfully portrayed the individual than did the portrait-painter of two thousand years ago. They are evidently what are usually called 'speaking' likenesses. There is one of an old man, who might have been a general, or one of the Cæsars, in his white toga, every line and furrow of the face carefully delineated; whilst several of the ladies, and particularly two young girls, might be exhibited as likenesses of professional beauties of the present day. The material employed for these durable portraits was a wax medium, which has been employed with excellent effect in modern times, and might be used more frequently with advantage. The beautiful views of Greece in the *Neue Pinakothek* at Munich,

executed by order of the old King Ludwig, are of this kind; and we believe some of the pictures in the Houses of Parliament, Westminster, are also painted on wax.

The mummies with the portraits were generally deposited in unadorned wooden coffins with movable lids. These coffins, which are not made of slabs of wood, but of small pieces neatly joined, are raised a few inches from the ground upon four short feet; and beside them were placed the four canopic vases with animal heads, containing the viscera, such as are always found in Egyptian tombs. Several of these jars are exhibited by Mr Petrie, as well as some of the flint knives used ceremonially, long after the invention of iron, by the embalmers in making the necessary incisions in the body.

There are also to be seen funeral wreaths, one still adorning the head of a mummy, made of flowers, the species of which are still distinguishable; wheat, barley, and other seeds; grasses and leaves of shrubs. Still more curious are a number of toys, some of which are almost identical with those prized by boys and girls of to-day. There are spinning-tops for the boys, jointed dolls for the girls, and a rag-doll for baby; a wooden bird on wheels, and other animals, including a crocodile; a toy bedstead, and a sedan-chair in terra-cotta containing a lady, who can be moved at pleasure.

The domestic arts are represented by fragments of beautiful embroideries; a set of bobbins such as are still used for lace-making; a bundle of leather-workers' needles and awl; spindles, and a dress made of coarse linen, with two broad purple bands inserted, just as represented in some of the portraits—the purple bands probably denoting the rank of the wearer. There is also a pair of short knitted socks made to tie round the ankle, and with a separate division for the great toe; this, of course, was for the convenience of the wearer of sandals; but it is amusing to find that the 'fad' of the hygienists of the Health Exhibition is at least as ancient as the Christian era, only the Egyptians had a reason for separated toes, which those who wear boots have not.

Perhaps one of the most interesting of the objects discovered is a lens of thick glass resembling the bull's-eye of a lantern, but suggesting the possibility that the Egyptians might have known more of the magnifying power of glass than we give them credit for, and may even have possessed telescopes.

A large case at one end of the room in the Egyptian Hall, in which Mr Flinders Petrie's discoveries are appropriately exhibited, contains a beautiful collection of Egyptian antiquities of an older date than those we have been describing—hundreds of those well-known curious little images of gods in blue porcelain, jewels of gold, necklaces, rings, bracelets, and ear-rings, among which we noticed some fine pearls; numerous scarabæi, and other curious and interesting objects, serving to show the high development of art in Egypt at a very early period.

Where shall we look for the beginnings of that art? In Mr Flinders Petrie's collection we see it as it existed in Roman times; in the British Museum we can trace it back into far remote pre-historic times; but it seems even then as vigorous, and in many respects as perfect, as in the more

modern period. Yet buried beneath the magnificent ruins of the cities and tombs of the Pharaohs, and even incorporated with the tufa out of which these tombs were constructed, are found rude flint implements, telling of a time when all this magnificent civilisation had no existence. Where shall we look for the transition stage, the period between the users of flint implements and the builders of the Pyramids? and how shall we estimate the time which has elapsed since the valley of the Nile was first occupied by man?

The recent discoveries of Mr Flinders Petrie and fellow-workers have done much to elucidate doubtful points in Egyptian history. We are daily discovering proofs of the truthfulness of the writings of Herodotus. Lake Mœris and the Labyrinth are no longer myths; the Shepherd kings have been made known to us; and the Pharaohs of Joseph and of Moses seem to be identified. Who shall say how much more of the hidden story written on the stones and on the tombs of ancient Egypt may be revealed to us by the zealous explorers, of whom Mr Flinders Petrie is chief? Let us hope that the British Museum may be enriched by these recent finds.

D E A D.

A QUAIN old cottage was on a hill,
With latticed panes and a doorway low;
(I know not whether it be there still,
For this was many years ago).
And a lady was singing there all the day—
Singing, and moving to and fro;
But now she is under the damp brown clay
(For this was many years ago).

And there, the latticed panes outside,
The roses bloomed all white and red;
Oh, they were sweet in the summer-tide,
But in the winter they were dead.
The roses died in the winter cold . . .
It must be winter now, I know,
For the lady lies in the clinging mould
(But this was many years ago).

Then she would sing there, day by day,
And one would come over the hills at eve,
And oft they would pause in the little doorway,
Those dreamers of dreams that Love can weave.
And oft they would stand on the green hill's brow
When the winds were hushed and the sun was low—
What does he think of that old time now?
(For this was many years ago).

'The red-rose-bloom was on her cheek,
The summer sunshine in her hair;
And she is dead! . . . she does not speak,
But her eyes—they follow me everywhere!
And most, when falls the sombre night,
And wavering shadows blacker grow,
They haunt me with their mournful light—
A dream of many years ago!'

OXFORD PASS SCHOOLS.

'GREATS.'

AFTER the triumph of having at last actually passed 'Mods' (see *Chambers's Journal*, 14th May 1887) has a little subsided, our typical undergraduate, already in his third year, sees quite new prospects opening before him. That long and verdant path, strewn with roses, which awaited his willing steps after 'Smalls,' has now become a thing of the past; few and evil are his remaining days at Oxford: like Macbeth's witches, when he stirs his caldron, he perceives in it only 'Double, double toil and trouble.' As long as Mods occupied his gaze, the hugeness of the obstacle filled his horizon, and prevented him from looking beyond; but now that it is removed, he suddenly and to his amazement perceives that while on the one hand the greater part of his life at the 'varsity is over, on the other the major portion of his work there has still to be performed. Poor creature! He had imagined that when once Mods was passed most of his labours would be finished. On the contrary, he finds that they had little more than begun. He is now the proud possessor of two *testamurs*; but three more must be his ere he can claim that magic B.A. degree which does for a 'varsity man what the stamp of the royal mint effects for a sovereign.

Until two years ago, indeed, one more trial remained which had to be undergone by all alike—by the professional 'pot-hunter'—that is, the constant seeker after university rewards and aids to learning, who commences his career by getting a scholarship at Balliol, and finishes it by landing the Craven; and by the humble denizen of 'Teddy Hall' or 'The Tavern,' who considers six years a very reasonable time to consume in attaining to the status of a Bachelor of Arts. Appropriately to the history and destination of man, this meeting-place of manifold intelligences was theological, not to say polemical, in its character. Theoretically, it constituted one of the two

great divisions of the Second Public Examination; practically, it was the slightest and easiest of all Oxford schools.

Although the hand of change has laid its ruthless clutch upon 'Rudiments,' or 'Pass Divinity,' as it was indifferently termed, insomuch that since 1886 it has ranked merely as one amongst the many pass schools out of which the Passman can select the fatal three, it is still worth while to dwell for a moment upon its departed glories, before they vanish for ever into the limbo of a forgotten past.

The time required to prepare for this tremendous ordeal used to be differently estimated. A testamur in Moderations having been actually secured, it becomes the painful task of the being whose fortunes we follow to prepare himself for his other three pass schools. It is to be noted that he is no longer the lighthearted mortal he was of yore; a change has come over the spirit of the scene, and the realities of existence have begun to press heavily upon him. The Oxford dun, like Pale Death himself, knocks impartially at the doors of the rich—who have exceeded their allowance—as well as at those of the poor. All the extravagances of former days are now beginning to bear their acrid fruit; every post brings a bill; every knock may announce the appearance of a furious creditor. Bad enough it often is for the comparatively wealthy; but for the poor! Who can describe the agony of the ruined man, who feels that the whole of his previous history is one long record of waste—waste of time, waste of opportunity, waste of life! Too often he has the additional pain of knowing that he has destroyed by his mad prodigality the very home that nourished him. Parents and sisters are impoverished; he himself is compelled to expiate by a lifetime of drudgery and indigence the drivelling idiocy of his earlier years. It is evident that to such a man as this, to obtain his Degree is often almost literally a question of life or death. If he succeed, there are possibilities which may serve in some measure to mitigate the punishment

he has brought upon himself. If he fail—but here we cannot follow him—'tis too bitter! Enough has been told to show that the Passman is likely to toil for his Finals in a fashion very different from that which he formerly pursued. He palters no longer; all he can do he does, but, unfortunately, that is not very much. He infinitely desires now, probably, to 'get through' with all possible speed; but he is informed that he has at present no chance of success. By far the most difficult of the fences he has still to negotiate is Pass Greats. This school may be considered as representative in some sort of the old 'Great Go,' a kind of relief, or survival from, a former state of things: 'The last rose of summer left blooming alone.' It is indeed at once the most venerable and the stiffest of all Oxford Pass Exams., perhaps the only one which may be said to really demand some little exercise of the higher intellectual faculties. It is now that the Passman (as a rule) gets his sole glimpse into the upper regions of education. From the foot of the mountain he, as it were, looks up, and sees peak after peak piled high above him, each more inaccessible than the last. With awe he gazes, and at last turns away, feeling that 'the quest is not for him.'

At this point in their progress many men bid a long farewell to the classical pursuits which have occupied so many of their previous years. If they enter the Church, or if they attempt tuition, it is true that their classics will still be of service to them; and if they read for the bar—which comparatively few Passmen do—or become articled to a solicitor, it is possible that such Latin as they possess may be turned to account. But, with these exceptions, it is probable that very few non-honour men, when once they have obtained a *testamur* in 'No. 1 Group A,' ever again make the slightest use of the lore which they have acquired at the cost of so many weary hours, and of cash to an amount which is known to Paterfamilias alone.

His two remaining schools the Passman can elect out of a number which it is open to him to attempt; but as several of these are mathematical or scientific in their character—and therefore, of course, to be shunned like the plague—his power of picking and choosing is practically considerably restricted. The historical schools—English or modern European—are a frequent choice; and perhaps the greatest difficulty to be encountered in connection with them is the essay which has to be written during the exam. upon some subject of general interest discovered by the examiners. To indite a brief disquisition on, for example, 'Fairy Tales' or the 'British Constitution' may not seem a very stupendous feat to a man who has ever accustomed himself to use his pen and his brains—even though but one hour be allowed for the deed—but it is an almost impossible performance to a being who has never thought consecutively for so long a period before, and whose habitual language is a slang dialect, which, however forcible and expressive, is not adapted to literary purposes.

Thus, then, we have traced the steps of our hero from the moment when, as an unfledged—or at least 'unplucked'—nestling he entered the arena of the schools to bear away the crown

of victory from 'Smalls,' to the time when he has won his last *testamur* in Final Schools. One more scene still remains, in which we may take a glance at him before we bid him adieu for ever. It is a 'Degree day,' and the *apodyterium* of the Convocation House is thronged with young men, clad for the last time in undergraduate apparel. Within are to be seen seated many of the relatives of the aforesaid—principally ladies—who have come to see dear Tom, or Dick, or Harry take his B.A. Tom, Dick, and Co. have to wait in the outer portion of the building until they have all exhibited their bundles of hardly earned *testamurs*, paid the required cash, and inscribed their names in the university register. Each of the batches of men from the several colleges is presided over by a sort of sponsor, in the shape of a Fellow or Tutor from the same Society, whose duty it is to warrant the respectability and genuineness of his protégés.

As soon as the necessary preliminaries have been observed, the latter find seats for themselves—or at anyrate endeavour to do so—in the interior, and there become spectators of events. It cannot be said that the externals of the affair are very striking; in fact they might be described as a trifle dingy; but notwithstanding, there is not wanting a certain amount of impressiveness. The Degrees in the 'superior faculties'—namely, in Law, Medicine, and Divinity—are first conferred, that is, if there happen to be any candidates for the same—and then those in Arts; men who are about to become M.A.s naturally taking precedence of their juniors. In each case, though the formula recited varies, the proceedings accompanying it bear a strong family resemblance. The recipients of the Degree are introduced by some responsible authority to the notice of the Vice-chancellor, who sits in a chair on a sort of dais at the end of the chamber, and whose business consists in taking off and replacing his cap and in indulging in the prescribed Latin orations. At the conclusion of each such ceremony, the newly-made graduates retire to robe themselves in their appropriate vesture, and then reappear to make their bow to the 'Vice.' These Oxford garments are rather 'seedy'-looking articles, their prevailing black being usually only relieved by the colour of the hood. The gown of a D.D., however, is truly gorgeous to behold, and when seen suspended in a shop-window, is calculated to fill little girls with an awful respect. As the new Doctor of Divinity, clad from head to foot in black and scarlet, proudly displays his splendour to the public view, he vividly recalls the description of the serpent before the Fall given by a Sunday-school boy in reply to a young lady anxious to ascertain if her lessons had borne any fruit: 'If you please, 'm, you said he were a very 'andsome hanimal.'

We are keeping the would-be B.A.s waiting all this time; but, as this is exactly their actual fate, there is no harm done. When at last their turn comes, the names of the men of each college are read out separately, and an extraordinary phenomenon is then witnessed. The two proctors, who are stationed near the Vice-cancellarial chair, start forward, as if suddenly galvanised into movement, and precipitate themselves in a highly alarming manner upon the

narrow path which serves as a thoroughfare, apparently having just discovered some delinquent of whom they are going in chase. They seem to find out they have made a mistake, however, by the time they have got half-way down the room, for they stop with a jerk, turn round, and return to their former position. This strange piece of eccentricity on the part of these high disciplinary officials is due to an old custom, which allows any unsatisfied creditor to 'pluck' the gown of the proctor when he hears the name of his hapless debtor, and thus arrest the bestowal of a Degree until his claims have been satisfied. Probably 'the oldest inhabitant' would fail to recollect an instance of this right being exercised; but Oxford is a place where old customs long survive, and even after credit and its corollary, debt, have both been abolished by an enlightened legislature, we may look to see this one still perpetuated.

As their names are uttered, the contingent of youths from University or Balliol, or Merton or Exeter, stumble forward with much banging and shuffling, for, though there may be much learning, there is little space in the Convocation House. When they are drawn up in front of the 'Vice,' the Don, who is acting godfather, discharges his function by a slight bow, and perhaps a wave of his hand, as much as to say, 'There is no deception here, gentlemen;' and then the men for whom he vouches immediately give way to those from other colleges. When all have in turn been presented to the Vice, the latter gets up and unburdens himself of some remarks (in Latin), which he seems to have been longing to make. Then the new 'Bachelors of Arts' retire once more to the antechamber, and there abandon themselves to the 'pleasing pain' of putting on the *toga virilis*, and at the same instant disbursing coin right and left, here, there, and everywhere at once. All the vulture-like hangers-on of a college, scouts, porters, sub-porters, common-room-men, even the proctor's bulldogs, will audaciously demand tips, with much the same cool impudence, one would think, as the highwayman who in the good old times politely requested people to give him their money or their life. In one respect, the plight of the victim is even worse, for to him no alternative is allowed; to refuse is impossible: it is regular plundering, from which he is fortunate if he escape still in possession of funds enough to take him down.

And now that the play is at last fairly played out and the game is over, it may occur to some inquiring mind to wonder whether it was worth the candle. What has the fortunate graduate in truth gained in return for all the time and all the money he has spent in pursuit of his Degree? In the first place, it should be said that any words which may seem to have been spoken disparagingly of Oxford life and Oxford opportunities have been aimed against not the use but the abuse of these. It must be remembered that not above one-half of the undergraduates of the present day are Passmen; and of them many are far superior to the 'average specimen' whose typical character we have endeavoured to sketch. Still, it may be doubted whether, with the exception of men who intend to take holy orders, or again of men who intend to do nothing at all, it is, strictly speaking,

worth anybody's while to take a Pass Degree. Those who really make their 'varsity career a paying thing are the scholars, who afterwards develop into Fellows of their colleges. These are the men who win the prizes in the Oxford lottery; but it does not quite follow that all the rest of the tickets are blanks.

To take the lowest kind of benefit obtained—some amount of worldly experience must at least be secured. But further than this, it may be said that though it is certainly possible for men, as hundreds annually prove, to leave the university as essentially unlettered as they were when they came up, after all the achievement is a remarkable one. For those who have either eyes to see or ears to hear, there is an education apart from the schools. Culture and refinement are in the air; it is a man's own fault if he do not imbibe them. There is no other spot in Britain, perhaps in the world, where the past, the present, and the future are more closely united than they are here. All that activity of modern thought, all that movement of mind, which tend to produce results until now indefinable, here find fullest scope; for Oxford is no longer an oasis of Conservatism planted amidst a wilderness of change. It is a place keenly susceptible of impressions from without, and of which the pulse keeps true time with the heart of England. But there ever exists in the background the far-reaching influence of a thousand years, filled with imperishable memories, and indissolubly connected with events that are yet to come. The Past lives on at Oxford, dim and shadowy, it may be, but potent none the less; the very stones are historic. Ill befall the wretch who can find no good thing to say of the oldest and noblest of English homes of learning! Let a man set himself resolutely to draw out the good, and not the evil, from his surroundings, to lead the higher not the lower life which is there offered him, and—even though his name figure in no class lists—it will be hard indeed if he bear not away with him that which will raise him in the scale of being for the rest of his days.

THIS MORTAL COIL.

CHAPTER LII.—THE TANGLE RESOLVES ITSELF.

'You must never, never take it, Elsie,' Warren said earnestly, as Elsie laid down the paper once more and wiped a tear from her eye nervously. 'It came to him through that poor broken-hearted little woman, you know. He should never have married her; he should never have owned it. It was never truly or honestly his, and therefore it isn't yours by right. I couldn't bear, myself, to touch a single penny of it.'

Elsie looked up at him with a twitching face. 'Do you make that a condition, Warren?' she asked, all tremulous.

Warren paused and hesitated, irresolute, for a moment. 'Do I make it a condition?' he answered slowly. 'My darling, how can I possibly talk of making conditions or bargains with you? But I could never bear to think that wife of mine would touch one penny of that ill-gotten money.'

'Warren,' Elsie said, in a very soft voice—they were alone in the room and they talked like lovers—'I said to myself more than once in the old, old

days—after all *that* was past and done for ever, you know, dear—I said to myself: “I would never marry any man now, not even if I loved him—loved him truly—unless I had money of my own to bring him.” And when I began to know I was getting to love you—when I couldn’t any longer conceal from myself the truth that your tenderness and your devotion had made me love you against my will—I said to myself again, more firmly than ever: “I will never let him take me thus penniless. I will never burden him with one more mouth to feed, one more person to house and clothe and supply, one more life to toil and moil and slave for. Even as it is, he can’t pursue his art as he ought to pursue it; he can’t give free play to his genius as his genius demands, because he has to turn aside from his own noble and exquisite ideals to suit the market and to earn money. I won’t any further shackle his arm. I won’t any further cramp his hand—his hand that should be free as the air to pursue unhampered his own grand and beautiful calling. I will never marry him unless I can bring him at least enough to support myself upon.”—And just the other day, you remember, Warren—that day at San Remo when I admitted at last what I had known so long without ever admitting it, that I loved you better than life itself—I said to you still: “I am yours—at heart. But I can’t be yours really for a long time yet. No matter why. I shall be yours still in myself, for all that.”—Well, I’ll tell you now why I said those words.—Even then, darling, I felt I could never marry you penniless.’

She paused, and looked up at him with an earnest look in her true gray eyes, those exquisite eyes of hers that no lover could see without an intense thrill through his inmost being. Warren thrilled in response, and wondered what could next be coming. ‘And you’re going to tell me, Elsie,’ he said with a sigh, ‘that you can’t marry me unless you feel free to accept Whitestrاند?’

Elsie laid her head with womanly confidence on his strong shoulder. ‘I’m going to tell you, darling,’ she answered, with a sudden outburst of unchecked emotion, ‘that I’ll marry you now, Whitestrاند or no Whitestrاند. I’ll do as you wish in this and in everything. I love you so dearly to-day, Warren, that I can even burden you with myself, if you wish it: I can throw myself upon you without reserve: I can take back all I ever thought or said, and be happy anywhere, if only you’ll have me, and make me your wife, and love me always as I myself love you. I want nothing that ever was his; I only want to be yours, Warren.’

Nevertheless, Mr Alfred Heberden did within one week of that date duly proceed in proper form to prove the claim of Elsie Challoner, of 128 Blethingley Road, in the parish of Kensington, spinster, of no occupation, to the intestate estate of Hugh Massinger, Esquire, deceased, of Whitestrاند Hall, in the county of Suffolk.

The fact is, an estate, however acquired, must needs belong to somebody somewhere; and since either Elsie must take it herself, or let some other person with a worse claim endeavour to obtain it, Warren and she decided, upon further consideration, that it would be better for her to dispense the revenues of Whitestrاند for the public good, than

to let them fall by default into the greedy clutches of the enterprising pawnbroker in the Borough Road, or be swallowed up for his own advantage by any similar absorbent medium elsewhere. From the very first, indeed, they were both firmly determined never to spend one shilling of the estate upon their own pleasures or their own necessities. But if wealth is to be dispensed in doing good at all, it is best that intelligent and single-hearted people should so dispense it, rather than leave it to the tender mercies of that amiable but somewhat indefinite institution, the Court of Chancery. Warren and Elsie decided, therefore, at last to prosecute their legal claim, regarding themselves as trustees for the needy or helpless of Great Britain generally, and to sell the estate, when once obtained, for the first cash price offered, investing the sum in consols in their own names, as a virtual trust-fund, to be employed by themselves for such special purposes as seemed best to both in the free exercise of their own full and unfettered discretion. So Mr Alfred Heberden’s advertisement bore good fruit in due season; and Elsie did at last, in name at least, inherit the manor and estate of Whitestrاند.

But neither of them touched one penny of the blood-money. They kept it all apart as a sacred fund, to be used only in the best way they knew for the objects that Winifred in her highest moods might most have approved of.

And this, as Elsie justly remarked, was really the very best possible arrangement. To be sure, she no longer felt that shy old feeling against coming to Warren unprovided and penniless. She was content now, as a wife should be, to trust herself implicitly and entirely to her husband’s hands. Warren’s art of late had every day been more sought after by those who hold in their laps the absolute disposal of the world’s wealth, and there was far less fear than formerly that the cares of a household would entail on him the miserable and degrading necessity for lowering his own artistic standard to meet the inferior wishes and tastes of possible purchasers, with their vulgar ideals. But it was also something for each of them to feel that the other had thus been seriously tried by the final test of this world’s gold—tried in actual practice and not found wanting. Few pass through that sordid crucible unscathed: those that do are of the purest metal.

On the very day when Warren and Elsie finally fixed the date for their approaching wedding, the calm and happy little bride-elect came in with first tidings of the accomplished arrangement, all tremors and blushes, to her faithful Edie. To her great chagrin, however, her future sister-in-law received the news of this proximate family event with an absolute minimum of surprise or excitement. ‘You don’t seem to be in the least astonished, dear,’ Elsie cried, somewhat piqued at her cool reception. ‘Why, anybody’d say, to see the way you take it, you’d known it all a clear twelvemonth ago!’

‘So I did, my child—all except the mere trifling detail of the date,’ Edie answered at once with prompt common-sense, and an arch look from under her dark eyebrows. ‘In fact I arranged it all myself most satisfactorily beforehand. But what I was really thinking of just now was simply

this—why shouldn't one cake do duty for both at once, Elsie?'

'For both at once, Edie? For me and Warren? Why, of course, one cake always does do for bride and bridegroom together, doesn't it? I never heard of anybody having a couple, darling.'

'What a sweet little silly you are, you dear old goose, you! Are you two the only marriageable people in the universe, then? I didn't mean for you and Warren at all, of course; I meant for you and myself, stupid.'

'You and myself!' Elsie echoed, bewildered. 'You and myself, did you say, Edie?'

'Why, yes, you dear old blind bat, you,' Edie went on placidly, with an abstracted air; 'we might get them both over the same day, I think seriously: kill two weddings, so to speak, with one parson. They're such a terrible nuisance in a house always.'

'Two weddings, my dear Edie?' Elsie cried in surprise. 'Why, what on earth are you ever talking about? I don't understand you.'

'Well, Mr Hatherley's a very good critic,' Edie answered with a twinkle: 'he's generally admitted to have excellent taste; and he ventured the other day on a critical opinion in my presence which did honour at once to the acuteness of his perceptions and the soundness and depth of his aesthetic judgment. He told me to my face, with the utmost gravity, I was the very sweetest and prettiest girl in all England.'

'And what did you say to that, Edie?' Elsie asked, amused, with some dawning perception of the real meaning of this queer badinage.

'I told him, my dear, I'd always considered him the ablest and best of living authorities on artistic matters, and that it would ill become my native modesty to differ from his opinion on such an important question, in which, perhaps, that native modesty itself might unduly bias me to an incorrect judgment in the opposite direction. So then he enforced his critical view in a practical way by promptly kissing me.'

'And you didn't object?'

'On the contrary, my child, I rather liked it than otherwise.'

'After which?'

'After which he proceeded to review his own character and prospects in a depreciatory way, that led me gravely to doubt the accuracy of his judgment in that respect; and he finished up at last by laying those very objects he had just been depreciating, his hand and heart, at the foot of the throne, metaphorically speaking, for the sweetest girl in all England to do as she liked—accept or reject them.'

'And the sweetest girl in all England?'—Elsie asked, smiling.

'Unconditionally accepted with the most pleasing promptitude.—You see, my dear, it'll be such a splendid thing for Warren, when he sets up house, to have an influential art-critic bound over, as it were, not to speak evil against him, by being converted beforehand into his own brother-in-law.—Besides which, you know, I happen, Elsie, to be ever so much in love with him.'

'That's a good thing, Edie.'

'My child, I consider it such an extremely good thing that I ran up-stairs at once and had

a regular jolly old-fashioned cry over it—Elsie, Arthur's a dear good fellow.—And you and I can be married together. We've always been sisters, ever since we've known each other. And now we'll be sisters even more than ever.'

THE END.

THE OPAL MOUNTAIN OF FAROE.

STROMOE, the chief of the Faroe Islands, is only about twenty-five miles long by six or seven in breadth; yet in its small area it includes two wonderful mountains. One of these is known as the Opal Mountain, because it contains much precious stone of the opal kind. The other is the Myling Head precipice, a headland two thousand two hundred feet above the sea-level, and perpendicular. Humboldt, the great traveller, has pointed out how very rarely this or that rock with a reputation for perpendicularity is really perpendicular. But the Myling Head mountain positively hangs over the sea at its summit, so that you may watch the waves beating its base half a mile beneath you.

With the intention of visiting these two phenomena of nature, the writer left Thorshavn, the capital of the Faroes, one August morning. One can never depend on Faroe weather; and though at the time I started from the steep stony little streets of the town the sun was bright over the sea, and a brisk north wind was blowing, ere I got to Kollefjord the whole land might be bathed in fog. However, the weather kept good, and so I did not lose my way in the bogs and mountain uplands between Thorshavn and Kollefjord. Eight hours of soft and hard going had made me tired enough by the time I was skirting the blue waters of the fiord towards my destination for the night. I passed several knots of Kollefjord-men in their red caps, lounging by the water-side, or getting into their boats for the evening fishing. They were astounded to see a stranger, and stopped singing until I was out of sight.

At about seven o'clock I reached the farm to which I bore a letter of introduction. A man who spoke excellent English had joined me in the valley. From sheer love of England and the English, he assured me, it would delight him to interpret between me and the bonder. He had fished for several years at Grimsby, and served on a Scotch smack; but the needs of an old mother, and an increasing family of his own, had tied him to Faroe for the last five years.

We halted at the door of a house fronting some haybeds—the Faroe cultivable patches are small and rectangular, and environed by trenches: literal beds—which sloped to the water's edge about two hundred yards distant. On the grass in front, a number of fleeces were spread to dry, and home-spun jerseys of blue, crimson, green, yellow, and white wool. A rush of dogs ensued; several light-haired sturdy boys and girls followed the dogs, and then uprose a cry of 'Fader! Fader!' One of the most perfect conceivable specimens of stalwart humanity strode out of the house in response to this cry, and accosted my guide. In his hands was a part of a cow's skin, out of which he had been employed in cutting a pair of moccasins; and he was redolent of the hay of his own

beds before us. No sooner did the farmer understand that he was called upon to receive a guest, than his fine hearty face flushed with elation. He lifted his turban with exquisite rare courtesy, and bowed his great body a quarter of its height from the ground. From my shoulders he unstrapped the knapsack with nervous haste, and then showed the way into his house, and besought me to take a seat in the *rogstue* (kitchen), where half a score of perturbed men and women were grouped about the fire. But I had scarcely entered the room when the lady of the house hurried after me, and with smiles of cordiality and vociferous upbraidings of her husband for blundering so obtusely, bowed me out of it, and into the guest-room proper.

On such short notice and at such a time of day, would she take me in? I asked.

But there was positive reproach in the worthy woman's tone and face when she asked in reply if it were likely she should do otherwise. There were others in Siov who would be only too ready to receive a stranger; but I had been recommended to her care, and she hoped I would confide in her. The best of everything in the house should be at my service, from the best feather-bed, over and under, to the best silver and the largest eggs; and her man himself should accompany me up the Opal Mountain, out to the fishing, or anywhere else whither I might require him. She herself would forthwith prepare supper, if I would tell her what I liked best.

Before leaving me, she uncovered and opened the window of the room. The scent of new-cut hay came in straightway with a light breeze from the sea. The evening shadows were creeping over the still fiord; but there were spaces of sunlight on the gray rocks which rose steeply a thousand feet or more from the water's edge on the other side; while at the end of the valley the summit of great Skelling himself (the highest mountain of Stromoe), deadly dark as to his lower parts, was swathed in a thick fold of white cloud. It was a scene of beauty and tranquillity; and the slow chant of some home-returning fishermen, with the faint rhythmic splash of their oars, came through the air, softened to solemnity.

'And the weather?' I asked of my jovial host during supper.

'Not so good,' said he. 'One day, good weather—not two.—But if you will ascend the mountain to look for the stones, it will not matter very much what the weather may be.'

Yes; I was determined to climb Odnadalstind (the Opal Mountain) on the morrow, and see if I could not find an opal worth carrying away: this, with the help of a dictionary, I made him understand. And then, for my encouragement, he told me that not long ago a gentleman of Westmannhavn (on the west coast of Stromoe) had picked up in the neighbourhood a superb stone worth many hundreds of crowns. Nothing could be easier than to make the ascent—under his guidance. He knew all the likely places; indeed, no one else had any business to know them. It was his own mountain, or rather his as the king's deputy; and for it he paid the king a hundred crowns rental. It gave grazing to eightscore sheep, a few cows and a bull, and living-room to sundry droves of geese which liked the breezy uplands; there were hares on it and some snipe:

and this, with what he got by selling his bits of opal to Copenhagen jewellers, surely made up a fair equivalent for the hundred crowns. Moreover, it was the third highest mountain in Faroe, and this was an additional feather in the cap of the good man's pride.

Oh yes! if he was to let go the mountain, which had come to him from his father and his father's father to the sixth generation, there were many Faroe people who would be glad enough to lease it at the same price—if they could get it. But the mountain would probably stay in the Johanneson family as long as Denmark was a monarchy. 'For'—with a look of approval at his wife—'there were two young boys born to him already, and both were sound in limb and wind.' The bonder had married twice; and my hostess, his second wife, and mother of the boys, was sister to his first wife. Such second alliances are much fancied in Faroe.

After supper, the good people left me to myself. It is not customary for the Faroese to use artificial light in summer; but they brought me their best winter's lamp, and then genially wished me good-night (*sov vel*). The bonder went to make me a pair of cowskin moccasins for the mountain climb; for, though he had unbounded admiration for my English boots, he considered them unfit for the wet and rocky surface of the Faroes.

A word about the room in which I was installed here at Siov, and which was fairly typical of the average guest-chamber of a Faroe farmhouse. It was wholly of wood, and clean in every part. The ceiling was so low that the antique gun which hung across it could be reached with ease. In one corner of the room was a sewing-machine; for my hostess was an expert dressmaker, having lived many years in Copenhagen. In another, two chests of drawers were set on end, forming an imposing piece of furniture which touched the ceiling. The third corner was occupied by a cupboard with a glass door, within which the family plate and china were displayed with some little ornamental skill. A sofa stuffed with soft straw stretched athwart one side of the room; and three or four heavy, hard, unpolished chairs were disposed about it. A couple of tables and a noisy clock made up the run of the furniture proper; though in the window there were some plants, existing, not flourishing; and on the walls were an oval gilt mirror, and a picture showing the silhouette heads and busts of three gentlemen (ancestors of my hostess), with plenty of hair, and noses of remarkable and varied developments. From the guest-room a little door allowed ingress to the bedchamber, which just held a bed.

The next day broke lethargically, and it was early apparent that the bonder was an experienced meteorologist. A dense fog pervaded all the valley. It was the phenomenon called by the Faroese *Pollamjörki* (from the Norwegian *Poll*, a little circular channel, and *mjörki*, a fog), inasmuch as it did not cover the tops of the mountains, which stood up from it like weird black trunkless giants. And when the sun came out and shone on the mountain-tops, making them lustrous through the lower mist, the effect was very eccentric. But, a little later, *Pollamjörki* changed to *mjörki* proper, which is a more unwelcome visitation. The fog rolled itself up, as it

were, and ascended the hillsides in eddying masses. Soon all the summits were wholly hidden, and their bases also, save for a few dozen yards, and the valley was filled with a light white mist. It seemed the most hopeless of days for mountain climbing, and I was quite prepared for a negative from the bonder. But, to my joy, he expressed contempt for the weather. He came in to me with my cowskin shoes in one hand, and a massy chisel and hammer gripped in the other, and his hearty face was red with the washing he had just bestowed on it in the cold mountain stream outside his door.

Odnadalstind is a mountain very conspicuous from the southern part of Stromoe. Its shape is that of a well-formed isosceles triangle, on the apex of which is a mass of rock congestion rising to a very limited actual peak. From Siov the ascent is easy, though in places the cliffs overhang in a rather troublesome manner. Only at the summit is there anything that need vex a nervous head. Here, however, for forty or fifty feet, the crags rise precipitously, and a firm but dainty tread is necessary in the climb. As for the view from the summit, it is said to surpass that of Skelling or Slatteritind (Faroe's king, 2890 feet, in Osteroe). Most of the Faroes are discernible from it. But of this, alas! I can say nothing, for the fog was persistent in its intervention between us and the land or sea level, though above us the sun shone with a tantalising brilliancy. From spaces of boulder-strewn heather we passed to steep inclines of broken rock; thence to much moss, wet with the saturation of subterfluent springs; and finally a long toil up a slope of painful shale brought us to the foot of the peak. A great bow of light cleft the fog just as we attained the summit, and seemed to augur a clearance; but this fog-bow was only a momentary though charming illumination.

Once we were on the summit of his mountain, the good bonder began to be patently oppressed by the cares of responsibility. He showed a solicitude for my safety that, howsoever laudable, was very ridiculous. By gestures rather than speech—for his language could not rise to the occasion—he gave me to understand the awful nature of the abysses on either hand falling from the foot of Odnadalstind's crest; and at first his hands flew to my neck or my arm if I did but move an inch, and he gripped like a vice. But he became more reasonable as he got accustomed to the position. However, for all we saw, we might as well have left Odnadalstind alone. From the north-east valley, whither the mountain-side fell very abruptly, came the deep roar of many fosses, subdued maybe by the fog, but still impressive; while, as if in contrast, the lowing of a single cow on the south-west side of the mountain also came to us, though infinitely lessened. The waterfalls were nothing to my guide; but when the cow lowed, he looked intelligent, and at the repetition of the sound he pricked up his ears, and informed me that it was Christina, one of his own beasts.

By this it was time to look after the opals. We had already tapped certain of the rocks during the ascent, though not in earnest. But now, beaded as to our noses, beards, and ears with fog-drops, we made our way to the site reputed most prolific in precious stones, and, in grim

sincerity, fell under the sway of jewel-fever. On our hands and knees we groped excitedly over the boulders, pulling away the moss, heather, and soil to seek those splits in the porphyry indicative of the latent existence of the stones, the more energetic parts of which were thus bursting towards the light. And, thanks to the knowledge of Johanneson, we were very soon upon the track of some promising stones. Between the boulders, where the downflow of accumulated rains had carried the earth, we espied a number of ruby particles. Digging, we discovered larger fragments; and, later, having followed the course of these minuter bits, we arrived at the block itself which by disintegration was enriching the lower soil. Here, then, the hammer and chisel came prominently into use.

Tons upon tons of the native porphyry in this locality were specked and flaked with opaline substances, and tiny jewels of very engaging colours: rich claret, clear yellow, and red-brown, flesh, milk-white, and gray. It seemed to my ignorant eyes that we were destined inevitably to release just as many stones as we pleased. But, alas, hope after hope was crushed when the hammer and chisel were brought into play. In the first place, the matrix was terribly hard; and secondly, when it did yield to Johanneson's sturdy blows, the stones embedded in it, and which had formerly looked so fine, were with it shattered all to pieces. Or when, by good luck, they came out unblemished, they proved of no depth: opaque, and therefore valueless: mere 'laminae.'

'No, no; you must not blame my mountain,' said the bonder, when a strong exclamation of disappointment had come from me: an iridescent stone like a cat's-eye had just broken asunder without the least encouragement. 'It is the way they go always; and I can tell you it asks much time and work with the chisel to gather ten opals, for which I receive one crown [thirteenpence-halfpenny] each from the Copenhagen merchants.'

I suggested an investment in dynamite as likely to be lucrative. But the bonder, when he began to understand the nature of the explosive, assumed an aghast countenance. What would become of his mountain, for which he paid the king yearly a hundred crowns, if once such a fell substance were introduced to it? And besides, it was very clear to him that the jewels would be as little likely as himself to favour the stuff: they would split, one and all, with their mother-rock. Indeed, such a train of possible evils occurred to the imagination of the bonder—for example, the destruction of his sheep and his geese, the deterioration of Christina's milk, the flight in terror of the seabirds for miles in the vicinity—that I was forced to join issue with him, and demonstrate the unlikelihood of dynamite ever being brought into common use in the Faroes. Then, in part comforted, he resumed the search for opals.

Eventually, after four or five hours' incessant labour, digging and hammering, bathed in the eternal fog all the time, we filled our pockets with jewels in better or worse condition, and for the most part environed with a lump of the hard porphyry matrix. The bonder said it was no bad day's work. But when, that evening, we submitted all our treasure to the criticism of an expert who lived in the valley, he shook his

head and pronounced sentence: 'No good!' No good, that is, as jewels: no jeweller would buy the stones for setting. On the other hand, as mere specimens, pretty and suggestive, they were very good.

On the way down, the bonder took me aside to a ledge of rock which had evidently been prospected and worked already. It was his prime depot, and he could not subject it to any diletantante mutilation. The porphyry rose in irregular tiers, two or three feet between each tier; and down its entire length ran a bright line of yellow jewel substance, which sparkled gaily through the thick atmosphere. On either side of it the rock had sprung, and the marks of Johanneson's hammer and chisel on previous occasions were very visible. He contemplated this valuable fissure with fixed eyes and swelled red cheeks; when he spoke of it, his voice was tremulous; and I could see his fingers tightening round his implements, as though they itched to be employed in real profitable toil. But with an effort he broke away from the place.

That evening I asked the good bonder how he contrived to keep such a property as Odnadalstind from despoliation.

'It is not kept so,' he exclaimed warmly. 'They go up when no one knows, and they take the stones without being allowed. And there is many a man and woman in Kollefjord who gets finer opals than I do, for all it is my own mountain, and was my father's and grandfather's before me. And when they show the stones, they say they picked them up in the valley. But it is all one lie: there is only one real opal mountain in all Faroe, and that is Odnadalstind.'

On the third day I said 'Good-bye' to my kind hosts. They could not have done more for King Christian himself than they did for me, a perfect stranger. And though I strove my utmost to convince them that by thus entertaining me with their best as a free gift they were positively wronging themselves and their children, I could not on this occasion induce them to take any money from me. Nor would they even receive thanks for their hospitality without a protest that they had done nothing deserving of thanks. The favour, they said, was on my side, not theirs. In fact, to my mind these honest, generous north-countrymen were much more interesting than the mountain of Odnadalstind, with all its hidden treasure.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

By T. W. SPEIGHT.

CHAPTER I.
